*Coral Reefs.*—The question of the evidence afforded by coral reefs as to regions of subsidence has been advanced by the large number of instances where barrier reefs and atolls have been shown to stand on the marginal areas of submarine platforms. The depth of the lagoons enclosed by coral rings appears to agree closely with the depth of the platform outside them. The platforms may in places be composed, as W. M. Davis suggests in the case of Queensland, of wave-planed coral rock of unknown thickness, and E. C. Andrews (1916) and W. C. Foye (1917) regard the reefs of Fiji as thickened during local subsidence. But Foye finds no proof of general subsidence during coral-growth in the Pacific; block-faulting has more probably occurred. T. W. Vaughan (*Bull. 103, U.S. National Museum*, 1919) discusses the whole question of the growth of reefs on platforms; the reefs have in some cases been thickened as Darwin suggested; but tectonic interest has now been shifted to the platforms. If these are of Pliocene age, they should represent an epoch of elevation and wave-erosion, and a subsequent enlargement of the oceans by subsidence. If, as R. A. Daly urges, they are Pleistocene, his "glacial control" theory may account for their origin at a time when the sea was lowered by withdrawal of water to form ice at the poles. But it is doubtful if the whole of the existing reefs are of post-Glacial age, and attention is thus redrawn to evidence of crust-movement in the platforms.

The economic importance of structural geology has been specially emphasized by numerous surveys of oil-bearing districts, and the entry of oil into anticlines and domes has been interestingly correlated in the United States with the earth pressures that caused the folding. (G. A. J. C.)

## IV. Stratigraphical Geology.

The study of comparative stratigraphy has been greatly facilitated by the publication of the *Handbuch der regionalen Geologie*, under the editorship of G. Steinmann and O. Wilckens, the first part of which, on Denmark, appeared in 1910. Written by specialists in various countries, the descriptions and bibliographies are brought fully up to date. The section on the British Isles, by 24 British geologists, was issued, as a triumph of scientific cooperation, at Heidelberg during the World War in 1917. E. Haug's *Traité de Géologie* (1908–11), with its wealth of coordinated detail, has furnished an admirable work of general reference. Attention has been given, especially in the United States, to "diastrophic" episodes, epochs of apparently world-wide earth-disturbance, and the old theories of "revolutions of the globe" have been recalled by the tendency to connect diastrophism with marked changes of fauna. Many geologists have felt that the boundaries set to geological periods may be quite justly drawn at epochs of crust-movement, which promoted rapid modifications in life-forms to suit altered conditions of existence. The continuity, however, of marine Carboniferous and Permian systems in some countries, and the break caused by the Armorican folding in Europe, serve as an example of the difficulty of calling in diastrophism as a general aid in classification. C. D. Walcott (1910) explains the abrupt appearance of the Cambrian fauna by suggesting that the marine basins of pre-Algonkian time, in which earlier faunas may be recorded, have never been elevated to form part of the land-surface. The few traces of Algonkian fossils represent lakes, or merely brief communications with oceanic waters. Walcott proposes the term *Lipalian* for the epoch when the unknown primordial fauna was adjusting itself to shore-conditions. The Lower Cambrian fauna had thus attained a high degree of differentiation when the Olenellus-beds were deposited by encroachments of the sea across the continents. In nomenclature, the adoption of the name *Silurian* by the British Geological Survey in the restricted sense has been accompanied by a general change in the same direction, while Lapworth's Ordovician has also become international. E. O. Ulrich (1911) has proposed in the United States to cut off an *Ozarkian* system from the top of the Cambrian and a *Canadian* system from the base of the Ordovician, restricting the term Ordovician to beds above the Beekmantown stage of the Champlain valley and Maryland. C. Schuchert, in his last pronouncement (1915), adopts these terms as lower subdivisions of his Ordovician system.

The frequent revision of the names of local subdivisions may be illustrated by A. W. Grabau's classification in 1909:—

| | | |
|---|---|---|
| Siluric | Upper | Monroan |
| | Middle | Salinan |
| | Lower | Niagaran |
| Ordovicic | Upper | Trentonian |
| | Middle | Chazyan |
| | Lower | Beekmantownian |

Walcott (1912) proposed *St. Croixan* for the Upper Cambrian and *Wacauban* for the Lower, thereby replacing *Saratogan* and *Georgian*. The correlation of the Cambrian and Ordovician strata throughout the United States is shown in a detailed table in a volume issued by the Maryland Geological Survey in 1919.

Pleistocene deposits, especially in relation to evidences of the antiquity of man, have attracted considerable research, and the publication of W. B. Wright's *Quaternary Ice Age* (1914) has provided a philosophic summary of recent glacial observations. The most marked advance has been the general acceptance of views in which James Geikie was one of the foremost pioneers. Widely spread deposits of boulder-clay and plains of outwash gravel are no longer attributed to the agency of floating ice, but are recognized as the unmeltable residues of glaciers of the Greenland or "continental" type, the lower layers of which may consist of 50% of material gathered from the ground in their advance. A glacial epoch is now regarded as due to a cooling of the atmosphere round all the earth, and evidence of the spread of ice in Permian times, even in tropical lands, continues to accumulate as new areas are explored. T. G. Halle (1914) has described the Permo-Carboniferous glacial beds of the Falkland Is., and proposes the name *Lafonian* for the series marked by the ancient "tillite" and by Glossopteris.

*Regional Stratigraphy.*—Among the additions to knowledge of the stratigraphy of various lands, the following may be selected as those of most importance.

In the *British Isles* the former prevalence of the Upper Cretaceous sea has received general recognition. Its deposits were easily removed by denudation, but the discovery of chalk and flints in considerable abundance on the W. coast of Ireland (Geol. Surv. Ireland, Memoir on rocks dredged from the Atlantic, 1910) and the existence of the probable Cenomanian sea-floor across Anglesey and Snowdonia

by E. Greenly (*Geol. Surv. Gt. Britain*, Geology of Anglesey, 1919) support and even amplify the view put forward by A. Jukes-Browne in the 3rd edition of his *Building of the British Isles*. Interesting Cretaceous relics are also recorded from the Isle of Arran. The revised official memoirs and maps of the South Wales coal-field and of the Edinburgh and Glasgow districts are welcome from both a scientific and an industrial point of view. In Ayrshire, shales of Millstone Grit age have been found to be rich in aluminium hydroxide, and thus to indicate a climate in Britain in Carboniferous times capable of "laterising" the surface. The Yorks. coal-field has been traced eastward and on into Notts. under its Permian Mesozoic cover, and it is estimated (W. Gibson, *Geol. Surv. Memoir*, 1913) that 5,000 ft. of Upper Carboniferous strata were removed from the area N.E. of Leeds before the Permian strata were laid down. The Bovey Tracey lignite beds have been investigated by C. and E. Reed (1910), and are held, in agreement with Heer, to be of Upper Oligocene age. The interbasaltic plant-beds of the county of Antrim are probably Oligocene rather than Eocene. The laterites and bauxites associated with them have been described in a recent memoir of the Geological Survey of Ireland, and subsequent work W. of Lough Neagh indicates that the "Lough Neagh Clays," now proved to be 1,100 ft. in thickness, may have, after all, to be removed from the Pliocene and included in the interbasaltic series. The earlier Pleistocene gravels of the S. of England have been correlated with phases of the glacial epoch, and have received renewed attention from the discussions on eoliths and from the discovery of *Eoanthropus Dawsoni* at Piltdown, N. of Lewes, in 1911–2. S. H. Warren's eolithic flints from beneath the Lower Eocene in Essex (*Quart. Journ. Geol. Soc.*, 1921, vol. 66, p. 238) dealt a sudden blow at many examples relied on.

On the borderlands of *Holland*, *Belgium*, and *Germany* considerable coal-fields have been traced by means of borings, several of which were carried by the Netherlands Government to a depth of over 1,000 metres in N. Limburg. Borings for lignite in Oligocene strata N. of Mulhouse in Alsace led to the discovery of important deposits of sylvine, which were developed for agricultural purposes in 1909, and will now supply France with an important mineral asset.

Under the auspices of the Geologische Reichsanstalt (now Staatsanstalt) of Vienna, considerable additions have been made to our knowledge of the Cretaceous as well as the older strata of *Bohemia*. The "red gneiss" of the Sudetic and Eisengebirge regions, formerly regarded as an Archaean floor, has been shown to be intrusive and of Upper Devonian or Carboniferous age. O. Ampferer and W. Hammer have published a detailed geological section of the *Eastern Alps* from Algau to the Lago di Garda (*Jahrbuch Geol. Reichs.*, vol. 61), and regard the features seen at the surface as dependent on much that is unseen below, the upper folds being the crests of masses that have sunk deeply in the crust. The *Dalmatian and Yugoslavic lands* have received much attention. The stratigraphy of *Macedonia* and southern *Serbia* has been investigated by J. Cvijić (*Petermanns Geogr. Mitt.*), and work in *Greece* may now be linked across the Aegean with that of German authors. A. Philippson (1910) finds that the W. of *Asia Minor* has been much affected by late Cainozoic faulting, to which the E. and W. ridges and the plains of the Hermus and Maeander may be attributed.

In *Russia*, J. Samojlov (*C. R. Congrès géol. internat.*, 1913) has found that the phosphorite deposits which occur over a very wide area range from Portland to Senonian horizons. The occurrence of phosphatic limestone in the Upper Cretaceous of Bohemia (J. Woldrich, *Jahrbuch Geol. Reichs.*, 1917) connects these deposits with those of Belgium. This, with the Egyptian beds above the Nubian sandstone, seems to indicate special conditions in the Cretaceous seas, perhaps connected with the evolution of bony fishes. Curiously enough, the phosphatic nodules of Silurian age in Podolia have become washed into Cretaceous strata, whence they are exploited. F. Oswald has issued (Dulau & Co., 1914) his general geological map of the Caucasus, and has described the post-Sarmatian folding on the S. flank of the chain. Upper Miocene fractures allowed of the volcanic outpourings.

For *India*, reference has been lightened by an index and bibliography of "Indian geological terminology" (*Mem. Geol. Surv. India*, vol 43, pt. 1, 1913). G. E. Pilgrim has correlated the Cainozoic river-deposits with those of Europe, as follows:—

| | |
|---|---|
| U. Siwalik | Middle to top of Pliocene. |
| M. Siwalik | Pontian to Placentian |
| L. Siwalik | Tortonian and Sarmatian |
| Murree Beds | Burdigalian to Tortonian |
| Gaj Beds | Lower Burdigalian or Upper Aquitanian. |

In Mysore, W. F. Smeeth (1913) finds that the Kolar Schists are penetrated by what was once regarded as a fundamental gneiss. The latter has, by [illegible]termining older masses, substituted a new foundation to the [illegible]ry. The existence in Pliocene (Siwalik) times [illegible] river [illegible] "Indobrahm" of E. H. Pascoe (1920), runni[illegible] the H[illegible]ayas from Assam to the Bay of Bengal, may [illegible]garded as established. Earth-movement in the W. probab[illegible]termined, the present separation of the Brahmaputra and Indus basins. M. Blanckenhorn and a number of colleagues have elaborately investigated the Pithecanthropus beds of Java (Leipsic, 1915), and regard them as formed in a fluvial period of [illegible] European times.

In *Egypt*, H. J. L. Beadnell has shown that the Nubian sandstone (Cretaceous) was deposited on crystalline rocks and penetrated by granite, probably of Eocene age, when the mountains E. of the Nile were elevated. In *Nigeria* J. D. Falconer (1911) states that the earliest unaltered sediments are Upper Cretaceous, with an underlying series of schists and quartzites and granitised gneisses. The volcanic rocks are connected with Middle Eocene and late Pliocene earth-movements. Similar conditions (C. Guillemain, *K. preuss. geol. Landesanstalt*, 1909) seem to have prevailed in Cameroon. The beds with giant dinosaurs discovered in what is now the *Tanganyika* colony can be correlated by their marine zones, and C. Schuchert places the lower horizon as early Jurassic and the upper horizons as Jurassic to Cretaceous. Dinosaurs, probably Cretaceous, are recorded from Bushmanland in the W. of the Cape Province, S. Africa. In *Uganda*, F. Oswald (1914) finds Dinotherium in Burdigalian beds. The Karroo "system" has been traced into the S. of *Nyasaland* by A. R. Andrew and T. E. G. Bailey, and into *N. Rhodesia* by A. J. C. Molyneux. A. Holmes compares the intrusive gneisses of *Mozambique* (*Quart. Journ. Geol. Soc.*, vol. 74, 1919) with the "Laurentian" of Canada. In *South Africa*, A. W. Rogers has transferred the Nieuwerust beds to the base of the Nama system, and beneath the Malmesbury series (*see* 5.229). In *South West Africa*, P. A. Wagner, in a comprehensive memoir (*Geol. Surv. S. Africa*, Mem. 7, 1916) recognizes Dwyka, Ecca, and Stormberg beds, and compares the older rocks also with those of the provinces to the east.

A notable summary of *North American stratigraphy* is given by Bailey Willis (*U.S. Geol. Surv.*, Prof. Paper 71, 1912), accompanied by a coloured map on the scale of 1:5,000,000. A. C. Lawson has returned to Rainy Lake in the W. of Ontario (*Can. Geol. Surv.*, Mem. 40, 1913), and notes that, while the "Laurentian" gneiss penetrates the Coutchiching and Keewatin series, a second gneiss cuts the Seine (Huronian) sediments. For this he proposes the name *Algoman*. The work of the Canadian Survey on intrusion, absorption, and reconstruction of rocks in the Haliburton and Bancroft areas of Ontario, and its bearing on the origin of amphibolites, has attracted much attention, and is supported by P. P. Sustschinsky (1914) by examples from S.W. Finland. In the United States the influence of massive algal growths (Cryptozoön, etc.) in building ancient limestones has been emphasized; Cryptozoön, on the other hand, has been compared by O. Holtedahl (1921) with mineral structures in the Permian limestone of Durham. The work of C. D. Walcott has greatly extended our knowledge of the Cambrian strata of the north-west. N. L. Britten and C. P. Berkey have reported (1919) on the geology of *Porto Rico*, where beds from Eocene to Miocene rest on a volcanic series probably of Cretaceous age. J. C. Branner (*Bull. Soc. Geol. America*, vol. 30, ed. 2, 1920) summarizes the geology of *Brasil*, with a map of the same scale as for N. America.

The State Geological Survey of *Western Australia* has published a geological map of the state (1918) on the scale of about 1:3,000,000. The most productive quartz reefs of the gold-fields are metasomatic replacements of schists along shear-planes. Lastly, the stratigraphy of *New Zealand* promises to be much elucidated by the careful revision of all known fossils by the Geological Survey, especially in regard to a delimitation of the Mesozoic and Cainozoic systems.

(G. A. J. C.)

**GEORGE V.** (1865– ), King of Great Britain and Ireland (*see* 11.745), succeeded to the British throne on the death of his father King Edward VII., May 6 1910. By the Regency Act 1910 (a temporary constitutional necessity in view of the fact that his eldest son, Prince Edward, was then [illegible] his consort Queen Mary was at once nominated [illegible] in the event of a demise of the Crown while the heir to the throne was under age. A new Civil List for the Crown, fixed at £470,000 a year, was approved by Parliament in 1910. An important change in the King's accession declaration was also embodied in an Act of that year, to the satisfaction of his Roman Catholic subjects, the following short and simple formula being substituted for the old "no popery" manifesto which had long been resented by them:—

"I do solemnly and sincerely in the presence of God profess, testify and declare, that I am a faithful Protestant, and that I will, according to the true intent of the enactments which secure the Protestant succession to the Throne of my Realm, uphold and maintain the said enactments to the best of my power according to law."

The coronation at Westminster Abbey on June 22 1911 was attended by representatives from all parts of the Empire and other countries, and, in order to complete the public assumption of royal authority throughout the United Kingdom, the King and Queen, with the Prince of Wales (as Prince Edward was created on June 23 1910) and Princess Mary, made State visits to Ireland, Wales and Scotland during July. There followed later in the year an important extension of the whole principle

of the recognition of Imperial sovereignty in the visit made by their Majesties to India, and the coronation ceremonies at the ancient capital of Delhi (Dec. 12 1911). They left England on Nov. 11 and did not return till Feb. 5 1912.

From the very first, King George and Queen Mary showed in all their actions their earnest desire to use their royal position in the most public-spirited manner. At the death of so active, popular and influential a sovereign as King Edward VII., in the midst of grave parliamentary difficulties, and conditions of social-economic unrest and industrial conflict, the country was fortunate in the fact that so much had already been done to establish the Throne in the hearts of the people as a central and unifying national and Imperial force, distinct and aloof from sectional interests of party or class. Under King George, the Sailor-King,—whose exhortation "Wake up, England!" in the speech he had made in 1901 at the Guildhall, when returning from his colonial tour as Duke of York, had never been forgotten—a further strengthening of this conception of the functions of the Throne was steadily pursued. King George and Queen Mary, assisted by other members of the royal family, devoted themselves on every available occasion, public or private, to the task of making the influence of the court a pure, useful and kindly one in the life of the country. It may briefly be noted that in the summer of 1912, for the first time, State visits were paid to a London music-hall (the Palace) and to Henley Regatta, while the King also went to Lord's on the occasion of the test-match between Australian and South African cricketers, and had the teams presented to him. But the King and Queen were not content with lending themselves, constantly though unostentatiously, to the scenic side of royalty; they mingled graciously and sympathetically with different classes of society, and were ever active in accepting new opportunities of service. Thus Queen Mary, after a royal visit to the Dowlais steel works at Merthyr (June 27 1912), took tea with a Welsh miner's wife, and during a tour through the industrial districts of Yorks. King George went down the Elsecar colliery (July 9 1912), and showed himself no less handy in wielding a pick than in bringing down grouse on a Scottish moor. Such incidents, which naturally attracted attention early in the reign, became too familiar with the public in later years to need chronicling in detail. The personal tastes both of King George and Queen Mary were known to lie in characteristically British domestic directions, while the King's well-known hobby of stamp-collecting[1] and his long-standing reputation as one of the best shots in the country, were typical links with popular interests of one sort or another. Facilities were wisely extended to the press to give contemporary publicity to the royal doings. Enhanced confidence resulted in the British Throne and its occupants, whose happy domestic relations were, moreover, universally appreciated.

The political history of the period from 1910 onwards is dealt with in the article ENGLISH HISTORY (*see* also BRITISH EMPIRE). With a less popular sovereign on the throne, the development of the domestic political crisis which was obviously impending when King Edward died might have created more embarrassment than actually was produced in the public mind, as regards the functioning of the Crown in relation to parliamentary government. It was generally felt, indeed, that Mr. Asquith's use of the royal prerogative in 1911, however justifiable on political grounds, in securing the King's assent to the creation of enough new peers, if necessary, for overcoming the resistance of the House of Lords to the Parliament bill, involved a more uncomfortably violent disclosure of the domination of the parliamentary executive than had ever before been regarded as *convenable* in the working of English party government. But the responsibility for the use of the royal prerogative for such a purpose was, by common consent, put upon the Government, and the political bearing of the incident on the constitutional position of the Crown was effectively minimised in the controversy between the parties. On the other hand, the value of the influence of the Crown as standing above and outside domestic party politics, continued to be emphasized, alike by such incidents as the Buckingham Palace conference in 1914 on the Irish deadlock, though unhappily abortive; by the increased momentum given throughout the British Empire to the progress of its conception as an Imperial Commonwealth of self-governing nations with a common sovereign; and by the events of the World War, during which the King and the royal family in various ways consolidated their hold on the loyal affections of the British people.

From the opening of the World War in Aug. 1914 the King and Queen, jointly and severally, set themselves to make the royal influence an encouragement to every form of national activity in aid of the fighting forces. The nation found in the Throne, from the moment when war started, the embodiment of its will-to-victory and of its patriotic devotion. Queen Mary herself gave a lead to the war work of women, details of which are given elsewhere (*see* WOMEN'S WAR WORK), in many notable directions. King George's own messages to the nation, during the war years and afterwards, were admirably conceived

[1] From his midshipman days on the "Bacchante," the King had been a keen stamp-collector, his uncle the Duke of Edinburgh having even then been hon. president of the Philatelic Society, London, and being succeeded in that position by King George (while Duke of York) in 1896. The royal collection is the completest in existence, and in 1920 the King, in a message to the Junior Philatelic Society, assured its members of his "unabated interest in stamp-collecting."

It is now purely a curious episode in the history of scandal-mongering that, at the time when King George came to the Throne, a story was current in various quarters that he had been secretly married before his marriage with the Queen, and that this earlier wife was alive, though for dynastic purposes the union was ignored. In 1893 this cruel allegation had been privately contradicted, at Queen Victoria's desire, by confidants of the royal family such as Sir Theodore Martin and Canon Dalton, in letters to various people of influence and newspaper editors (including the present writer); but it was revived, to the King's natural annoyance, and with the danger of public misconception and ill-feeling if it were not finally disproved, in 1910. It was hoped that the public contradictions authoritatively given by the Dean of Norwich (Dr. Russell Wakefield) in a speech in July 1910, by Mr. W. T. Stead in the *Review of Reviews* for that month, and by Sir Arthur Bigge (afterwards Lord Stamfordham) in *Reynolds' Newspaper* Oct. 30 1910) would put an end to it; but it was repeated in a definite way by a certain Edward Mylius in Nov. and Dec. 1910 in a republican paper called the *Liberator*, published in Paris and circulated in England under the auspices of the Indian revolutionary Hardayal Lala Lajpat Rai, Sardar Singh Rewabhai Patel and Virendranath Chattopadhyaya. In this the writer declared that the King, when a midshipman, had in 1890 married at Malta a daughter of Admiral Sir Michael Culme-Seymour; that his subsequent marriage in 1893 was therefore bigamous and shameful, and the Church, by conniving at it, had been guilty of subordinating its own principles to reasons of State. Copies of the *Liberator* were seized by the police, and Mylius was arrested and on Feb. 1 1911 tried for criminal libel before the Lord Chief Justice and a special jury. Evidence was given by Sir M. Culme-Seymour and others absolutely contradicting the whole fabrication. The admiral had no daughter whom the King could have married in 1890; one of his daughters died unmarried in 1895 without ever knowing the King, the other (Mrs. Napier) had not met him between 1879 and 1898; the King was not at Malta between 1888 and 1901; the Maltese registers were produced, and contained no record of any such marriage. Mylius refused to give evidence, his claim that the King ought to appear as a witness to be cross-examined by him being overruled; and the jury promptly found him guilty. He was sentenced to the maximum penalty of a year's imprisonment; and the attorney-general then read a statement signed by the King that he had never been married to anyone but the Queen, and that he would have attended in person to give evidence if the law officers of the Crown had not insisted that it would be unconstitutional for him to do so. The whole affair caused naturally a great sensation, but the effect was excellent, and the straightforward action taken by the King—for it was known that the Government doubted the expediency of bringing the matter into court—confirmed public opinion as to the character of the new occupant of the throne. He had insisted on having the truth told, and was not prepared to forgo his rights as a man simply because as a king he was above the law.

The exposure of this malicious libel may indeed be said to have put an end, once for all, to all forms of personal aspersion on the King's private character; for, coincidently, no less absurd stories had been current that he drank too much, a charge which was brought nonsense to all his personal friends and acquaintances, who knew him to have ever to have been the most abstemious of men. Still, instances of the gross absurdity of the charge was made, and had been publicly denounced as unfounded by the Dean of Norwich in the speech already referred to in July 1910. After the Mylius case this calumny died out into the obscurity merited.

ing, initiating or supporting the special efforts required from the public from time to time in the organization of the home front—notably his messages appealing for voluntary national service (Oct. 23 1915), compulsory military service (May 25 1916), strengthening of the volunteer forces against the risk of invasion (Jan. 27 1917), general economy in food (May 2 1917), the observance of a special day of prayer on Sunday Jan. 6 1918 (Nov. 7 1917), and those on the victory itself (Nov. 19 1918), on the need for subscriptions to the Victory Loan (June 12 1919), on the signing of the Peace Treaty (June 28 1919), appealing for support to the "King's National Roll" of employers who would take discharged soldiers into their employ (Aug. 18 1919), for the League of Nations (Oct. 13 1919), and for the celebration of the first anniversary of Armistice Day, by two minutes' silence on the 11th hour of the 11th day of the 11th month of the year (Nov. 6 1919). A collection of the King's numerous speeches and replies to addresses, and his constant messages to the Dominions and India, to the army and the navy, or in such special connexions as the repatriation of prisoners of war or the success of *The Times'* Red Cross fund, would make a bulky volume, and were always full of inspiration and good cheer for those who received them. The King and Queen regularly went in state to prorogue and open Parliament in successive sessions, and on frequent occasions royal visits were paid during the war to important factories and workshops at the munitions centres throughout the country, as well as to shipbuilding yards, hospitals and other institutions engaged in war-work of one kind or another. The King's inspections of provincial industrial establishments included visits to Glasgow and the Clyde (May 1915), Coventry and Birmingham (July 1915), Leeds and Sheffield (Sept. 1915), Nottingham (Dec. 1916), Liverpool, Manchester, Barrow and Gretna (May 1917), Newcastle-on-Tyne, Hull and Rosyth (June 1917), Glasgow for a third time (Sept. 1917), Bristol for a second time (Nov. 1917), Bradford, Huddersfield and Leeds (May 1918).

The King was also constantly inspecting the forces at home, visiting the various camps, and holding investitures for conferring honours and decorations—indeed the total number of war decorations personally conferred by him from the outbreak of war up to the end of 1919 reached the colossal figure of 50,669. Moreover, periodical visits were made by the King to the Grand Fleet (July 8–10 1915; June 18 1916; June 27 1917; and July 23 1918), and to the battle-front in France (Nov. 29–Dec. 5 1914; Oct. 21–Nov. 1 1915; Aug. 7–Aug. 15 1916; July 3–July 14 1917; March 28–30 and Aug. 5–13 1918). It was during his visit to the front in 1915 that, on Oct. 28, King George met with a somewhat serious accident, which laid him up for some weeks, through his horse rearing and falling backwards on him, being startled by the sudden cheering of a regiment whom he was inspecting; but after being safely brought back home he made a good recovery from his injuries. On the 1917 visit Queen Mary accompanied the King to France, and returned with him, but made a separate tour while there. Finally, after the Armistice, the King made another visit to Paris and to the battle-fields, Nov. 27–Dec. 10 1918, and had an enthusiastic reception in the French capital (Nov. 28–30). On each of his last two French visits a distance of about 800 m. was covered by motor-car.

In other directions during the war period, the King's desire to set an example of patriotic self-abnegation was illustrated by two specially notable actions—his announcement on March 30 1915 that the serving of alcoholic liquor for his own use and that of the royal family and household would be suspended (as from April 6), in order to assist in the movement for increased temperance and economy in wartime, and his spontaneous gift, on March 31 1916, of £100,000 to the Exchequer out of the Privy Purse, to be used as the Government might decide in relief of war expenditure. The long record of royal attendances at notable ceremonies included such occasions as the funeral services at St. Paul's for Lord Roberts (Nov. 19 1914) and Lord Kitchener (June 13 1916), the commemoration service there on the entry of the United States into the war (April 20 1917), the Albert Hall commemoration of the first Seven Divisions (Dec. 15 1917), the thanksgiving at St. Paul's on Their Majesties' silver wedding (July 6 1918), the presentation to the King at Buckingham Palace by the special Japanese mission of the sword and badge of a Japanese field-marshal (Oct. 29 1918), the U.S. navy and army baseball match at Stamford Bridge (July 4 1918), the Drury Lane matinee of the Shakespeare tercentenary celebration (May 2 1916), and Their Majesties' visit to the Bank of England and the Stock Exchange (Dec. 18 1917). On the occasion of Their Majesties' silver wedding, the King and Queen were received at the Guildhall (July 6 1918) and were presented with a cheque for £53,000, subscribed by the citizens of London, to be devoted to charities by Their Majesties' wish, together with a silver tankard once owned by Charles II.

On July 17 1917 it was announced that King George V. had abandoned all German titles for himself and his family. At the same time a proclamation was issued to the effect that henceforth the royal house of Great Britain and Ireland would be known, not as the house of Saxe-Coburg-Gotha, but as the house of Windsor. It had previously been announced (June 20 1917) that the King had decided that those princes of his family who were British subjects but bore German titles should relinquish those titles in favour of British names. The following peerages were consequently conferred:—The Duke of Teck and Prince Alexander of Teck, brothers of Queen Mary, adopted the surname of Cambridge, in allusion to their descent from the Duke of Cambridge, seventh son of George III., and became respectively Marquess of Cambridge and Earl of Athlone; Prince Louis of Battenberg (*see* 3.531), brother of Queen Victoria's son-in-law Prince Henry of Battenberg, adopted the surname of Mountbatten, and became Marquess of Milford Haven, his eldest son assuming the courtesy title of Earl of Medina; while the sons of Princess Henry of Battenberg, youngest daughter of Queen Victoria, also adopted the surname of Mountbatten, the eldest, Prince Alexander, receiving the title of Marquess of Carisbrooke. Princess Henry of Battenberg herself resumed the style of Princess Beatrice.

With the return of peace it was possible for the more normal activities of court life to be resumed on the lines already familiar before the war, but in the long list of later royal functions some stand out typically as worthy of record for their special appeal to contemporary public interest. Immediately after the Armistice in 1918, the King and Queen on successive days made popular progresses through different sections of London, and received general ovations, in carriage drives through the city (Nov. 11), to a special thanksgiving at St. Paul's (Nov. 12), through the East End (Nov. 13), the south (Nov. 14), the north (Nov. 15), the north-west (Nov. 18) and the south-west (Nov. 22). On Dec. 27 a great banquet was given in honour of President Wilson at Buckingham Palace, where he and Mrs. Wilson were staying with the King and Queen. During 1919, mention may also be made of Their Majesties' visit (March 4) to Westminster school, to witness the "tossing of the pancake" on Shrove Tuesday; the King's presentation of a cup to the New Zealand Rugby football team at Twickenham after their match against a French army team (April 19); Their Majesties' presence at the thanksgiving at St. Paul's on the signing of the Peace Treaty (July 6); and at the river procession (sea services commemoration) on the Thames (Aug. 4); the King's banquets at Buckingham Palace to the Shah of Persia (Oct. 31), to the President of the French Republic (Nov. 10), and to the Prince of Wales on his return from his world tour (Dec. 1); and the King's visit to the Oxford and Cambridge Rugby football match (Dec. 9). As time went on the King's long-standing interest in sport was indeed regularly shown by his presence at the chief popular events, whether at race meetings, football or cricket; and public appreciation of this royal interest in sport was enhanced by the way in which the Prince of Wales and the Duke of York (as the King's second son, Prince Albert, was created in 1920) were also taking an active part in it on their own account. On no such occasion was popular enthusiasm shown more emphatically than in the reception given to the King and the Duke

of York at Stamford Bridge on April 25 1921, when the King presented the Football Association's cup to the Tottenham Hotspur team on its victory over the Wolverhampton Wanderers in the final tie. On June 22–27 1921, the King and Queen visited Belfast, going and returning by sea, in order that His Majesty might inaugurate the new Northern Irish Parliament under Sir James Craig's premiership. In Dec. the engagement of Princess Mary to Viscount Lascelles, son of the Earl of Harewood, was a happy event in the Royal Family. (H. Cz.)

**GEORGE I.** (1845–1913), King of Greece (*see* 11.746), had all but completed the 50th year of his reign and was about to celebrate his jubilee (if we may believe his friend and biographer, Capt. Christmas) by abdicating the throne in favour of the Crown Prince Constantine, when he was shot down by a half-crazed Greek, named Schinas, at Salonika on March 18 1913. His assassination was at first attributed to Bulgarian instigation but after the first few days Greek public opinion dismissed this suspicion. On the other hand the crime has sometimes been attributed to Austrian and German intrigue—Austrian for political, German for dynastic reasons. This suspicion is quite unproved, although a certain atmosphere of mystery that covered the examination and the subsequent "suicide" of the assassin helped to make it popular.

It had been characteristic of King George's political acumen that in 1909 he promptly recognized Venizelos' rare ability and gave him his wholehearted support, overlooking the fact that only four years before Venizelos had practically driven the King's second son, Prince George, out of Crete, and came to Greece in 1910 with the avowed readiness to force the King himself to abdicate, if he persisted in his life-long policy of *laisser faire*. And the King's discernment was rapidly and amply justified. Internal politics played only a secondary part in King George's, as in King Otho's, reign. The Panhellenic, or "Great," idea, *i.e.* the hope of uniting all the Greek lands of the Ottoman Empire with the Greek Kingdom, had absorbed the thoughts and resources of the Greek people, ever since the recognition of the independence of Greece. King George, warned by Otho's example, and being of a totally different temperament, as well as of a far superior acumen, consistently strove, throughout his long reign, to restrain the patriotic exuberance of his subjects on the one hand, while endeavouring, on the other, to use his great personal influence and family connexions abroad in favour of the aspirations of the Greek people. As the brother-in-law of Edward VII. of England, and of Alexander III. of Russia, the uncle of Tsar Nicholas II., the friend of Francis Joseph and of Gladstone, De Freycinet and many other British and French statesmen of his day, he had the ear of those upon whose decisions European politics depended; and while he was not always able to win them to his point of view, nor to spare Greece humiliations like the blockade of 1886 or cruel disappointments like the successive phases of the Cretan question, yet it is beyond doubt that his personal influence obtained for Greece, from the Great Powers, the maximum of friendly consideration consistent with their own interests and policies. It has been said more than once that at the time of his accession to the Greek throne he was made to undertake a secret engagement toward the Powers to act as a check upon the Panhellenic agitation; and in order to strengthen his hands in this undertaking Great Britain ceded the Ionian Islands to Greece in 1864. Only once did King George depart from his pacific policy—in Feb. 1897, when he approved of Col. Vassos' expedition to Crete. In a proclamation to the nation he declared that "his patience was at an end," and that, since the Great Powers persisted in dallying with the Cretan question, he felt that the moment had come for Greece to settle it by herself. Even in Oct. 1912, when Greece, in alliance with the other Balkan states, was preparing to declare war against Turkey, King George came hurrying home from Denmark, very much opposed to this venture. Venizelos went to meet the Royal yacht at Corinth, and the vessel was kept at quarter-speed for four hours between Corinth and Piraeus while Venizelos argued and wrestled with the King to win him over to his point of view. Finally the King, still unconvinced, observed that in obedience to the constitutional principle he had no choice but to consent.

King George's violent death was thus fraught with momentous consequences for Greece and for Europe. Greece lost a sagacious sovereign, and the Anglo-French Entente a devoted friend. He was succeeded by his eldest son, as Constantine I.

See Capt. Walter Christmas, *King George of Greece* (1914).

**GEORGE, SIR ERNEST** (1839– ), English architect, was born in London June 13 1839. He began his career in the office of S. Hewitt, and at 19 became a student at the Royal Academy, where in the following year he was awarded the gold medal in architecture. He started professional practice in 1862, in conjunction with T. Vaughan, and with him carried out his earliest large commission—Rowdon, Devonshire. On his partner's death in 1871 he was joined by Harold Peto, and subsequently by Alfred Yeates. During his connexion with the former of these many of his important works were done. They were almost wholly domestic, his public buildings being inconsiderable in number, and his church work confined to a few small churches, two of them in the Engadine. Amongst the houses for which he was responsible are Buchan Hill, Sussex; Stoodleigh Court, Tiverton; Motcombe, Dorset; Rawdon House, Herts; additions to Welbeck Abbey; Crathorne Hall, Berks, a villa at Antibes, and very many others. To this short list of a few only of his country houses may be added the many town residences with which he almost formed new quarters of London, such as those in Mount Street, in Collingham Gardens, and in parts of Chelsea, and an elaborately finished house in Berkeley Square. Amongst his commercial buildings are the Royal Exchange buildings, London, the (late) Albemarle hotel, and the interesting Venetian design for Sotheran's bookshop in Piccadilly. Before he ceased to take an active part in work his last design was for a great palace for the Maharajah Holkar of Indore.

George was also a most diligent painter and water-colour artist, and the influence of his sketching work not only in England but especially in Belgium, Holland and France makes itself evident in his picturesque design. He published volumes of his etchings on the Loire, and on the Mosel and in Belgium, Venice, etc., and was a constant exhibitor of his water-colour drawings at various galleries. In 1896 he was awarded the gold medal of the Royal Institute of British Architects. In 1919 he was elected an associate of the Royal Academy, and full member in 1917, and received a knighthood in 1911.

**GEORGIA**, the former province of Russia (*see* 11.758), in 1917, in consequence of the collapse of the Russian Empire, recovered an independent position, first as part of the Federal Republic of Trans-Caucasia, and then, alone, as the republic of Georgia.

As a republic Georgia comprised the two old Russian "governments" of Tiflis and Kutais, and the "districts" of Batum and Artvin, and was contained by the range of the Caucasus Mountains in the north, the Black Sea and the Turkish frontier in the west, and the borders of the sister republics of Erivan and Azerbaijan in the south and east. As a whole the country lacks geographical unity. Only on the north and west are its frontiers natural ones; in the south and east they had not yet been determined in 1921, except in part. The eastern half of Georgia, containing the old Russian "government" of Tiflis, occupies the upper basin of the Kura, a river entering the Caspian Sea; the western half, comprising Kutais, Batum and Artvin, is drained by various smaller streams flowing to the Black Sea. Much of the country where not mountainous is very fertile; forests cover a considerable area, and the mineral wealth is great, particularly in manganese, copper and coal.

*Area and Population.*—The area of the republic is about 28,000 sq.m., but in addition are some 4,500 sq.m. in dispute with the adjoining republics of Erivan and Azerbaijan. The territory of the republic contained, by the Russian census of 1916, a pop. of 2,770,000, comprising 1,620,000 Georgians, 233,000 Russians and other Europeans, 229,000 Armenians, 249,000 Moslems, and 439,000 other elements. Territory in dispute had a pop. of about 440,000, of whom Georgians numbered perhaps 6,000, Russians and other Europeans 8,000, Armenians 50,000, Moslems 160,000, and other elements 14–15,000.

*Railway Communication.*—Possession of a coast line on the Black Sea has greatly affected the course of recent Georgian history. Owing to the configuration of sea and land in western Asia the Georgian port of Batum is the natural port not only for Georgia, Erivan and Azerbäijän but for wide regions of Central Asia. Railroad development, determined by this geographical fact, has therefore made Batum the gateway for a large part of the continent of Asia. It is in the power of Georgia to keep the gate closed or open, or to exact tolls; in fact it is in her power to penalize or favour her inland neighbours as expediency or need, friendship or hostility may move her. And the military importance of Batum is not less than the political and economic. The port is in rail communication with Erivan, with Erzerum in Asia Minor, with Tabriz in northern Persia, with Russia and with Baku in Azerbäijän; from Baku all the coast line of the Caspian Sea lies open; from Baku to Krasnovodsk is a few hours' steaming, and at Krasnovodsk begins a line of railway which runs to the Afghan frontier and the Pamirs. Whether Georgia be a weak power or a strong it cannot avoid the great influence exerted by Batum.

*The Georgian People.*—The Georgian people so placed are, as a race, the most advanced in civilization of any in Trans-Caucasia, or indeed in Asia. They have a further advantage over their neighbours in possessing a cherished tradition of comparatively recent independence. Towards the close of the 18th century a Georgian kingdom made a treaty of close alliance with Russia, whereby in return for support against the Ottoman the great northern Power guaranteed Georgian internal independence. Within 20 years, however, the terms of the treaty were violated and Georgia was incorporated as a Russian province. Although the lot of the country in these conditions was not unsatisfactory, the breach of faith was never forgotten and served to keep alive the memory of past nationhood; Georgian national consciousness therefore centres more in the State than in the race, though elsewhere in Trans-Caucasia racial consciousness predominates. Due perhaps to this wider outlook and tradition is the distinct capacity for self-government which the Georgian people showed during the early period of independence. While professing and practising an advanced form of socialism in political and economic affairs, they displayed no want of patriotic zeal, and were opposed to Bolshevism. Indeed, the resistance this small people had shown up to 1921 to intense Bolshevik propaganda and efforts at corruption was remarkable.

*Recent History.*—For the first 18 months of the World War Georgia's part was that of any Russian province; that need for independent action might arise was not so much as suspected. But in the spring of 1917 distinct signs became visible in Trans-Caucasia that a serious upheaval was fast approaching in Russia; and that an opportunity might present itself for Georgians and Armenians to obtain their independence and perhaps the independence of all Trans-Caucasia. It was recognized further that a Russian collapse would leave the Trans-Caucasian provinces open to Turkish invasion unless the people were prepared to take care of themselves. From this point events in Russia moved fast. In April the Provisional Government, established after the abdication of the Tsar, declared for the self-determination of peoples, and the conclusion of a permanent peace without indemnities. In June occurred the mutiny of the Russian Black Sea fleet at Sevastopol; and in the same month the Russian armies in Asia Minor, putting Bolshevik theories into practice, left their positions and voluntarily retired behind the pre-war Russo-Turkish frontier. Here for a time they were held together by the great personal influence of the Grand Duke Nicholas, the commander-in-chief. Russia became a republic on Sept. 15; the time had come for Trans-Caucasia to dispose of its own destinies.

Preparations had already been made in this direction. Unity of purpose existed to some extent among Georgians and Armenians, but less so on the part of the Tartars of Azerbäijän; propaganda, however, was undertaken to bring them into line with their neighbours. Representatives of the three peoples were elected in Aug. and met in Tiflis in Sept. as the "Council of the Trans-Caucasian Peoples." There, on Sept. 17, they proclaimed the Federal Republic of Trans-Caucasia.

In these events Georgian leaders, chiefly ex-members of the Russian Duma, bore a leading part; the policy followed also had a Georgian origin. Georgia, in fact, as the most advanced, populous and wealthy division of Trans-Caucasia, appeared to dominate the Federal Republic. Jealousy between the states existed from the first, and instead of diminishing it became more and more acute. Each state had its own particular aspirations to pursue, its own special difficulties to surmount; its own susceptibilities to consider, each stood out for its own point of view and seemed unable to understand the outlook of the others. Georgia desired complete independence; Erivan was under reactionary Russian influence and sought to retain some degree of Russian support; Azerbäijän with its Moslem population had leanings towards Turkey and Pan-Islamism. Both Erivan and Azerbäijän were agreed that the Federal Republic masked a Georgian ambition to incorporate them in a Georgian State. Only on one point were all the states in harmony, and that was to resist Bolshevism.

After Lenin and Trotsky had established themselves in power in Russia—Nov. 17 1917—the Russian armies in Trans-Caucasia dispersed into an armed rabble, fighting for trains to return home, and left the frontier open to Turkish invasion. The Federal Government now endeavoured to organize a force to hold the Turkish front. The old Georgian army, sent to Russia's western campaigns in 1914, were now returning, but the men had absorbed Bolshevik principles, and refused to fight anywhere except on Georgian territory, nor even then unless their committees approved. Eventually a considerable force of Georgians, Armenians, Russian volunteers and Assyrians were got together and prevented or delayed a Turkish advance for a time.

The Petrograd Government, who had not surrendered hope of retaining the Trans-Caucasian provinces, sent a chief commissary for the Caucasus to Tiflis in Jan. 1918. But he wielded no real power and was soon ejected. He then retired to Baku, and with the help of some 10,000 Armenian revolutionaries established a Bolshevik Government there, supported further by Bolshevik naval forces on the Caspian. This Russo-Armenian combination expelled and massacred the Moslem Tartars of Baku, and thus did much to estrange the Mahommedan population of Trans-Caucasia from any alliance or common action with Georgian or Armenian Christians.

On March 3 1918 Russia and Germany signed the Treaty of Brest Litovsk, which contained provisions affecting Trans-Caucasia. It awarded certain Armenian districts and the Georgian province and part of Batum to Turkey; and Turkish forces immediately advanced to occupy these areas. Batum fell into Turkish hands on April 15; on April 23 the Federal Republic, unable to offer any military resistance, began peace negotiations, and at the same time made a formal declaration of independence. But Georgia, Erivan and Azerbäijän were now alienated from one another beyond hope of agreement. Each had no other purpose than to preserve its own interests. The Azerbäijän representatives had already withdrawn from the Federal Council, and retired to Elizabetopol, where they established a form of government for their own country. On May 26 1918 the Federal Government of Trans-Caucasia was dissolved, and Georgia, Azerbäijän and Erivan became separate republics.

In this isolated situation Georgia accepted German assistance. German troops were already in Odessa and Sevastopol; [illegible] delegates came to Batum to negotiate peace between [illegible] and Georgia; and Georgia and Germany concluded an [illegible] under which German financial and military support was to be extended to the Georgian Republic. The Turkish occupation of Batum could not be terminated; but Germany undertook that Georgian rights in the port should be safeguarded, that Georgian neutrality should not be infringed. German troops were admitted to Georgia, and so long as Germany remained in Trans-Caucasia she executed the terms of her agreement with exactness, even though to the disadvantage of her Turkish ally.

The two armistices—between the Allied Powers and Turkey on Oct. 30 1918 and between the Allied Powers and Germany on Nov. 11—which ended the war changed the whole position in Trans-Caucasia. They provided for the immediate evacuation of this region by Turkish and German troops, and their replacement, for the time being, by Allied troops. In execution of these provisions a British garrison was placed in Batum on Dec. 17, and a British occupation of Trans-Caucasia was carried out to ensure the evacuation by Turks and Germans.

During the British occupation Georgian administration—which proved to be efficient—was left undisturbed except in the matter of railways. These it was found necessary to put under a British Board of Railway Control at Tiflis, owing to their interna-

tional importance, and to the increasing efforts of the Georgian Government to use them for exerting political pressure.

In Georgia, as in the other Trans-Caucasian republics, disputes upon frontiers and territorial claims became acute as soon as Russian control had ceased. One such dispute with regard to the district of Borchalinsk led to Georgia declaring war on Erivan in Jan. 1919. After long negotiations with the British general commanding in Trans-Caucasia serious hostilities were averted, and a neutral zone established; but the matter showed that unless the whole country were controlled by a dominant power there would be no settlement of such disputes except by warfare between the three republics.

At the Paris Peace Conference which opened on Jan. 18 1919 Georgian interests were represented by a delegation. For some time it seemed that the Conference would include Trans-Caucasia within the scope of its settlements; but gradually this good intention disappeared. Various ideas were considered, such as placing the whole area under a mandatory Power; but no Power willing to undertake such an onerous and thankless task could be found. The question of Batum, in particular, received much attention. The international importance of the position was realized, and a scheme embodied in a draft of the Treaty of Sèvres making the port and district a free state under the League of Nations, and giving Erivan and Azerbāijān definite rights in the port and of access by rail. But this apparently reasonable proposal was also abandoned on further consideration. The future of Trans-Caucasia, in fact, was dominated too much by Russia for any practical settlement to be attempted. Nothing would be permanent to which Russia was not a party, and for the time being no definite Russia capable of expressing herself existed. Yet whenever a reconstituted Russia emerged she would hold Trans-Caucasia in the hollow of her hand, and any settlement against her interests would be worse than wasted effort. The Peace Conference confined itself to granting *de facto* recognition to the three republics; to preventing war between them; and to embodying in the Treaty of Sèvres a provision for the settlement of the frontiers of Erivan, with Georgia and Azerbāijān. Few will hold that wisely it could have done more.

The British occupation of Trans-Caucasia continued until the end of Aug. 1919, and then, with the exception of a small garrison left in Batum, the troops were withdrawn, their mission fulfilled.

During the same year the situation in Georgia was not a little complicated by the intrigues and hostility attending Gen. Denikin's movement against Bolshevik Russia. As early as Jan. 1919 Gen. Denikin, whose headquarters were at Ekaterinodar in Cis-Caucasia, had collected nearly 200,000 men. At first he met with remarkable success. In the early autumn, indeed, it looked as if he might destroy Bolshevik rule. His armies were successful; his navies controlled the Black Sea and the Caspian; he had unlimited supplies. Throughout he viewed with extreme disfavour the independence of the Trans-Caucasian provinces, and did what he could to promote disunion and hostilities between them. He had an understanding of some kind with the Armenians of Erivan whom he encouraged and supported against Georgia, regarding that republic as the chief danger to future Russian supremacy in Trans-Caucasia. He seemed to fear that Georgia, accessible from the sea, might pass under British control and be made the foundation of a united Trans-Caucasian state, rich in oil and minerals and powerful enough, with British support, to maintain its position permanently. Towards Georgia, therefore, his policy became one of almost active hostility. He refused to recognize her flag at sea, fired on her shipping, and attacked her frontier guards. The collapse of Gen. Denikin's operations in the autumn of 1919 was the end of a reactionary movement entirely incompatible with Georgian independence.

But, Denikin out of the way, Bolshevik Russia began to push her designs in Trans-Caucasia. Propaganda and corruption on a lavish scale prepared the ground. It was not until April 1920 that active military measures were taken; but in that month the XI. Soviet Army from Cis-Caucasia moved on Baku, occupied the city without fighting, overthrew the republic of Azerbāijān, and set up a Soviet Republic. Established there, Russian troops advanced along the railway towards Georgia, intending the capture of Tiflis, but were repulsed at the frontier and found it necessary to suspend their operations. Having the Polish campaign on her hands at this time Russia was unable to press her efforts in Trans-Caucasia. She was content to wait. She signed a treaty of peace with Georgia on May 7—a provision of which recognized the district and port of Batum as Georgian territory.

The Supreme Council having abandoned the idea of creating a free state at Batum, no sufficient reason existed for retaining a British garrison there; transfer to Georgia became desirable, and was carried out on July 7 1920. An agreement, however, was made with Georgia by which she granted Erivan and Azerbāijān the same port and railway rights they would have enjoyed had Batum been under the rule of a Free State, and Erivan a special concession for a direct line of railway to the port.

The Batum area was peopled chiefly by Ajarians, a warlike Mahommedan tribe with Turkish sympathies, whose readiness in arms had previously caused Georgia considerable difficulty. These stout hillmen were now won over by giving them a form of autonomy under Georgian sovereignty.

In the summer of 1920 Georgia was able to regard her position with satisfaction and some degree of hopefulness for the future. In two years of independence she had made great national progress. Her territory was untouched by war; her internal affairs were tranquil, her Government and administration effective for her needs; her population was prosperous, and the large proportion opposed to the theories of Bolshevism, notwithstanding propaganda and the presence in Tiflis of a loud-voiced Bolshevik mission, prodigal of gold. Externally, however, her outlook was not so bright. Bolshevik Russia and Nationalist Turkey were in league, pursuing common aims, and, in effect, seeking a common frontier in Trans-Caucasia. Georgia did not stand geographically in the way of Russo-Turkish approach, but she could not fail to be affected by disaster to her Armenian neighbour who did. The difficult question for Georgia was that of support for Erivan in the event of a Russo-Turkish attack. It was complicated further by Turkey not having renounced her claims to Batum.

At the end of Sept. these matters reached a crisis. A Turkish army invaded Erivan; a Bolshevik army threatened Erivan and Georgia along the railway line leading from Baku to Tiflis. In spite of Armenian resistance, which met at first with some success Turkish troops overran Erivan; Bolshevik risings broke out in the capital and other towns, and Erivan became a Soviet Republic nominally allied with Russia. Georgia had hesitated when the danger first became evident; her people had strong instincts against military operations outside their own territory; they could not realize that their best line of defence lay not in Georgia but in Erivan; they felt, too, that resistance would have slight prospect of success. If aggression were directed against their own country they would, they believed, fare better by a policy which avoided desperate resistance than by a policy of resistance to the uttermost. They had faith in the turnings of the wheels of time.

A Bolshevik invasion of Georgia followed immediately, and simultaneously, in the usual Bolshevik way, risings proclaiming Soviet rule occurred in Tiflis and various Georgian towns. No serious resistance was attempted. The Turks reoccupied Batum; Georgia became a Soviet Republic dependent on Russia, and thus, in fact, if not at once in form, Russia had reëstablished herself in Trans-Caucasia by 1921. And she took care that her vital Trans-Caucasian seaport should not remain in Turkish hands. She insisted that it must belong to the Soviet Republic of Georgia; and the Turk gave way. (W. J. C.*)

**GEORGIA, U.S.A.** (*see* 11.751*). The pop. of Georgia in 1920 was 2,895,832 as against 2,609,121 in 1910, an increase of 11%. For the preceding decade the rate of increase was 17.9%. During 1910–20 negroes increased from 1,031,802 to 1,206,365, but relatively they decreased from 45.1% of the total pop. to 41.7%. The urban pop. was 25.1% as compared with 19.6% in 1910. The density of pop. in 1920 was 40.5 per sq. m., as against 44.4 in 1910. The census of 1920 revealed an important movement of population from the mountain counties of the northern portion of the state and from central Georgia to south-central

* These figures indicate the volume and page number of the previous article.

and south-eastern Georgia. This shifting of population was due to the presence of large areas of undeveloped and fertile land in the southern half of the state. The highest density of population, however, was still to be found in the northern half.

The following are the cities of over 25,000 inhabitants with their pop. in 1920 and 1910 and rate of increase in the decade:—

| | 1920 | 1910 | Percentage Increase |
|---|---|---|---|
| Atlanta | 200,616 | 154,839 | 29·6 |
| Augusta | 52,548 | 41,040 | 28·0 |
| Columbus | 31,125 | 20,554 | 51·4 |
| Macon | 52,995 | 40,665 | 30·3 |
| Savannah | 83,252 | 65,064 | 28·0 |

*Agriculture.*—The coming of the boll weevil and the outbreak of the World War coincided. Although scarcely perceptible in 1914, by 1916 the boll weevil had spread over the coastal plain of Georgia, and in the following years covered the entire state. The growing of long-staple cotton was abandoned and the production of the short staple was sharply curtailed, falling from 2,718,037 bales in 1914, the largest crop in the history of the state, to an average of 30% less in the four years following. This situation gave a powerful impetus to diversified farming, the movement being aided by the high prices of food-stuffs due to the World War. The production of corn jumped from 39,000,000 bus. in 1910 to 69,000,000 in 1920; Irish potatoes from 886,000 bus. to 1,628,000; sweet potatoes from 7,426,000 bus. to 13,000,000; peanuts from 2,559,000 bus. to 7,616,000; tobacco from 1,485,000 lb. to 16,000,000. Hogs increased in number from 1,945,000 in 1910 to 3,040,000 in 1919, and a number of packing plants were established. Agricultural lands advanced in price about 100%, and agricultural wages about 80%. The depression of 1920 had a very serious effect. The sudden and drastic deflation in the prices of agricultural products caused a practical moratorium of debts and led to many failures.

*Education.*—In 1910 the total enrolment in the public schools was 555,794; in 1920, 723,077; the state appropriation for elementary schools in 1910 was $2,237,000; in 1920, $4,000,000; there was raised by local taxation in 1910, $1,307,000; in 1920, $5,693,205. The total amount spent for educational purposes in 1910 was $5,400,000; in 1920, $15,540,781. This last sum included all funds from all sources. Important legislation was put upon the statute books during the period 1910–20 looking toward the modernizing of the educational system. A constitutional clause limiting the taxing power of the counties to taxation for elementary schools only was removed (1910), thus legalizing county taxation for high schools. The State Board of Education, which had been composed of state-house officials, was made into a professional board (1911), and a uniform text-book law passed, the duty of choosing the books being placed upon the board. Compulsory education dates from 1916. The law, as amended by the new School Code of 1919, was a good one, requiring attendance through the seventh grade and allowing no exemptions except of a temporary character. Provision was made for attendance officers. A training school for negro teachers was authorized in 1917. Long strides forward resulted from the Federal Smith-Lever Act of 1914, accepted by Georgia the same year, providing for extension work in agriculture and home economics, and the Federal Smith-Hughes Act of 1917, accepted the same year, for the teaching of vocational subjects in the schools. In 1919 the policy was adopted of setting apart one-half of the total income of the state for the schools. In the same year a constitutional amendment was adopted, by which the counties were required to levy local taxation of not less than one mill nor more than five mills for the support of elementary schools as a supplement to the state appropriation. An additional five mills may be voted in districts having independent school systems. To encourage the consolidation of small schools, the Legislature appropriated $100,000 from which the state offered to pay a bonus of $500 to any county which combined small schools into larger ones; and where a four-year high school was provided an additional bonus of $1,000 was authorized. An illiteracy commission was established (1919) to make a study of adult illiteracy, and in 1920 local taxation for the support of schools for adult illiterates was authorized. Noteworthy progress was being made in the eradication of illiteracy. White illiteracy declined from 7·8% to 5·4%; negro from 36·5% to 29·1%. Physical education was required (1920) in all schools supported by the state. During the 15 years after 1905 the number of four-year high schools increased from seven to 204. The progress of the elementary and high schools was far more noteworthy than that of the higher educational institutions. The latter enjoyed large increases in attendance, but very small additions to their equipment and appropriations for maintenance. The total state appropriations for higher institutions, including the academies for the deaf and blind, were, in 1919, $436,500; in 1920, $991,671.

*Government.*—The decade 1910–20 in Georgia was characterized by noteworthy legislation designed to further social progress and economic improvement. A training school for girls was established (1914), a similar school for boys having already been in operation for several years. The standard of medical education was materially raised (1913); only four-year medical colleges were recognized and the requirements for entrance were increased. A new Board of Health was established (1914) to exercise control over the county boards of health. Provision was made for paid sanitary commissioners in all sanitary districts which consist of one or more counties. A Vital Statistics law of 1914 provided for the registration of births and deaths and for the publication of statistics. Juvenile courts were established in 72 towns and cities as the result of legislation in 1915 and later. The employment of children under 14 years of age was prohibited (1914), and factory inspectors were provided in 1916. A Training School for Mental Defectives was established (1919); a Community Service Commission (1919) exercises supervision over similar county and city bodies; and a State Board of Public Welfare (1919) was set up, charged primarily with the duty of inspecting all institutions maintained by the state for the dependent, defective, delinquent, and criminal classes. An Act of 1920 provided for rehabilitation of persons disabled in industry or otherwise. This measure included assent to the Federal Vocational Act and pledged the state to equal appropriations made by the United States. A State Board of Vocational Education, created by an Act of 1917, was charged with the administration of the rehabilitation training.

In the field of economics and industry a Department of Commerce and Labor was created (1911) in which was later (1917) included a free employment bureau. The Department of Insurance dates from 1912. The State Highway Department (1916) was reconstituted in 1919 in order to bring the state system into harmony with national legislation providing aid in the construction of rural post roads. The Georgia law contemplates a state-wide system of paved highways, with a total of 4,800 m., to connect all county seats. Funds arising from the issue of motor licences (amounting in 1920 to $1,900,000) were set aside for this purpose. A Bureau of Markets (1917) was created to gather and disseminate information of value to producers and consumers of agricultural products. To further the erection of modern warehouses for the weighing, grading and storage of lint cotton, a Warehouse Commission was authorized in 1918. A new banking code, modelled on the National Bank Act, corrected many defects in the old banking system and provided for adequate inspection. An Employers' Liability Act (1920) set aside the common law defences of contributory negligence and negligence of fellow-employees and provided for compensation for industrial accidents, and a commission was created to administer the Act. A Legislative Reference Library was established in 1914, and a State Department of Archives and History in 1918.

*Finances.*—The assessed value of the taxable property of Georgia in 1910 was $766,000,000; in 1920, $1,181,473,000, an increase of 50%. The yield of taxes in 1920 was $10,820,500. The principal source of revenue was the discredited general property tax. It was estimated that about 75% of the taxable property of Georgia escaped taxation. In 1913 a Tax Equalization Act was passed with the purpose of removing inequalities as between counties and as between individuals. A Tax Commission was created the same year. Improvement resulted, but the root of the evil was not touched. An able Special Tax Commission was appointed in 1918. It recommended the classification of property for taxation purposes, but the Legislature had failed to act on the report up to the summer of 1921. The bonded indebtedness of Georgia was reduced from $6,944,000 in 1910 to $5,818,000 in 1920. The estimated value of the Western & Atlantic Railway, state-owned, was $20,000,000, or three and one-half times as much as the bonded debt.

*History.*—In politics Georgia continued throughout the period 1910–20 solidly Democratic both in state and national affairs. The most interesting political contests were those growing out of World War issues. U.S. Senator Hardwick stood for reelection in 1918. He had not supported the administration in a way acceptable to President Wilson. The President threw his support to Hardwick's opponent, William J. Harris, who was elected. By the time of the elections of 1920 a considerable reaction in sentiment had occurred. Hardwick entered the race for governor and defeated two administration candidates. Thomas E. Watson, a former Populist leader and an uncompromising opponent of President Wilson and his war policies, was elected U.S. senator over Hoke Smith and Dorsey.

The total number of soldiers furnished by the state during the World War was 86,973. Of these 20,132 voluntarily enlisted; 66,841 were taken into the service through the selective draft. The amounts subscribed to the Liberty and Victory Loans totalled $179,866,850.00. The names and dates of the governors were: Hoke Smith, 1911–2 (shortly after his inauguration Smith was elected by the Legislature to succeed J. M. Terrell as U.S. senator); Joseph M. Brown, 1912–3 (elected at a special election to fill Smith's unexpired term); John M. Slaton, 1913–5; Nathaniel E. Harris, 1915–7; Hugh M. Dorsey, 1917–21; Thomas W. Hardwick, 1921– . (R. P. B.)

**GERARD, JAMES WATSON** (1867– ), American lawyer and diplomat, was born at Geneseo, N.Y., Aug. 25 1867. He was educated at Columbia University (A.B. 1890; A.M. 1891) and at the New York Law School (LL.B. 1892). He was admitted to the bar in 1892 and began to practise in New York City. The same year he became a member of the New York National Guard, rose to captain, and served through the Spanish-American War (1898) on the staff of Gen. McKoskry Butt. From 1900 to 1904 he was quartermaster, with the rank of major, of the 1st Brigade of the New York National Guard. In 1908 he became associate justice of the Supreme Court of New York and served until 1913, when he resigned on being appointed ambassador to Germany. At the outbreak of the World War in 1914 he assumed the care of British interests in Germany, later visiting the camps where British prisoners were confined and doing much to alleviate their condition. His responsibilities were further increased by the fact that German interests in France, Great Britain, and Russia were placed in the care of the American embassies in those countries, the American embassy in Berlin thus becoming a sort of clearing house. From first-hand knowledge he was able to settle the question, much disputed among the Germans themselves, as to the official attitude of the German Government toward the violation of Belgian neutrality. At the request of von Jagow, after the fall of Liége, he served as intermediary for offering the Belgians peace and indemnity if they would grant passage of German troops through their country. On Aug. 10 1914 the Kaiser placed in his hands a telegram addressed personally to President Wilson declaring that Belgian neutrality "had to be violated by Germany on strategical grounds." At the request of a high German official this telegram was not made public as the Kaiser had wished, but was sent privately to the President. After the sinking of the "Lusitania" with many Americans on board, on May 7 1915, the American ambassador's position became more difficult, and finally, on Feb. 3 1917, diplomatic relations were broken off by America and he was recalled. He was detained for a time because of wild rumours that the German ambassador in America was being mistreated and German ships had been confiscated; but this being disproved he was allowed to depart. While in Germany in 1914 he was Democratic nominee in New York for the U.S. Senate, but without success. On his return to America in 1917 he again entered the practice of law in New York City. In 1917 he published *My Four Years in Germany* and in 1918 *Face to Face with Kaiserism*. For his services to England he was decorated with the G.C.B.

**GÉRAULT-RICHARD, ALFRED LÉON** (1860–1911), French journalist and politician (*see* 11.766), died Dec. 6 1911.

**GERMAN EAST AFRICA** (*see* 11.771).—This protectorate was conquered in 1916–7 by British and Belgian forces, and German sovereignty over it was renounced in the Treaty of Versailles. The six years immediately preceding the outbreak of the World War had been a period of much administrative and commercial activity in the protectorate, the principal achievement being the completion of the railway from the Indian Ocean to Lake Tanganyika.

According to official returns the native inhabitants in 1913 numbered 7,659,898. Europeans numbered 5,336 (compared with 1,954 in 1908), of whom 4,107 were German, 411 British (including about 300 Dutch South Africans) and 336 Greeks. Coloured persons other than natives numbered 14,898, of whom the majority were British Indians. Of the natives some 185,000 were domestic slaves. The Reichstag early in 1914 passed a resolution desiring that slavery should cease by Jan. 1 1920. To this policy of fixing a date for the emancipation of the slaves both the governor (Dr. Schnee) and the Imperial Colonial Secretary (Dr. Solf) were opposed. About 300,000 natives professed Islam; adherents of the various Christian missions numbered over 200,000. The principal towns were the seaports of Dar es Salaam and Tanga—which had in 1913 about 900 and 300 white inhabitants respectively—Tabora, on the central plateau, and Ujiji-Kigoma, on Lake Tanganyika.

The high price of Ceará rubber on the European markets led to a great increase in the number of plantations, especially in the hinterland of Tanga, where British capital was largely interested. In 1910 rubber took first place in the exports of the protectorate. Other industries much developed were sisal and coffee growing, while cotton was also cultivated on a larger scale. The increased productivity was reflected in the trade returns. In the five years 1908–12 the value of exports rose from £343,000 to £1,570,000, and that of imports from £1,289,000 to £2,515,000. A good deal of the exports passed over the Uganda railway, but Tanga, as receiving the produce of the Usambara Highlands—where lived the majority of the Europeans—handled the largest proportion.

About 54% of the trade was with Germany; India, adjoining regions of Africa, and the United Kingdom took nearly all the rest of the trade. About 90% of the shipping was in German hands. Labour on the plantations was obtained through licensed recruiters; during 1911–3 the administration introduced regulations with the object both of ensuring sufficient labour for the planter and of proper treatment of the natives engaged. Most of the natives employed in the Usambara Highlands came from distant parts of the protectorate; about 25% of them renewed their original contracts.

Much energy was shown in developing communications. The Northern or Usambara railway, with its sea terminus at Tanga, had reached New Moshi, a distance of 218 m., by 1912. The Central or Tanganyika railway, 787 m. in length, was completed in Feb. 1914. Like the Usambara line it is of metre gauge. Kigoma, a good natural harbour near Ujiji, was chosen as the lake terminus. The Government bought nearly nine-tenths of the shares of the company owning the railway. The line, running from E. to W. through the centre of the country, and supplemented by a steamboat service on Tanganyika—with over 400 m. of navigable water—afforded a very large area of east-central Africa easy access to the sea. From Tabora, through which the Tanganyika line passed, surveys were completed for a railway N. to the Kagera river on the Urundi-Ruanda border. The building of this line was begun in 1914, but construction was stopped in 1916.

Wireless telegraphic stations were opened at Mwanza and Bukoba, on Victoria Nyanza, in 1911; a high-power station at Dar es Salaam was completed in 1913 and another was erected at Tabora in 1914.

The administration was in the hands of a governor who had the aid of a council consisting of three official and 15 unofficial members elected in three districts—five for Dar es Salaam and hinterland, five for Tanga and hinterland and five for the rest of the protectorate. This council had, however, advisory powers only. Education was partly undertaken by the Government, but that of natives was largely in the hands of missionary societies, prominent among them being the Church Missionary Society and the Universities Mission.

Revenue increased from £702,000 in 1910 to £966,000 in 1912; the chief sources of revenue were customs and a hut or poll tax of three rupees per annum on all adult male natives. The expenses of the civil administration were met from local receipts; an imperial subsidy was received for military expenses, the grant in 1913 being £180,000. The budget of 1914–5, the last framed by the German authorities, balanced revenue and expenditure for the civil administration at £1,023,000, with £165,000 subsidy for military expenses.

*History.*—The result of the adoption—at the instance of Herr B. Dernburg (then Colonial Secretary) after his visit to the protectorate in 1907—of a policy based avowedly on a study of British colonial methods is seen in the progress recorded above, not least in the increase in the European population. The demarcation of the N.W. frontier in 1910 settled a long and troublesome controversy with the Belgians and British and placed almost the whole of the important sultanate of Ruanda in German territory. In Ruanda a military administration was established; the authority of the sultan was impaired, not broken.

In July 1912 Dr. Albert Schnee, an official who had served in London and in New Guinea, assumed the governorship in succession to Baron von Rechenberg. Dr. Schnee was a man of energy and it was in part due to his efforts that the Dar es Salaam railway was completed two years before scheduled time. In 1913 Dr. Schnee started a vigorous anti-Moslem campaign, apparently regarding Islam as a danger to the country. He sent a circular to all military stations asking for a report on what could be done by means of Government servants and Government teachers to counteract effectively the spread of Islamic propaganda. "Do you consider it possible," the circular added, "to make a regulation prohibiting Islam altogether? . . . The encouragement of pig-breeding among natives is recommended as an effective means of stopping the spread of Islam. Please consider this point also." And Dr. Schnee, by administrative orders, considerably harassed the important Moslem community at Dar es Salaam. This anti-Moslem attitude was dropped at the outbreak of the World War and a violently pro-Islam attitude substituted. By Dr. Schnee's authority a proclamation was widely distributed inciting the Moslems to a holy war against the British. Schnee also later on permitted the deliberately degrading treatment of British civilians interned at Tabora to

continue until, in July 1916, he realized that that place would fall into the hands of the Belgians.

Early in 1914 Lt.-Col. von Lettow-Vorbeck arrived at Dar es Salaam and took over the command of the protectorate military forces. He had just completed a tour of the country when the war broke out. Up to March 1916 the civil administration continued with little alteration, and Dr. Schnee was tenacious of his authority up to the time when in Nov. 1917 he was compelled to flee from the protectorate.

Apart from the military operations the last years of German rule in East Africa—1914–7—were remarkable for the manner in which the Germans, cut off by the British blockade from outside supplies, were able to provide for their necessities. They had indeed adventitious aid. An exhibition was to have been opened at Dar es Salaam on Aug. 12 1914 to celebrate the completion of the Tanganyika railway, and for the use of the many visitors expected large quantities of European foods had been imported. In 1914 too the natives had large stocks of corn and cattle, and the country itself furnished milk and eggs. The abundance of wild honey largely made up for the lack of sugar, and rhinoceros fat was much esteemed. But all this apart, the Germans showed much resource. They manufactured whiskey and benzine, soap, tea, chocolate, biscuits, cigars and cigarettes, paper, calico, boots and quinine.

The British and Belgians established their own administrative machinery in the regions they respectively occupied, but by a decision of the Supreme Council in May 1919 the whole of German East Africa was assigned to Great Britain as mandatory. Nevertheless, in virtue of an agreement reached in Sept. 1919 nearly the whole of the provinces of Urundi and Ruanda were added to Belgian Congo. The British-governed area—over nine-tenths of the whole protectorate—was renamed Tanganyika Territory (*see* TANGANYIKA TERRITORY).

See a valuable report by Vice-Consul Norman King, Annual Series, No. 5171, published by the British Foreign Office, 1913; *A Handbook of East Africa*, prepared for the British Admiralty, 1916; A. F. Calvert, *German East Africa* (London 1917); Gen. Smuts, "East Africa," *Geog. Jnl.* vol. li. (1918); and the authorities cited under EAST AFRICA: *Military Operations*. (F. R. C.)

**GERMAN LITERATURE** (*see* 11.783).—Between 1910 and 1921 German literature, as shown in philosophy, poetry, drama and the novel, displayed various interesting reflections of the movements of ideas.

*I. Philosophy.*—The World War and the Revolution, which alike took the most unpolitical nation of Europe by surprise, were preceded by many premonitory signs, by many preparatory intellectual conflicts, waged in the sphere of ideas, of philosophy, literature and art and not touching in their immediate implications the domain of actual facts. Long before the European catastrophe there began in Germany an intellectual reaction against the materialist view of things with its promise of power and enjoyment. Sciences which had come to be prosecuted solely on technical and specialized lines began to strive for a return to philosophy, the primal mother of them all; for there was a general longing to venerate once more something that was absolute and beyond experimental investigation, and to establish a new value for the life of the soul. The one-sided explanation of the universe given by the natural sciences and by the materialism compendiously and popularly set forth in Ernst Haeckel's *Welträtsel* was disposed of from three quarters—by the Vitalists or philosophers of the vital principle, whose forerunner was Nietzsche, by the Marburg school of philosophers, which revived Kant's transcendental idealism and by the so-called Baden school, which issued from Windelband's "systematics." The Vitalists by the mere fact of their descent from Nietzsche were a kind of romantic school. That great rhapsodist, who was far more of a poet and an artist than an abstract thinker, bequeathed to his successors an idea which has often been misrepresented, the idea of the superman, the lofty ethical ideal of the tragicman, who in spite of his sufferings affirms life, by virtue of his intellectual power which emanates from the unconscious and ever exhausts itself in the pursuit of the objects of consciousness. Halfway between Nietzsche and the French Vitalist, Bergson, stands the keen-witted analyst Georg Simmel, although he after all "turns to the idea" and seeks above biological conceptions a metaphysical value higher than life itself (*Der Konflikt der modernen Kultur; Lebensanschauung*). Wilhelm Dilthey, one of the most gifted representatives of the historical method, tries to find a bridge between the newer Vitalism and the idealism of classic German philosophy. The living conception of the world of history has for him become the totality in which individual values compensate one another and form a unity of life. Karl Joel seeks this unity beyond the limits of the biological principle in a wider conception of the "organic" (*Seele und Welt*).

Eduard Spranger lays stress upon the subjective nature of every philosophy (*Weltanschauung*) as a creative synthesis of the imagination; the philosopher always arrives at a point where he believes in himself and in nothing else. Max Scheler, a pupil of Husserl, is the spirited representative of a new attitude in his *Philosophie des Lebens*. Philosophy, he argues, must not think in general conceptions; it must avoid relations with natural science or with mathematics, neither of which can supply any direct subjective experiences; it should confine itself to history, regarding it as the autobiography of the human soul. With Oswald Spengler's *Untergang des Abendlandes*, a fascinatingly written book, this vitalistic view is further extended. Spengler represents universal history as a morphology which shows the great civilizations arising upon one another to flourish and decay. They have as little comprehension of each other as have the vegetations of different climates and have therefore produced neither a common nor an absolute value. Fritz Mauthner maintains a cooler scepticism than the elegiac exponent of our decline. According to his *Beiträge zu einer Kritik der Sprache*, men cease to understand one another as soon as they begin to speak. In his *Atheismus im Abendlande* this nihilist nevertheless acknowledges the necessity of "a mysticism without God" in the sense of Buddhism, The marriage of the Oriental with the European soul is celebrated by Count Hermann Keyserling in his *Reisetagebuch eines Philosophen*, which, like Spengler's book, became the mode. An artist and an enthusiast rather than a philosopher, Keyserling aims at awakening the divinely creative element in the human soul, and attempts the conquest of selfishness, including the self-seeking of races and nations. Encouraged by the example of Rabindranath Tagore, he founded a "School of Wisdom" at Darmstadt (1920).

Leopold Ziegler gives the question of the significance of the future of western man a deeper bearing in his *Gestaltwandel der Götter*. Gods are for him not merely Zeus or Jahwe but also the conceptions by which we are swayed, endless space and time, the law of causation or that of the conservation of energy. Ziegler makes a penetrating analysis of the religious spirit of Europe, the forces which sustain our intellectual and social life, and then shows himself to be an equally able master of synthesis in his rôle as a prophet of the mystery which invokes Buddha and Nietzsche, the mystery by which we make ourselves divine without God, the mystery ever renewed, of guilt incurred and expiated, of sacrifice and regeneration, of creation and redemption.

Compared with these individual confessions the tendencies of Mme. Blavatsky and Mrs. Annie Besant's occultism and theosophy are more superficial; but it may be mentioned that they have been distilled into an esoteric doctrine by Rudolph Steiner in his Anthroposophical Society. Steiner likewise invoked the idea of development as set forth by Goethe, who used to make short work of prophets of the occultist type such as ordinary people, particularly women, have sometimes been very ready to accept. It is noteworthy in this connexion that long before the World War the very popular travelling preacher, Johannes Müller, started under the motto, "Save thy Soul," a successful campaign against materialism and intellectualism.

As at the time of the *éclaircissement* in the 18th century, philosophy went down among the people in order to act directly as a guide to the will and to teach men how to live. Abstract philosophy naturally maintains its attitude of reserve; the problems of the theory of knowledge which are its province are not suitable for engaging the public directly in the debate. But the philosophy of the universities against which Schopen-

hauer inveighed is no longer content with historical retrospects; it has once more begun to think. It was precisely materialism and positivism that gave life to the type of thought which succeeded German classical philosophy, and which now in turn cannot rest content with the narrow biological conception of the universe held by the new Vitalists. It has once more unfurled the old Kantian banner, with the legend: God, freedom, immortality. Paul Natorp, the head of the Marburg school, no longer confined himself to pure theory but devoted himself with ideal enthusiasm to questions of education, proving a powerful antagonist to the "profoundly uncultured dogmatism and absolutism" of the mere empiricists. Ernst Cassirer, a pupil of Hermann Cohen, the founder of this school, has written a biography of Kant which takes an equally high place as a scientific treatise and as a narrative. His excellent essay, *Freiheit und Form*, is born of the spirit of Kant, Fichte and Schiller. In *Idee und Gestalt* he succeeds, like Dilthey, in once more bringing what is essential in literary phenomena under broader philosophic points of view. Besides the school of Marburg, the Baden school manifested considerable productivity; it was founded on the traditions of Kant, Fichte and Hegel, by Wilhelm Windelband, who besides his great achievements in the sphere of history, once more displayed the *Willen zum System* (the will to frame a philosophic system). His successor, Heinrich Rickert, who was in 1921 the most powerful German philosopher in the proper sense of the term, defends the universality of his science with great success against the Vitalists who followed Nietzsche and were now allied with Bergson and with the American William James. Only the first volume of his chief work, *System der Philosophie*, had appeared up to 1921; his brilliant polemical work against the *Philosophie des Lebens* is of general interest. In opposition to the Vitalists, who conceive of thought as producing itself without concepts (*unbegreiflich*) as a pure fact from the elemental event of life, Rickert insists on the necessity of seeking a system. Without mastery of the contents of thought by means of concepts there is a theoretical chaos; life does not think; it is we who think about life, which is neither the only nor the final value but only the prior condition.

While Rickert combats the absence of reflection in the Vitalists and the Intuitionists, Rudolf Eucken attacks the mechanization involved in positivism and pure psychology. Eucken's popularity was founded upon his earlier writings, *Die Grundbegriffe der Gegenwart* and *Die Lebensanschauungen der grossen Denker*. The mild humanity of his nature and the suave emotion which characterizes his method of presentation spread the devoted community of his disciples as far as America and Japan. In Germany his lead was taken up by Ernst Tröltsch, who began by being a theological writer (*Der Protestantismus; Die Sociallehren der christlichen Kirchen und Gruppen*). Tröltsch demands of the inner motive power of the Christian idea that it should put itself in gear with the actual situation of the world. Christian ethics can only persist as social ethics. The idea of the Kingdom of God does not render the world valueless; what is beyond is the power of what is here.

Philosophy has once more leavened all the mental sciences; and, especially after Rickert's constructive criticism, the historical materialism of Lamprecht's German History is no longer conceivable. Political economists, too, like Werner Sombart, and the two Heidelberg brothers, Max and Alfred Weber, are governed no longer by mere technical or commercial points of view. The Webers, especially Max, a courageous and warm-hearted ethical leader of democracy, tried to impart ideal impulses to German policy during the war and the revolution.

It is a significant fact that one of the greatest German industrialists, Walther Rathenau, who in 1921 became Minister of Reconstruction, protested against the mechanization of life under capitalism and imperialism. In his eloquent writings he calls upon the educated youth of Germany so to act as to renounce and abandon materialism, and to be masters who serve (*Zur Kritik der Zeit; Zur Mechanik des Geistes; Von Kommenden Dingen*).

*II. Poetry.*—The literature of the years 1910–21 followed the same path as philosophy, although it was not always conscious of having had the same spiritual origin. Literature, by adopting the label of Expressionism, brought itself into line with the general tendency of an international development from which it, no doubt, received impulses, but on which, in view of the plentiful crop of new and talented writers, it was not dependent. Expressionism, like philosophy, was awaiting in 1921 a final battle against Naturalism and its legacy, Impressionism and Symbolism; the movement signified a declaration of independence by the creative mind, regarded as subject, against the power of reality, the insurrection of the intelligence against nature. The Expressionist poet does not want to detach his work of art, as an organic creation with an individual character, from life, but, like the Vitalist philosopher, wishes to continue to influence life by it. A poem is a free act of the mind, an independent manifestation of the will. The ego of the poet is the only world possible for him. The Expressionist rejects all traditions, all constraint of the past; he looks solely to the future and works at evolving a new race of men as part of the mystical-religious mission.

In 1910 German lyric poetry could show three poets of a representative character, Stefan George, Rainer Maria Rilke and Richard Dehmel. Stefan George, the strictest representative of the principle of "art for art's sake"—art raised above life to the position of eternal form—founded in profane literature a kind of cult in which the sanctity of form alone is worshipped and is handed down like ancient hierophantic rites. With his own chief work, *Der siebente Ring*, however, he had apparently exhausted the possibilities of this school of the sublime. Those of his disciples who did not completely surrender themselves to an esoteric service under the dictatorship of their master were the best able to survive. Among those with most individuality and robustness, Rudolph Alexander Schröder, whose productivity is small, published a fine volume of poems, *Elysium*, in which, by the frequent employment of ancient classical metres, he aspired to the calmness and clearness of Goethe. His German Odes, which sing the land of Dürer, Beethoven and Bach, the suffering heart of Europe, revive the Hellenism of Hölderlin, which is characteristically German in sentiment.

Rudolph Borchardt, who never entirely belonged to George's circle and who chivalrously gave the master notice in order to conduct a more spirited campaign against his disciples, attained as a lyrist, in spite of his marvellous tricks of style, no greater reputation than that of being an eclectic of taste. His essays, however, in his collected works show him to be the master of a prose which promises to endure by virtue of its monumental power of expression. Like the romantic school at the beginning of the 19th century, and indeed like every movement which is solely governed by aesthetics, this movement culminates in a very exquisite critical treatment of literature, in the semi-productive activities of literary transmission and translation.

Friedrich Gundolf, whose lyric vein was soon exhausted, wrote a book on Goethe in which he sets up his own conception of that poet as an alternative to that of Houston Stewart Chamberlain, and, after having revised the old translation by Tieck and Schlegel, published his *Shakespeare und der deutsche Geist*. The lyric fountain of the gifted Hugo von Hofmannsthal seemed to have run dry; he was content to be the librettist of Richard Strauss. Yet in the melodious tenderness of his *Prosaische Schriften* there is still an echo of the lyric temperament which is his essential endowment. The special "Viennese note" which was said to characterize his youth is now discovered in Peter Altenberg, who is far more detached as regards environment or tradition, who has never, like some of his contemporaries, written a line of poetry, and has never worn the garb of a past which was the creation of his own enthusiasm. *Was der Tag mir zuträgt; Wie ich es sehe*—these titles of his first books convey the characteristics of all he has produced. This creator of numberless lyric sketches in prose is altogether identified with the present; he is the poet of the street and of the Vienna café, of all the little, unremembered meetings with anybody whomsoever, above all with himself; in short a self-revealer of a naïveté which is ready to face inspection at every moment; and in this surrender to the moment it is he who perfects Impressionism.

The mystic lyric strain of Rainer Maria Rilke could produce no school in the strict sense of the term. His peculiarly personal talent, so delicate and yet so hardy, is due to an aristocratic refinement of the nervous system, to an extreme sensibility which seems to employ almost supernatural organs of perception and vibrates like an Aeolian harp at the faintest breath (*Buch der Bilder; Stundenbuch; Neue Gedichte*).

A single plaintive cord inspired and still vibrates in the poems left by Georg Trakl, a poet who was an Austrian officer, and who, in a state of mental derangement, took his own life during the war. Apart from these, Rilke's lyric strain has found affinities only among women writers. The insatiable longing of erotic mysticism sustains the sensuous and super-sensuous poetry of Else Lasker-Schüler, who exorcised the wretchedness of her Berlin Bohemian life by the conception of an imaginary biblical East redolent of myrrh and pomegranate. She is the wistful child of nature, who dances like Salome, serves like Ruth, and is ever and again waiting with the Song of Songs for the advent of the bridegroom (*Gesichte; Mein Wunder*).

The lyric verse of Princess Mechthild Lichnowsky, governed as it is by stricter methods of construction as regards form, must likewise be described as essentially religious. In the main, the religious element has become spiritualized; it no longer devotes itself to legend and mythology. Alfred Mombert calls himself a "spirit of ethereal piety" (*einen aetherfrommen Geist*). His too incorporeal and shadowless song is an ecstatic soaring above the world to the stars (*Der Sonne-Geist; Aeon*). The more robust Theodor Däubler, who has a great following outside Germany as well as in it, sings, in the great pathetic rhapsody of his *Nordlicht*, the man born of the light, the Aryan whom the North perfects. Mombert and Däubler are forerunners of the Expressionists; their bearing is hierophantic.

The real Expressionists who aim at ethical activism present themselves as a numerous party notwithstanding their individual differences. They are united in one task at which they all seem to labour simultaneously. Tireless conspirators and literary sappers, they receive their orders from the future and acknowledge no master in even the most recent past; although Richard Dehmel is really the giant who carries their world on his mighty shoulders. It was only at rare intervals that Dehmel was a pure lyric poet, for he insisted too systematically upon symbolical significance; but it was he who developed modern German lyric poetry out of Naturalism, who once more gave it warmth, intellectual vigour, significance and dignity. The full tones of social grievance and arraignment were being sounded in 1921 by the talented Franz Werfel; but he is also a man of a metaphysical cast who in suffering and acting seeks deliverance from the ego. His poetry rolls on like a never-ceasing flood which tears hills and rocks along with it. Werfel represents love in the guise of wrath—even of wrath against himself—and as instinct with a moral power which warrants a somewhat persistent expression of strong feeling (*Wir sind; Gerichtstag; Spiegelmensch*). Akin to him in moral sentiment are Georg Heym, Kurt Heyneke, Alfred Wolfenstein and Paul Zech. They are all denizens of the great city; they sing the proletariat, the factory, suffering, vice, crime, and also the horrors of war, which many of these revolutionary spirits had anticipated by presentiment. A method of greater artistry is followed by Ernst Stadler, an Alsatian who fell in the war. His volume of poems, *Der Aufbruch*, shows a choice type of technical skill and a passion for nobility of form. Another victim of the war, a man of riper years, was Max Dauthendey, who died of homesickness on the island of Java—a quiet South German, who, after hesitating shyly on the brink, was hurled into literature by the eagerness of Dehmel. Dauthendey still maintained the old link with nature that is found in the fairy tale, the pantheistic kinship with all that grows on the earth, with the sense of wonder that inspires earlier German lyric poetry (*Das Lusamgärtlein; Die ewige Hochzeit*). Like Dauthendey, Oskar Lörke is a lyric poet whose verse is free from all "tendency" and who is entirely absorbed in his own moods, abandoning himself completely to the spirit of the moment.

It was by something of an accident that Ernst Lissauer acquired the reputation of a ferocious poet by his *Hassgesang gegen England* ("The Hymn of Hate"). His later volume of poems, *Der inwendige Weg*, manifests a great depth of intense feeling and a strength which is derived from the earth but attains the form which fashions thought.

A great deal of recent German verse, particularly that which was written during the war and the revolution, is dispersed in magazines. A small volume, *Arbeiterdichtung*, contains a collection of the finest and most popular poems in which men of the people like Karl Bröger, Max Barthels and Heinrich Lersch rallied to their country in her hour of need.

*III. The Drama.*—The German declines to regard his theatre as a matter of convention; he asks from the stage a comprehensive conception of life and from the dramatist a highly personal confession of that which is in him. The German stage has submitted to all impulses that had any significance, whether they came from Tolstoi, Ibsen, Maeterlinck, Strindberg or Bernard Shaw. It has thus become at once the battlefield and the home of all the greatest innovators. The development from Naturalism through Symbolism to Expressionism kept the stage in a constant ferment which was attended by the passionate interest of the public and by a very alert criticism. Leading managers, like Otto Brahm, Max Reinhardt, Leopold Fessner and many others, courageously adopted those tendencies which in their general aspects represent the transition from reality to idealism, from nature to style, and which, naturally, have also influenced the actor's art in the sense of the new tasks which they set him. Gerhart Hauptmann, Germany's greatest imaginative writer, experienced during 1910–21 a proud renaissance of his earlier works; it was recognized late in the day that those works of his which had been described as naturalistic were not confined to the "art of *milieu*," and that they retained the freshness of youth by virtue of their essential form. During these years Hauptmann showed himself to be occupied with a transformation of the gods, with the clarification of ethical ideas from their mythological representations. Far away from his Silesian home and from German soil, he found the subject of his new plays, *Der weisse Heiland* and *Indipodhi*, in Mexican history and in the collision between Christianity and paganism during the epoch of the conquistadores. His brother, Carl Hauptmann, who was a man of high intellect but without the same poetic power of fashioning his work, followed a parallel path to Symbolism and to the literary drama (*Stildrama*). Hermann Sudermann, whom short-sighted critics used to place on a level with Gerhart Hauptmann, now merely satisfies the daily demands of the stage by his technical ability.

Gerhart Hauptmann's naturalist successors, the North Germans, Max Halbe, Georg Hirschfeld, Otto Erich Hartleben, and the South Germans, Ludwig Thoma and Josef Ruederer, had either died or fallen silent. Moreover Thoma's literary importance rested less upon his popular comedies than upon his excellent satires, written, partly in Bavarian dialect, against reaction in Church and State (*Lausbubengeschichten; Peter Schlemihl; Briefe eines bayrischen Abgeordneten*). His dramatic campaigns against clericalism were continued by Heinrich Lautensack who died young (*Das Gelübde; Die Pfarrhauskomödie*). August Stramm, who was killed in the war, made a hopeless attempt to let mere atmosphere instead of the spoken word influence the audience; he thus effected a *reductio ad absurdum* of Naturalism and brought it almost to the verge of Expressionism.

The Suabian Hermann Essig attempted to give Naturalism a substratum of the fairy-tale element, but he lacked the dialectical energy which inevitably turns modern drama into an intellectual process. Fairy tales, legends and especially Bible stories were frequently employed. The Rhinelander, Wilhelm Schmidt of Bonn, held the stage for some time by presenting unpretentious dramatic versions of the story of the Prodigal Son and the mediaeval legend of the *Graf von Gleichen*.

Austrian dramatic art, which had still been flourishing in the year 1900, fled into past phases of civilization, especially the rococo and renaissance periods, and dallied with dreams and raptures in clever masquerades. Hugo von Hofmannsthal never

recovered the seductive charm of his youth after his play about Casanova, *Der Abenteurer und die Sängerin*, while Arthur Schnitzler, the leading representative of Viennese literature properly so called, succeeded in achieving dramatic concentration only in his one-act plays, in which there is a kind of chemical fusion between the man of the world's sceptical analysis of souls and a rare delicacy of dialogue. Hermann Bahr, who only writes poetry as a secondary occupation, mainly devoted himself to writing brilliant essays on artistic and literary subjects.

Richard Beer-Hofmann, who can claim kindred with both the last-mentioned playwrights, created in *Jaakobs Traum* an essentially lyric drama with a Zionist tendency. His earliest play, *Der Graf von Charolais*, is of interest for English readers in that it is founded upon Massinger's *The Fatal Dowry*. The Viennese Anton Wildgans had begun in his early play *Armut* to give Naturalism a literary style of its own. Other attempts at reform had already proceeded from the school of Stefan George, out of which a dramatic branch arose, little as that hierophantic master occupied himself with the profane structures of the stages.

Carl Vollmöller took a subject from the Middle Ages in his *Catherina Gräfin von Armagnac*, gave it a form something like the ballad and arranged it as if it were in strophes. From the later accretions to the Tristan legend Ernst Hardt derived his technically ingenious drama *Tantris der Narr*, which won both the Schiller Prize and a lasting success on the stage. The culmination of the romantic drama was achieved by Eduard Stucken with two mystery plays, the grail-cycle *Gawan* and *Lanval*, which lulled the German public, but only very transiently, in an atmosphere of incense. All these endeavours were directed against the supremacy of Gerhart Hauptmann, who was, from a one-sided point of view, regarded as a mere Naturalist. Paul Ernst, excellent as an essayist, trifled with experiments in an archaic style; Hermann Burte, Wilhelm von Scholz, Eberhard König, Kurt Geucke indulged in sentimental flourishes of trumpets which sounded particularly patriotic in ears that were not too sensitive; but none of these could drown the calm poetic power of Gerhart Hauptmann's voice.

Herbert Eulenberg was regarded as a hope—by many as the fulfilment of a hope; he was an absolute romanticist who turned his face away from commonplace reality, a singer of quixotic passions, who let the hot ferment of the blood course like a ceaseless melody through his lyric dramas (*Alles um Geld; Alles um Liebe; Belinde*). His personages are all poets and visionaries, bewitchers or bewitched; but the morbid beauty of his plays soon began to fade because it did not clothe any real bones and sinews of dramatic structure.

All these exponents of a new style, all these neo-romanticists, were displaced by Frank Wedekind, once he had won his way to recognition. Especially after the censorship, which had been very hostile to him, had been abolished by the revolution, he dominated simultaneously with August Strindberg the repertory of the German stage. Compared with Hauptmann's more passive or more vegetative nature, the productivity of which seems almost unconscious, Wedekind is a real fighter, a fanatic, a satanist, who exhibits with unparalleled audacity the conflict between society and the relentlessness of sexual passion. Wedekind has not designedly sought a style, because in this instance the man is the style, because he habitually speaks with his own peculiar accent of cynicism through all his personages. His world is like a circus or a theatre of marionettes, and the most natural behaviour for his characters is the grotesque. Next to the enduring work of his youth, *Frühlings Erwachen*, his plays *Erdgeist* and *Die Büchse der Pandora* and *Francisca* have had the greatest vogue, and that not least because of the audacity of the subjects with which they deal. A rival to Wedekind arose in Carl Sternheim, who, with the intention of becoming a German Molière, attacked the *bourgeoisie* in all its exhibitions of moral and social hypocrisy. His reliance upon the keenness of his dialectics makes him the sworn enemy of all naturalistic portrayal of situations. Sternheim invented for his own use a "telegraphic style" of extraordinary precision, the most laconic kind of dialogue possible (or sometimes impossible) within the limits of German grammar, a method by which every figure in the play caricatures itself. His chief plays, *Die Hose*, *Bürger Schippel*, *Der Snob* and "1913," are an unbroken series of invectives against the German *bourgeoisie*. In them the storm of war and revolution already seems to be discharging its lightnings. Sternheim's satire had been exhausted by 1921, because his method of comedy lacked the fructifying elements of love and warmth. His Impressionism, carried as it is to the extreme point, could only have Expressionism as its sequel.

The real battle for the new art, which at the same time meant an entirely new view of life, was opened in 1912 by Reinhardt Sorge's *Bettler*, shortly followed by Walter Hasenclever's *Sohn* and by Paul Kornfeld's *Verführung*. In these plays, the last vestiges of Naturalism have vanished; the *milieu* exercises no constraint; there is no longer any psychological control; even the law of causation, with which a dramatist can hardly dispense, appears to be eliminated. The new generation declares war against everything which exists. Sons kill their fathers without hesitation in the name of life, which is the sole standard of value and which wins its right to every kind of fulfilment. In *Menschen* and *Jenseits* Hasenclever almost becomes an occultist; youth declares ecstasy to be its normal condition. Under the influence of war and revolution, frequently in anticipation of them, this kind of work, inspired by spiritual aspirations and by intense emotion, includes socialist and pacifist ideas amongst those which it absorbs. This school of drama likewise attracts a kind of talent which, with a stronger inclination than its own for plastic art, originates in an older tradition. Reinhardt Göring has written a fine drama in *Seeschlacht*. The virile power of his band of six sailors, who during the battle of Jutland work and die in the turret of a battleship, substitutes concentrated lyric force for dramatic effect. Fritz von Unruh, a playwright of great talent, took the subject of his *Prinz Louis Ferdinand* from Prussian history. In his tragedy *Ein Geschlecht* all the horrors of violence have found expression. Pacificism, communism, ethical utopianism, have laid hold of this new form of dramatic art in the persons of many of its young exponents. The *motif* of humanity suffering in the mass and conducted by the poet-apostle towards a less guilty future runs through all these plays. Politically Ernst Toller and Paul Zech are extremists; H. J. Rehfisch, Hans Johst, and the sympathetic Rolf Lauckner, rather seek to mediate.

This whole development, both in its ethical and in its formal aspects, is reflected in the many-sided work of Georg Kaiser, which elastically adapts itself to every varying mood of the times. His is a talent which is spasmodic and always surprising, but which lacks the tenacity of a development governed by the will of its possessor. His dramatic method is constantly becoming more incorporeal; it resembles a crystal in which he ever finds new facets to polish. Kaiser's chief characteristic is a tempestuous speed of action, which finds its most natural expression in *Von Morgen bis Mitternacht*, the tragedy, raised to symbolic significance, of a criminal hounded to death by his vain pursuit of enjoyment. *Koralle* and *Gas* represent the end or the suicide of the industrial and capitalist age. Kaiser's nature is coldly artistic rather than ethical. The tyranny of Expressionism has seized him and carried him away. It is in the nature of this school that, being intelligence transmuted into will, its supreme object is not to produce works of art about life, but by means of art to increase the potentialities of life itself. The era of Expressionism was not yet quite over in 1921, but its cycle would be completed if the truth were once more recognized that no art can begin by designedly ignoring nature, least of all dramatic art, the business of which is and remains the portrayal of men and women.

*IV. The Novel.*—The novel in Germany during the period 1910–21 started with an imposing inheritance from the past, an inheritance for which it had to thank talented women as regards the greater part of its productivity. Clara Viebig represented Naturalism, Helene Böhlau a soulful realism, Erica von Handel-Mazzetti gave literary form to Catholic tradition, and Ricarda Huch proved herself to be a great romanticist, distinguished alike by the colour which pervades her visions and by the exquisite art of her style. The delicate talent of Count Eduard Keyserling has a temperamental element that is almost feminine; it

always reverts to the atmosphere of his Baltic homeland and to the decadent race of the last scions of aristocratic houses (*Abendliche Häuser; Fürstinnen; Wellen*). The German homeland school (a counterpart of the "Kailyard school" in Britain) was for a time the vehicle of a propaganda directed against literary centres in the great cities, but satisfied no one except the critics who had sworn allegiance to it. The Hamburg pastor Gustav Frenssen, who wrote the successful story of the peasant farmer *Jörn Uhl*, left as his successors in North Germany only the sensitive Tim Kröger and the more self-confident Hermann Löns. If the conception of an art of the homeland be applicable to Berlin, the elegiac sceptic Georg Hermann would deserve mention. With adaptive sympathy he turned to account in his *Jettchen Gebert* the popularity of the "Biedermeyer period" (1830 or thereabouts) and the characteristics of the Berlin Jewish *milieu*. Old Vienna supplies a better background than the younger capital of the German Reich. Arthur Schnitzler, in his novel *Der Weg ins Freie*, has brought out the tragic element in the life of the Jews of to-day with special reference to Austrian conditions. In his masterpiece, *Casanovas letztes Abenteuer*, he fashions the elegy of the advent of old age. More important and more fruitful than the self-conscious homeland school is that peculiar spirit and intimate life of a countryside which German literature has not only described in detail but has also warmed and fructified. In particular those quiet nooks of Suabia which are the homes of so many writers have produced an art of imaginative narrative characterized by tranquil contemplation. Emil Strauss's more important works belong to the preceding decade. Hermann Hesse experienced a second youth as a result of his familiarity with Dostoievsky and also under oriental influences (*Peter Camensind; Klingsors letzter Sommer; Demian*).

The German Swiss, who are the nearest kinsmen of the Suabians, point to the increasing but not unchallenged fame of their veteran epic poet, Carl Spitteler. The tradition of their greatest imaginative writer, Gottfried Keller, is continued by Jacob Schaffner, who was originally a working shoemaker. If he had had greater power of concentration he might have become a master in his art. His best novel, though somewhat long drawn out, is *Konrad Pilater*, a genial, wise, and peculiarly German book, instinct with cosmopolitan sympathy. Albert Steffen, in his *Bestimmung der Roheit*, plunged deeply into mysticism; this novel is a kind of modern life of a saint, a dream of the expiation of the guilt of mankind by the divine power of the soul. The great religious novel of the period, *Emanuel Quint, der Narr in Christo*, was written by Gerhart Hauptmann. He used a legend of his Silesian homeland in order to tell the story of a vagabond who thinks himself Christ come back to earth. He collects like a chronicler the contradictory reports about this remarkable case, for which there was no psychological explanation. This enables him to describe in a masterly fashion the religious atmosphere in which Messianic expectations and ecstatic visions are possible.

Hauptmann's Silesian countryman, Hermann Stehr, sets out by plunging his narrative art into the depths of mysticism; he is a visionary, with special organs of perception which find their way equally well in the fourth dimension (*Geschichten aus dem Mandelhaus; Der Heiligenhof*).

With somewhat rash enthusiasm Jacob Wassermann in his *Christian Wahnschaffe* sends out a scion of the modern plutocracy among the people, in order that, like a new St. Francis of Assisi, he may take upon himself all the sorrow and guilt of humanity. Wassermann exhibits a more trustworthy artistic instinct in his earlier novels, *Die Geschichte der jungen Renate Fuchs*, *Caspar Hauser*, and in two excellent collections of stories, *Der goldene Spiegel* and *Drei Schwestern*. His Franconian countryman, Bernhard Kellermann, whose talent is characterized by flexibility, accommodated himself, after the sensational success of his *Tunnel*, to the contemporary demand for thrilling situations with the verisimilitude of everyday life. Gustav Meyrinck acquired his sway over the public mainly by his fanciful novels *Der Golem* and *Das grüne Gesicht*. Meyrinck made occultism and satanism popular; he is a most enterprising manager in respect of his stage settings and the skilful tricks by which he blends daylight with dreams and the sensuous with the supersensuous.

The place of the novel which educates or develops was taken by the romantic variety which preceded the expressionist type. Thomas Mann, who so successfully told the tale of the *Buddenbrooks*, approximated to this type with his novel *Königliche Hoheit*, somewhat of a fairy tale in its story of the marriage of an impoverished German prince with an intellectual dollar-princess. A far more powerful performance is his *Der Tod in Venedig*, the story of a writer who comes to a tragic end as the result of an abnormal but platonic passion. A very symptomatic episode of the years of the war was the keen literary feud between Thomas Mann, who is rooted in the German tradition, and his brother, Heinrich Mann, who, as a writer, looks for his inspiration to the south and, as a politician, to the western democracies. His great cycle of novels, *Die Göttinnen*, shows the influence of D'Annunzio; the one which exhibits the greatest technical skill is *Die kleine Stadt* with its Italian climate, and its lifelike presentation of men of the south. His satirical study, *Der Untertan*, attacking the epoch of William II., has laid its justification open to challenge by the coarsening effect of its bad taste. Heinrich Mann's extreme sensualism is a stage preceding Expressionism, which, if it were consistently employed, would inevitably destroy the art of story-telling, since, without the reproduction of the circumstantial element and without connected representations of reality, that art must lose its substance. The natural consequence was that the novel recurred to past epochs of history or resorted to strange and remote scenes in order to get the desired distance from its subject. Alfred Döblin gave his *Wallenstein* the highly coloured background of the Thirty Years' War, and Max Brod laid the action of *Tycho Brahes Weg zu Gott* in approximately the same epoch of human progress.

Eduard Stucken, displaying as much knowledge as inventive ingenuity, dealt in *Die weissen Götter* with the conquest of Mexico by Ferdinand Cortez and the reciprocal infliction of religious cruelties entailed by the collision of two civilizations. Casimir Edschmid, the theoretical champion of Expressionism, likewise delights in his somewhat violent novels in the sanguinary orgies of the age of the conquistadores. The more pacific Norbert Jaques takes a refuge in a melancholy Robinson Crusoe story, *Piraths Insel*, and in the tranquillity of the South Seas.

Narrative fiction in Germany frequently mingles with the feuilleton, the essay, the description of travel. Waldemar Bonsels, a writer of versatile talent, owes his early fame to his book of travel, *Indienfahrt*, and to his *Menschenwege*, frank confessions of a vagabond. Alfons Paquet in his sketches, *Li oder der ferne Osten*, shows his penetrating knowledge of East Asia, while in his Parisian novel, *Kamerad Flemming*, he appears as a socialist with international sympathies. He is an emissary of that element in the German people which seeks its brethren throughout the whole world. At the head of this school of writers, who think in European rather than in national terms, is the Alsatian René Schickele, a journalist of merit, a lyrist, a writer of tales, a dramatist, and a man of uncommon intellectual elasticity. He regards Expressionism in an aspect transcending its literary significance and displaying it as above all an ethical movement, a manifestation of the will—the good-will—which by the fraternization of the creative minds of all nations would prepare the way for universal peace. (A. E.)

**GERMAN SOUTH-WEST AFRICA** (*see* 11.886).—This protectorate was conquered in 1915 by South African forces under Gen. Botha, and German sovereignty over it was renounced in the Treaty of Versailles. The last ten years of German rule were notable in the economic sphere for the development of the mineral resources of the country, the increasing output of copper from the Otavi and Tsumeb mines, and the exploitation of the diamond-fields in the Lüderitz Bay district.

Diamonds were first discovered in 1908 and led to an influx of Europeans, the number of whites in the country in 1913 being 14,816, of whom 12,292 were German and 2,650 *Kolonialengländer* (mostly Dutch S. Africans). In 1915 the Germans numbered 15,298. The administration, which discouraged the

settlement of non-German whites, was bureaucratic, expensive and unpopular. It spent, however, considerable sums on public works, and made efforts to promote stock-raising (for which large areas of the country are specially suited), agriculture, market-gardening and forestry. Between 1908 and 1912 a north-to-south railway, 315 m. long, was built across the central plateau and connected the lines running from Swakopmund to Windhuk and from Lüderitz Bay to Keetmanshoop. A railway (62 m.) was also built along the coast south from Lüderitz Bay to serve the diamond-fields. This was not a state line.

Fully half the capital invested in mining, land and exploration companies was, in 1913, British. In that year the mineral production was valued at £3,406,000, the whole of this trade having sprung up since 1906, when the copper mines were first worked. Diamonds were the chief export, being valued at £2,890,000. The output of diamonds increased from 483,266 carats in 1909 to 1,470,000 in 1913; up to Aug. 1914 the total value of the diamonds exported was £9,250,000. The yield of copper in 1913 was 50,000 tons, valued at £390,000. Apart from minerals, exports—mainly animal products—were practically stationary in the period 1903–13. The total exports increased from £1,103,000 in 1909 (the first year of diamond exports) to £3,515,000 in 1913; in the same period imports averaged about £2,000,000 yearly.

Revenue and expenditure were divided into ordinary and extraordinary, the latter category including military and certain public works charges. Ordinary revenue for the period 1910–4 was about £850,000 a year and was in excess of ordinary expenditure. The extraordinary expenditure was met by grants from the Imperial Government, which in 1903–14 averaged £1,490,000 per annum.

*History.*—The protectorate had a special value for Germany as being her only overseas possession where colonization by whites on a large scale was possible, and also as being a base in South Africa, both for political and economic purposes. Germany had cultivated close relations with the Transvaal Republic, and since the annexation of the Boer republics by Britain German agents had not ceased to maintain relations of a dubious character with certain sections of the Boers. Dr. T. Seitz, who was appointed governor of S.W. Africa in 1910, records that in 1911 he was in touch with "politicians of Dutch descent." In 1912 the German Government believed that the assurances given it by certain Dutch South Africans would ensure, at the least, the neutrality of South Africa in the event of an Anglo-German conflict. Dr. Seitz says that he was not so sure; he had evidence of "the mistrust by the Boers of the German race and the German character," and thought that the S.W. protectorate was threatened with as much danger from the Union of South Africa as from England herself. Seitz however continued negotiations with the Boer opponents of the British connexion. He proposed common action with them, and when the World War broke out he issued a proclamation that the Germans made war "not on the Boer people as such, but on the English and their adherents." (*See* SOUTH AFRICA: *History.*)

The opposition of a section of the South African Dutch to the operations against the Germans did not prevent the invasion and conquest of the protectorate by Gen. Botha (see *infra*), the long narrow strip of the protectorate extending E. to the Zambezi (the "Caprivi Finger") being cleared of the Germans by Rhodesian forces. Dr. Seitz states that the negotiations opened with Gen. Botha in May 1915 were merely to gain time, as he believed then that the German successes in Russia would bring a speedy peace. But the surrender two months later was a military necessity.

From July 1915 onwards the protectorate was governed by the Union of South Africa, martial law, in a mild form, being maintained until Jan. 1921. On May 7 1919 the Supreme Council had decided that the country should be assigned to the Union of South Africa under the mandatory system "C" set forth in the Covenant of the League of Nations; that is, it might be administered as an integral part of the territory of the mandatory. The terms of the mandate were approved by the Council of the League at Geneva on Dec. 17 1920. The territory was renamed the South-West Protectorate; its progress is described under SOUTH AFRICA, § *South-West Protectorate.*

See Dr. Seitz, *Südafrika im Weltkriege* (Berlin 1920); T. Tönnesen, "The South-West Africa Protectorate," *Geog. Journ.*, vol. xlix. (1917).

(F. R. C.)

### MILITARY OPERATIONS 1914–5

For some time before the year 1914 the close proximity of the German Protectorate of South-West Africa, sharing a common frontier on its southern and eastern borders with the Union of South Africa, had been recognized by the Union Government of South Africa as an important factor in its military arrangements. The sudden outbreak of war in Aug. 1914 at once converted a hypothetical situation for which tentative measures had been devised into a problem calling for immediate action.

On Aug. 6 1914 the Union Government undertook to assume all military obligations resting upon the British regular garrison in South Africa and to replace that force by Union troops. This offer was accepted by the Imperial Government, and the imperial military forces in South Africa became available elsewhere. On Aug. 10 the Union Government further undertook to send a military expedition of its own against German South-West Africa, and the seaports of that territory and the wireless installation at Windhuk were indicated by the British Government as the original objectives of the enterprise.

The position of South Africa on the ocean line of communication between Europe and Asia, and the necessity for denying friendly harbours and long-range communication to the enemy naval squadron under Admi. von Spee in the South Atlantic were obvious and imperative reasons for early action on the lines suggested. This decision of the Union Government, however, produced strong opposition on the part of a portion of the Dutch population of South Africa, and the antagonism to the proposed expedition culminated in open rebellion in Oct. 1914. Though the opposition to the Government was numerically insignificant—only some 11,500 rebels took up arms—the sporadic nature of the outbreak and the extent of the territory in which it occurred necessitated the employment of 30,000 troops (of which two-thirds were of Dutch descent) for its suppression, and delayed all offensive action across the border for four months.

Before the rebellion started the following preliminary movements had been carried out by Union troops for the prosecution of the campaign in South-West Africa. On Sept. 18 1914 a force, under Col. P. S. Beves, had been landed without opposition at Lüderitzbucht. On Aug. 31 a mixed force, under Brig.-Gen. H. T. Lukin, some 2,500 strong and including the regular mounted troops of the Union (the South African Mounted Riflemen), had begun to disembark at Port Nolloth, and, extending inland, was eventually disposed along the western portion of Union territory immediately adjoining the southern enemy border, with headquarters at Steinkopf. Farther eastward this line of observation was continued by another mixed force of approximately 1,000 rifles under Lt.-Col. Maritz with headquarters at Upington, and upon Maritz's desertion with the greater portion of his command to the enemy on Sept. 9 Col. Brits with another force took over the task which had been so shamefully abandoned. Col. Brits, called away to the Union, was soon replaced by Col. van Deventer, who, on the recall of Lukin's force on Oct. 23 to the Union, assumed sole command in the locality. Until the end of the rebellion, which was closed by the surrender of Kemp with his own and Maritz's rebel forces at Upington on Feb. 3 1915, the activities of all the forces first employed, with one exception, did not involve anything beyond outpost and reconnaissance work. A more ambitious undertaking ended in the capture of a strong advanced detachment of the South African Mounted Riflemen with two guns at Sandfontein, in enemy territory, on Sept. 26.

The beginning of Feb. 1915 then may be taken as the time of the actual commencement of offensive action by the Union forces in and against German South-West Africa. The circumstances attending the problem which confronted the South African military commanders may be briefly summarised as follows: The greater portion of what was formerly German South-West Africa—of which the area is 322,350 sq. m., or rather more than half as great again as that of the German Empire in Europe—is a high plateau 3,500 ft. above sea level. From the coast and the border adjoining Union territory, until

the gradual ascent to the plateau begins, a barren waterless tract 40 to 100 m. broad in the first case and 200 in the second formed a serious obstacle to the advance of the South African forces. Water is extremely scarce throughout the country, and is almost entirely below the surface. The water-holes were well known and at long intervals, and an advance was thus restricted to several well-defined lines. The country is very sandy and often rough, and presented formidable difficulties for every kind of transport. The climate is in the main very dry and healthful for man and beast, though the semi-tropical conditions of the N. cause the usual malaria and other diseases in the wet season. Cattle at the time of the campaign were plentiful, but all other supplies, including fodder of any kind, were scanty. The theatre of operations, badly watered, difficult to move in, devoid of adequate supplies, and protected against an advance from the Union side or the coast by a desolate belt of desert, was a powerful aid to a protracted defence by a commander falling back upon his magazines. A railway of 3 ft. 6 in. gauge ran from Lüderitzbucht to Keetmanshoop in the S., and thence N. to Windhuk, and from there westward to Karibib, with an extension to the southern portion of the Protectorate at Kalkfontein branching from the Lüderitzbucht–Keetmanshoop section at Seeheim: a total length of broad-gauge line of 800 miles. From Swakopmund, the northern port, a 2 ft. gauge railway ran to Karibib, and thence northward to Tsumeb and Grootfontein, with a total length of 420 miles. Much damage was done by the enemy to these lines and their bridges and culverts, and the Union engineers repaired 1,040 m. of railway and laid 340 m. of new line during the campaign.

The enemy regular forces consisted of approximately 140 officers and 2,000 other ranks (artillery and mounted riflemen), while about 7,000 European males of military age, of whom many had military training, were also available. An efficient camel corps proved of value, and several hundred South African rebels were also at the enemy's disposal. His one aeroplane was active until its collapse, and, with the arrival of some Union aeroplanes towards the end of the campaign, the South African troops had such advantage as was to be derived from command of the air. Of military equipment and *matériel* the German commander had abundance, and he enjoyed a substantial numerical advantage in respect of artillery.

The Union expeditionary base was formed at Cape Town, and from that place the Royal Navy conveyed, escorted and disembarked the whole of the forces and their supplies, which proceeded from South Africa to Lüderitzbucht, Walvis (Walfish) Bay and Swakopmund without the loss of a vessel or a life. Naval armoured cars also served during the operations.

Gen. Louis Botha, who, on the outbreak of the rebellion, had assumed supreme command of the forces of the Union decided personally to direct the operations in the N., and on Dec. 25 1914 the advance units of his force reached Walvis Bay under the command of Col. P. C. B. Skinner, who, on Jan. 13 1915, occupied and retained the port and town of Swakopmund. Gen. Botha reached Swakopmund, having visited the central force at Lüderitzbucht, on Feb. 11. On this date the position was as follows: The northern force—of which the greater proportion of the combatant troops was mounted, though a strong infantry force was included—occupied Walvis Bay and Swakopmund; the enemy, here controlled mainly by their chief command, holding an outpost line immediately outside the latter place. The central force, considerably augmented since its arrival in Sept. of the previous year, and now under the command of Brig.-Gen. Sir Duncan McKenzie, was at Lüderitzbucht on the coast, with its most advanced detachments at Tsaukaib, 40 m. inland, in touch with the enemy under Maj. von Bauzus on the railway line to Keetmanshoop. On the southern border, based on Upington, and organized in four, and later five, columns was the southern force, commanded by Brig.-Gen. J. Van Deventer. To this force, which was mounted, was opposed the enemy under Maj. Ritter. The eastern force, considerably smaller than the rest—it consisted of four mounted regiments with two 12-pounder guns—which was to advance on enemy territory westwards from Kuruman along the Kuruman and Molopo rivers, was in process of mobilization under Col. C. A. L. Berrange. Enemy detachments were on their eastern border at Rietfontein and Hasuur. To the Union forces heavy and field artillery were allotted as the supply available and the nature of the various tasks suggested.

To clear his immediate front and gain power of reconnaissance was Gen. Botha's first concern, and on Feb. 23 an advance in force from Swakopmund cleared the country beyond for a distance of 20 m., and Rössing on the railway and Husab on the Swakop river were permanently secured. The formation of forward supply depots was now undertaken, and, after much labour and with considerable difficulty, a longer advance was carried out terminating in successful engagements on March 18 at Riet and Pforte, in the Swakop valley, where the enemy were heavily defeated and retired with a loss of 37 killed and wounded, and 2 field guns and 9 officers and 275 other ranks captured. The Swakop river was thus secured for a distance of 60 m., and a garrison was placed at Riet. Railhead was pushed to Arandis, 30 m. from Swakopmund. The bulk of the forces were withdrawn, in view of the supply difficulty, to Swakopmund, and preparations for a similar advance were again undertaken.

The Swakop river route, recently visited by an unexpected and most welcome flood, had been selected for the main advance on Karibib and Windhuk. After a visit by the commander-in-chief to Gen. McKenzie, a second advance under Gen. Botha was made from Swakopmund and Riet on April 26, with the result that Karibib, the junction of the northern railway, was occupied on May 5 as the outcome of an advance from the Swakop river aided by a wide turning movement to the right by mounted troops, detached under Gen. Myburgh, by way of Otyimbingwe and Wilhelmstal. A determined enemy attack on the railhead at Trekkoppies on April 26 was beaten off by the garrison under Col. Skinner. The enemy opposite Gen. Botha, having withdrawn to the N. to avoid envelopment, Windhuk was occupied without opposition on May 12. The majority of the enemy European women and children were left to the care of the victors at Karibib and Windhuk.

In the meantime the central force had occupied the strong position of Aus on March 30 without fighting. The enemy, evidently apprehensive of the trend of events in the N., had retired. After some preparation Gen. McKenzie pushed strong mounted reconnaissances in the direction of Béthany (Bethanien), towards the Keetmanshoop–Windhuk railway, and, as a result of fine marching and vigorous action, engaged the only strong body of the enemy remaining in the S. at Gibeon station on April 26, the day of the second advance by Gen. Botha from Swakopmund. The enemy was roughly handled and escaped with loss and difficulty. The withdrawal of this southern enemy detachment had been prompted by the activity of the southern and eastern forces of the Union troops.

The eastern force, having set out from Kuruman on March 6, engaged the enemy successfully at Rietfontein and Hasuur, and on April 20 joined hands at Kabus with a portion of the southern force. The advance of this eastern force had only been possible as a consequence of well-planned water arrangements.

The columns of the southern force, in their advance from the southern border, defeated the enemy at Nabas on March 8, at Platbeen on March 27, and again at Kabus on April 20, when touch with the eastern force was established. These final operations in the S. were carried out under Gen. Smuts.

With the fall of the capital the whole of the country S. of it fell into the hands of the Union forces, and the enemy retired to the N. retaining no town of importance and controlling less than 200 m. of narrow-gauge railway. A conference as to terms between Gen. Botha and Gov. Seitz at Giftkuppe on May 21 proved abortive, and the final stage of the campaign against the enemy, now wholly concentrated in the N., was begun.

A large reduction of forces, reorganization, and settlement of the occupied territory were completed by June 17, and on the 18th Gen. Botha started on his final advance from Karibib. An infantry brigade, accompanied by two mounted brigades,

moved in the centre under the personal direction of the commander-in-chief, while strong mounted forces operated to the E. and W. commanded by Gens. Myburgh and Brits respectively. The enemy, constantly outflanked, retired rapidly, and on June 27 Brits was detached to make a wide and rapid detour through unknown country to the N.W. with orders to reach Namutoni before the enemy and head the latter off. Myburgh was instructed to press the enemy in towards the main advance and to swing in towards Tsumeb.

Each of these movements, though communication ceased from the time of separation from the main advance, was carried out almost to the moment, and the enemy, defeated on July 1 at Otavifontein by the leading mounted brigade of the centre, forestalled at Namutoni by Gen. Brits, and having lost Tsumeb to Gen. Myburgh, surrendered to Gen. Botha on July 9 1915.

The campaign had been won with little loss of life—127 Union soldiers were killed in the rebellion and in German South-West Africa—but it will repay study as an instance of the overcoming of difficulties in climate and terrain, and for the experience which it afforded of the value of fertility of resource and power of adaptation.

Some of the difficulties which were surmounted seemed almost impossible to deal with, and the methods adopted in connexion with water supply are worthy of the closest attention. Some magnificent marching was a striking feature of all the operations. Brits's force on the final advance marched 340 m. in 20 days; McKenzie's mounted troops covered 200 m. in 12 days; while the infantry brigade in the centre on the final northern advance in 16 days marched 236 miles. Finally, the operations indicate clearly the extraordinary mobility of mounted riflemen, who are good horsemen and horsemasters, and whose frugal habits tend enormously to simplify the difficult problem of supply in a barren country, when they are directed by a master hand. (J. J. C.)

**GERMANY** (*see* 11. 804).—The bounds of the pre-war German Empire, as constituted since its foundation on Jan. 18 1871, out of the states of the earlier North-German Confederation and the S. German states, together with Alsace-Lorraine (annexed to Germany by virtue of the Treaty of Frankfort), were materially changed in the reconstitution of the new German Reich after the World War of 1914–8. By the Treaty of Versailles in 1919 (ratified on Jan. 10 1920) Alsace and Lorraine were restored to France; in the E. the Poles, who had been made independent, had large stretches of German territory assigned to them; in the N., after a plebiscite, parts of the Prussian province of Schleswig-Holstein went to Denmark; moreover, the town of Danzig with its outlying districts and the district round Memel were separated from Germany. In the S. a small strip of territory, the little district of Hultschin, was assigned to Czechoslovakia. In the W., Germany lost the territories of Eupen and Malmédy to Belgium. By the territory ceded to Poland, Germany was now split into two parts—one W. of the Polish frontier, and the other E. of the so-called old Poland, with the Polish corridors to the Baltic, and consisting mainly of the province of E. Prussia. By the

surrender of territory in the N., Germany's northern limit was restricted to 55° 18′ N. The restoration of Alsace and Lorraine to France, however, only shifted the western frontier eastwards to an inconsiderable extent.

By the territorial alterations effected under the Treaty of Versailles, the extent of the German coast line, which previously amounted to not quite one-third of the entire frontier-line of the country, was diminished by the territories assigned to Denmark and Poland and by the districts apportioned to the free town of Danzig and the Memel district. In addition, the important seaports of Danzig and Memel were lost to Germany. As regards the frontiers dividing one country from another, the most important differences are that, in the W., since the separation of Alsace and Lorraine, the Rhine has become, to a great extent, the frontier-line between France and Germany, and that in the E., owing to the formation of the state of Poland and the establishment of the independence of the so-called border states, there is no longer any direct connexion between Germany and Russia. In the W., Germany is bounded by Holland, Belgium, Luxemburg and France; in the S., by Switzerland, Austria and Czechoslovakia; the eastern frontier is formed by Poland.

The extent of the reconstituted German Reich within these borders amounts to 473,314·9 sq. km., as compared with the 540,857·5 sq. km. of the German Empire before the conclusion of the Treaty of Versailles. The number of large towns (of over 25,000 inhabitants) had been diminished by 10, namely Strassburg, Metz, Mülhausen, Danzig, Posen, Bromberg, Thorn, Graudenz, Hohensalza and Gnesen. The number of inhabitants of the ceded territories, according to the census of Dec. 1910, was 5,579,912.

Of the self-contained river basins formerly belonging to the Empire (Rhine, Ems, Weser, Elbe, Oder, Vistula, Pregel, Memel and Danube), the basins of the Vistula and Memel, as well as the Rhine, were affected by the Treaty of Versailles. The Vistula was completely cut off from the waterways of the German Reich, and practically nothing but the mouth of the Memel remained in its possession.

*Population.*—The pop. of the German Empire, which was 41,058,792 in 1871, had increased in 1910 to 64,925,993. Table I shows the distribution of area and population at the census of Dec. 1 1910, among the 26 states:—

TABLE I.—*States of the Empire, 1910.*

| State | Area (sq. km.) | Population |
|---|---|---|
| Prussia | 348,779 | 40,165,219 |
| Bavaria | 75,870 | 6,887,291 |
| Saxony | 14,992 | 4,806,661 |
| Württemberg | 19,507 | 2,437,574 |
| Baden | 15,070 | 2,142,833 |
| Hesse | 7,688 | 1,282,051 |
| Mecklenburg-Schwerin | 13,126 | 639,958 |
| Saxe-Weimar | 3,610 | 417,149 |
| Mecklenburg-Strelitz | 2,929 | 106,442 |
| Oldenburg | 6,429 | 483,042 |
| Brunswick | 3,672 | 494,339 |
| Saxe-Meiningen | 2,468 | 278,762 |
| Saxe-Altenburg | 1,323 | 216,128 |
| Saxe-Coburg-Gotha | 1,976 | 257,177 |
| Anhalt | 2,299 | 331,128 |
| Schwarzburg-Sondershausen | 862 | 89,917 |
| Schwarzburg-Rudolstadt | 941 | 100,702 |
| Waldeck | 1,121 | 61,707 |
| Reuss (elder line) | 316 | 72,769 |
| Reuss (younger line) | 826 | 152,752 |
| Schaumburg-Lippe | 340 | 46,652 |
| Lippe | 1,215 | 150,937 |
| Lübeck | 297 | 116,599 |
| Bremen | 256 | 299,526 |
| Hamburg | 414 | 1,014,664 |
| Alsace-Lorraine | 14,521 | 1,874,014 |
| German Empire | 540,857 | 64,925,993 |

In the middle of 1914 the pop. was estimated at 67,790,000. The war, however, broke this tale of progress. The number of males killed in the war during 1914–8 is estimated at 1,800,000. A decrease in the birth-rate became more and more marked from the first quarter of 1915 onwards; and the death-rate of the civil population, notably in 1918–9 in consequence of the influenza pandemic, attained an alarming figure. By the loss of territory under the Peace Treaty a pop. of nearly 6 millions was separated from Germany. The result was that, in the census of Oct. 8 1919, the pop. of the reconstituted German Reich was shown to be 60,837,579. Of these, 28,982,137 were male and 31,855,442 female. The abnormal discrepancy in the relative numbers of the sexes (1,000 men to 1,099 women) was due to the war. In 1910 there had been only 1,026 women to 1,000 men.

Under the new constitution of the German Reich, the German Republic was composed of 18 territories (*Länder*). The distribution of the population over these territories at the end of 1920, according to the 1919 census, is shown in Table II.

TABLE II.—*Population by Territories, 1920.*

| Territory | Male | Female | Total | Per sq. km. |
|---|---|---|---|---|
| Prussia | 18,017,360 | 19,647,653 | 37,665,013 | 127 |
| Bavaria | 3,394,270 | 3,746,063 | 7,140,333 | 93 |
| Saxony | 2,168,065 | 2,495,233 | 4,663,298 | 311 |
| Württemberg | 1,195,144 | 1,323,629 | 2,518,773 | 129 |
| Baden | 1,051,405 | 1,157,098 | 2,208,503 | 146 |
| Thuringia | 712,474 | 795,551 | 1,508,025 | 128 |
| Hesse | 616,521 | 674,467 | 1,290,988 | 168 |
| Hamburg | 493,260 | 557,099 | 1,050,359 | 2,534 |
| Mecklenburg-Schwerin | 317,400 | 339,930 | 657,330 | 50 |
| Oldenburg | 250,623 | 267,142 | 517,765 | 80 |
| Brunswick | 226,400 | 254,199 | 480,599 | 131 |
| Anhalt | 157,710 | 173,548 | 331,258 | 144 |
| Bremen | 148,466 | 162,800 | 311,266 | 1,214 |
| Lippe | 71,117 | 83,201 | 154,318 | 127 |
| Lübeck | 57,539 | 63,029 | 120,568 | 405 |
| Mecklenburg-Strelitz | 51,170 | 55,224 | 106,394 | 36 |
| Waldeck | 31,065 | 35,367 | 66,432 | 59 |
| Schaumburg-Lippe | 22,148 | 24,209 | 46,357 | 136 |
| German Reich | 28,982,137 | 31,855,442 | 60,837,579 | 128 |

In the same area which showed, in 1920, a pop. of 60,837,579 there had been, in 1910, one of 59,346,081. The increase, therefore, amounted to 2·5%; but as regards males there was a decrease of 1%. During this period the growth of the population as a whole was greatest in the towns and the industrial districts. Apart from the three cities of Hamburg, Bremen and Lübeck, and their territories, Saxony was in 1920 the most densely populated territory. The next

TABLE III.—*Principal Cities, 1920.*

| Town | Territory | Population |
|---|---|---|
| Berlin | Prussia | 1,902,509 |
| Hamburg | Hamburg | 985,779 |
| Cologne | Prussia | 633,904 |
| Munich | Bavaria | 630,711 |
| Leipzig | Saxony | 604,380 |
| Dresden | Saxony | 529,326 |
| Breslau | Prussia | 528,260 |
| Essen | Prussia | 439,257 |
| Frankfort-on-Main | Prussia | 433,002 |
| Düsseldorf | Prussia | 407,338 |
| Nürnberg | Bavaria | 352,675 |
| Charlottenburg | Prussia | 322,766 |
| Hanover | Prussia | 310,431 |
| Stuttgart | Württemberg | 309,197 |
| Chemnitz | Saxony | 303,775 |
| Dortmund | Prussia | 295,026 |
| Magdeburg | Prussia | 285,856 |
| Berlin-Neukölln | Prussia | 262,127 |
| Königsberg | Prussia | 260,895 |
| Bremen | Bremen | 257,923 |
| Duisburg | Prussia | 244,302 |
| Stettin | Prussia | 232,726 |
| Mannheim | Baden | 229,576 |
| Kiel | Prussia | 205,330 |
| Halle | Prussia | 182,326 |
| Berlin-Schöneberg | Prussia | 175,092 |
| Altona | Prussia | 168,729 |
| Gelsenkirchen | Prussia | 168,557 |
| Cassel | Prussia | 162,391 |
| Elberfeld | Prussia | 157,218 |
| Barmen | Prussia | 156,326 |
| Augsburg | Bavaria | 154,555 |
| Aix-la-Chapelle | Prussia | 145,748 |
| Berlin-Lichtenberg | Prussia | 144,643 |
| Bochum | Prussia | 142,760 |
| Brunswick | Brunswick | 139,539 |
| Berlin-Wilmersdorf | Prussia | 139,406 |
| Karlsruhe | Baden | 135,952 |
| Erfurt | Prussia | 129,646 |
| Mülheim-on-Ruhr | Prussia | 127,027 |
| Crefeld | Prussia | 124,325 |
| Lübeck | Lübeck | 113,071 |
| Hamborn | Prussia | 110,102 |
| Mainz | Prussia | 107,930 |
| Plauen im Vogtland | Saxony | 104,918 |
| Münster in Westphalia | Prussia | 100,452 |

were Hesse and Baden. The least densely populated were the agricultural territories (or *Länder*) Mecklenburg, Waldeck, Oldenburg and Bavaria. Of the Prussian provinces, those of the Rhineland, Westphalia and Upper Silesia, which are mainly industrial, were the most densely populated, whilst the least densely populated were the agricultural provinces of W. Prussia, Posen, Pomerania and E. Prussia.

Corresponding to this development, there was a continuous movement between 1910 and 1920 towards the increase of the urban population. According to the 1910 census 20,374,127 (34·3%) of the total pop. were residing in towns of over 20,000 inhabitants. In 1919 this number had increased to 21,345,289 (35%).

In Table III a list is given of the principal cities of over 100,000 inhabitants according to the 1919 census.

The growth of individual German towns has varied greatly. Table IV gives index-numbers for the increase shown by the pop. in 1920, if that of 1871 is taken at 100.

TABLE IV.—*Growth of Town Population 1920 (1871 pop. = 100).*

| | | | |
|---|---|---|---|
| Berlin | 230 | Bremen | 311 |
| Hamburg | 412 | Duisburg | 800 |
| Cologne | 490 | Stettin | 305 |
| Munich | 371 | Mannheim | 579 |
| Leipzig | 565 | Kiel | 646 |
| Dresden | 299 | Halle | 346 |

| Magdeburg | 338 | Crefeld | 217 |
| Berlin-Neukölln | 3,226 | Plauen im Vogtland | 449 |
| Königsberg | 232 | | |

The figures in Table IV, however, do not adequately represent the concentration of population in the towns which took place during 1910–20. In order to form an accurate judgment of the development of the large towns and the trend towards urban life, the influence of a large town on the communities within its immediate neighbourhood must be considered. These neighbouring communities show a considerably higher rate of increase as compared with communities farther removed from the town.

It was not yet possible in 1921 to ascertain whether the trend towards the large towns was being modified by the altered conditions arising out of the World War. There were signs that this was the case. The pop. of Berlin (2,071,257 in 1910; 1,902,509 in 1920) had decreased since 1910, although not to any great extent. This retrogression, however, was likely to cease when it once more became possible for German industries to make adequate provision for their workmen. The trend towards urban life is largely identical with the trend towards the workshop. This was especially evident during the war years 1914–8; internal migration assumed enormous proportions, and was directed away from those places where the conditions of war had restricted production towards the centres of increased production arising out of direct or indirect war requirements. After the signature of the Armistice there was a wide-spread retrograde movement, still governed by prospects of production and therefore of wage-earning. At the same time rural districts experienced a not inconsiderable increase in population, and this applies above all to the great coal-mining districts of Germany, the Ruhr region, Upper Silesia and the lignite district in central Germany.

Emigration from Germany overseas had been steadily decreasing after 1891; and it was almost entirely stopped during the war. Between 1871 and 1880 the overseas emigrants had numbered 625,968; between 1881 and 1890, 1,342,423; 1891 to 1900, 529,875; and 1901 to 1910, 279,645. For later years the official figures were: 1911, 22,690; 1912, 18,545; 1913, 25,843; 1914, 11,803; 1915, 528; 1916, 326; 1917, 9; 1918, none; 1919, 3,144; 1920, 8,458.

As regards foreign immigration into Germany, no recent detailed statistics were available in 1921. But the census returns showed that on Dec. 1 1910 there were 1,259,873 foreigners in Germany. More than one-half of these were Austro-Hungarians. Holland was represented by 144,175, Russia by 137,697, Italy by 104,204, England by 8,319, France by 19,140, Switzerland by 68,257, Denmark by 26,233, Belgium by 13,455, and the United States by 17,572. In 1920 the number of foreigners in Germany was very considerable, but precise figures were wanting. The number of immigrant Russians and so-called Eastern Jews and Galicians was particularly great. The number of Germans outside Germany greatly increased after the war. In the ceded territories there were (according to the census of 1910) 3,217,053 inhabitants speaking German as their mother-tongue. These must be reckoned among the Germans resident abroad in 1920. The number of Germans abroad before the war was estimated at over 30 millions. Of these only a comparatively small proportion returned to Germany after 1918. Outside Germany itself, in 1920, the countries to be reckoned more especially as German-speaking were Austria, parts of Switzerland and Belgium, Luxemburg, Liechtenstein, and stretches of country in Czechoslovakia and in Hungary.

The inhabitants within the boundaries of the German Republic speaking other languages than German as their mother-tongue are not numerous. At the census of 1910 the question of the mother-tongue was not raised in all the states throughout the Empire. Apart from the territories of Prussia and Saxony, where the mother-tongue was ascertained, there are hardly any but German-speaking inhabitants. In Prussia in 1910 it was estimated that 3,500,621 inhabitants (8·7% of the population) spoke Polish as their mother-tongue; that 141,510 (4%) spoke Danish; that 64,766 (0·2%) spoke Wendish, and that 790,733 (2·0%) had some other mother-tongue that was not German. In Saxony the census of 1910 showed that 24,009 inhabitants (0·5%) spoke Wendish, and 35,683 (0·7%) spoke other foreign languages as their mother-tongue.

*Religion.*—Of the pop. of Germany, 61·6% were, according to the census of 1910, adherents of the Protestant, or, as it is designated in Germany, the Evangelical faith; 33·7% adherents of the Roman Catholic faith; 0·44% belonged to other Christian sects, and 0·95% were Jews. Since the census of 1890 the number of Protestant Christians had been on the decrease, and that of Roman Catholics on the increase. This was to be attributed, on the one hand, to extensive immigration from Catholic countries, and, on the other, to the fact that the Roman Catholic population increased more rapidly than the Protestant, the creed of the former having a direct influence on the birth-rate, while, in addition, the Catholic section of the population contained an immensely larger proportion of the more prolific labouring classes than the Protestant. According to the census of occupations taken in 1907, there were 680 Catholic to 1,000 Protestant wage-earning workers, but to every 1,000 Protestant salaried employees or persons engaged in occupations on their own account, there were only 527 Catholics.

Table V shows the distribution by religion within the new frontiers of Germany after the Treaty of Versailles, on the figures of the 1910 census.

TABLE V.—*Distribution of Religions.*

| Territories (1920) | Protestants (1910) | Roman Catholics (1910) | Jews (1910) | Others (1910) |
|---|---|---|---|---|
| Prussia | 23,420,842 | 12,341,123 | 378,819 | 318,537 |
| Bavaria | 2,014,876 | 4,865,373 | 55,394 | 26,466 |
| Saxony | 4,520,835 | 236,052 | 17,587 | 32,187 |
| Württemberg | 1,671,183 | 739,995 | 11,982 | 14,414 |
| Baden | 826,364 | 1,271,015 | 25,896 | 19,558 |
| Thuringia | 1,456,075 | 43,102 | 3,820 | 7,541 |
| Hesse | 848,004 | 397,549 | 24,063 | 12,435 |
| Hamburg | 929,758 | 51,036 | 19,472 | 14,398 |
| Mecklenburg-Schwerin | 615,511 | 21,043 | 1,413 | 1,991 |
| Brunswick | 464,175 | 25,888 | 1,757 | 2,519 |
| Oldenburg | 371,650 | 107,508 | 1,525 | 2,389 |
| Anhalt | 315,262 | 12,755 | 1,383 | 1,728 |
| Bremen | 259,688 | 22,233 | 1,843 | 15,762 |
| Lippe | 143,961 | 5,936 | 780 | 260 |
| Lübeck | 111,543 | 3,968 | 623 | 465 |
| Mecklenburg-Strelitz | 101,513 | 4,255 | 254 | 420 |
| Waldeck | 57,817 | 2,858 | 590 | 442 |
| Schaumburg-Lippe | 44,385 | 715 | 230 | 1,322 |
| German Reich | 38,173,442 | 20,152,404 | 547,431 | 472,804 |

At the census of 1919 the question of religion was not raised. According to the new constitution of the German Reich, no one is obliged to disclose his religious belief, unless rights or duties depend upon it, or there is a legally authorized interrogation.

*Households.*—The distribution of the population into households in 1910 was as follows:—Family households, 13,238,237 (with 61,765,065 members); single persons' households, 1,045,143; institutions, 63,312 (with 2,115,785 members). The size of family households had steadily diminished during successive decades, from 4·70 in 1871 to 4·60 in 1900 and 4·53 in 1910. There were 6,978,324 inhabited buildings in 1910, an increase of 65,703 in the decade. With the exception of the year 1913, there was great activity in building during the years 1911–4, but during the war it gradually came to almost a complete standstill. After 1919 building gradually revived, under the stimulus of the need for providing houses for the enormous number of immigrants and newly married couples; but, for the most part, it was limited to the erection of barracks, emergency dwelling-houses and small back-garden houses. This work was chiefly carried out by public enterprise. The need for new houses had not been by any means met by 1921. The number of those in search of dwellings was continually on the increase. In 1918, in order to form an estimate of the number of empty houses available and of the extent of the housing need, a housing census for the whole Reich was taken. It covered 3,782 communities, mostly the largest ones, and comprised 9,176,137 houses inhabited by 32,330,668 persons, or 55·5% of the total civil population of Germany. By this census it was ascertained that only in the smallest portion of the region under examination were there more than 3% empty houses available. The shortage which arose after the signing of the

Armistice, due to the great number of immigrants and of persons expelled from foreign states, and to the high marriage-rate, could only be met in an approximate degree by the extensive adoption of a system of house-rationing and compulsory billeting.

*Vital Statistics.*—The great increase in the population of the German Empire up to the beginning of the 20th century was mainly due to a high birth-rate. Between 1870 and 1900 the birth-rate maintained a level of 36–9 per 1,000 of the average population during that period. An average of 1,800,000 children were born alive annually. The average surplus of births over deaths amounted approximately to 600,000 annually. The comparative lowness of the birth surplus, if the high level of the birth-rate be taken into consideration, was due to the rather unsatisfactory death-rate. During the three decades 1870–1900 the death-rate fluctuated between 21·7 and 31·0 per 1,000 of the average population. From 1900 onwards the birth-rate was steadily on the decrease, and in 1914 it was only 26·8 per 1,000 of the average population. Simultaneously, however, the death-rate declined, not only owing to a lower death-rate among adults, but also because of a considerable decrease in infant mortality. The death-rate as a whole declined from 23·2 per 1,000 in 1900 to 15·8 in 1913, and infant mortality from 207 per 1,000 infants born alive to 151. In spite of the declining birth-rate, therefore, the surplus of births over deaths remained at the same level as heretofore. The birth surplus did not entirely cease until a few years before the outbreak of the World War. During the war the birth-rate and the rate of mortality were greatly affected by war conditions. From the middle of 1915 the birth-rate dropped rapidly and reached its lowest point in 1917, namely 13·9 per 1,000 of the population. In this year only 912,109 children were born alive. The rate of mortality rose during the same period. This was due, on the one hand, to the heavy losses by casualties, and, on the other, to the high rate of mortality among civilians, whose health had been greatly weakened by the blockade. The highest death-rate was in 1918, when, partly owing to the influenza pandemic, it rose to 24·7. After the Armistice the birth-rate began to recover, and from the middle of 1919 it rose with great rapidity, 1,512,162 children being born alive in 1920 (26·3 per 1,000 of the pop.), with a surplus of 623,367 births over deaths in that year, the death-rate having sunk practically to the pre-war level. Infant mortality, which in 1913 was 151 per 1,000 born alive, was 164 in 1914, 154 in 1915, 136 in 1916, 150 in 1917, 154 in 1918, 121 in 1919, and 131 in 1920.

For every 1,000 female infants born alive the number of male infants was 1,053 in the year 1910, 1,055 in 1915, and 1,080 in 1919. The reasons for this rise in the proportion of male infants have not been fully ascertained; it may probably be attributed to the decrease in the number of infants born dead. The rate of stillbirths (number born dead per 100 births) had declined from 3·1 in 1900 to 2·99 in 1919, though it rose again to 3·2 in 1920. In the case of stillborn infants, the proportion of the sexes is approximately 100 females to 127 males. A decline in the rate of stillbirths would therefore result in increasing the proportion of male infants born alive.

During the three decades 1871–1900, approximately 90% of the infants born alive were legitimate and 10% illegitimate. The proportion of illegitimate births has been almost continuously on the increase since 1903. During the war the increase was especially marked. The cause of this increase is to be traced, not so much to a rise in the number of illegitimate births as to the comparatively larger decrease in the number of legitimate births. The number of illegitimate infants to every 1,000 infants born was 91 in 1910, 98 in 1914, 112 in 1915, 115 in 1917, 131 in 1918, and 112 in 1919.

In 1920 the marriage-rate was 7·7 per 1,000 of the population. During the war, the number of marriages decreased materially (4·1 in 1915 and 1916, 4·7 in 1917, 5·4 in 1918); but there was a great increase afterwards (13·9 in 1919, 14·8 in 1920). The number was particularly great in the second quarter of 1920.

Divorces have increased both absolutely and relatively. In 1910 there were 23·3 divorces per 100,000 inhabitants; in 1914 the number had risen to 26·2, and in 1919 it had reached 36·2.

*Occupations.*—Table VI shows the division of the population in 1920 according to occupations, on a basis corresponding to that of the census of occupations taken in 1907.

TABLE VI.—*Occupation in 1920.*

| | Total population | Persons whose emolument is derived from their chief occupation | Members of their families and their domestic servants |
|---|---|---|---|
| A. Agriculture and forestry | 15,271,767 | 8,671,666 | 6,600,101 |
| B. Industry and mining | 24,833,853 | 10,600,512 | 14,233,341 |
| C. Commerce and traffic; hotel-keeping | 7,730,501 | 3,256,063 | 4,474,438 |
| D. Hired labour, various kinds; personal service | 723,292 | 435,633 | 287,659 |
| E. Public service; professions | 3,051,149 | 1,523,424 | 1,527,725 |
| A–E. | 51,610,562 | 24,487,298 | 27,123,264 |
| F. Unemployed | 4,764,028 | 3,141,916 | 1,622,112 |
| A–F. Total population | 56,374,590 | 27,629,214 | 28,745,376 |

As compared with the Germany of 1907, the agricultural side had in 1920 been somewhat reduced and the industrial enlarged.

*Agriculture.*—In 1913 an inquiry was held as to the way in which the cultivation of the land was distributed. Table VII gives an application of its results to the territories of the Reich as constituted after the war.

By the cession of territory under the Peace Treaty Germany forfeited 14·8% of its arable land and 24% of its vineyards. About one-quarter of the total land of the newly constituted Reich is forest; approximately one-half of the total forest land consists of privately owned forests and the other half, for the most part, of state and communal forests. Two-thirds of the woods consist of conifers. The pine tree is the most common of these; not more than one-third of these coniferous woods consists of trees other than pines. Of this third the larger proportion is formed of fir trees. Of deciduous trees, beeches are the most numerous. One-fifth of the timber is oak. N. Germany is not so rich in forests as central and S. Germany. All the smaller mountain ranges, such as the Black Forest range, the Thuringian and Oden ranges, are wooded. To the N. there is a small stretch of land along the Baltic covered with oaks and beeches. There are practically no forests in the N.W.; in that region wide stretches of peat-moor predominate.

According to the harvest statistics for Nov. 1920 the chief products of the arable land were cultivated over the following areas (in hectares):—wheat, 1,381,274; rye, 4,325,247; spelt and winter spelt, 158,802; summer barley, 1,198,462; oats, 3,243,672; potatoes, 2,439,872; grass, clover and lucerne, 7,703,535; sugar-beet, 326,974.

TABLE VII.—*Cultivation (in 1,000 hectares).*

| Territories | Land under tillage and gardens | Meadow-land | Pasturage | Fruit Farms | Vine-yards | Forests and Woods | Houses and farmyards, waste land and shores, roads, waterways |
|---|---|---|---|---|---|---|---|
| Prussia | 14,440·1 | 2,844·8 | 1,689·4 | 14·7 | 20·2 | 7,461·7 | 3,194·8 |
| Bavaria* | 3,002·3 | 1,323·8 | 247·2 | 3·5 | 21·3 | 2,494·3 | 493·5 |

* Excluding Coburg. † Including Coburg.

Rye is cultivated principally in the N. and E., while the cultivation of wheat is more extensive in the W. and S.

During the war years agricultural production was greatly reduced, and even in 1920 it had not nearly regained the level of 1913. The cause was the dearth of labour, which was most acute on the large properties, and also, to a great extent, the lack of manures, especially artificial manures. The decrease in production was, on the whole, most marked where large properties predominated.

The average quantities (in tons) produced per hectare throughout the Reich were in 1920 as follows:—wheat 1·63 (average of 1909–13, 2·15); rye 1·15 (1·82); barley 1·50 (2·08); oats 1·50 (1·98); potatoes 11·48 (13·71); clover and lucerne 5·16 (4·71); grass 4·31 (4·28). The crops throughout the Reich amounted in 1920 (in tons) to:—wheat, 2,255,055; winter spelt, 178,864; rye, 4,971,800; summer barley, 1,799,743; oats, 4,870,126; potatoes, 28,248,765; sugar-beet, 7,964,084; clover and lucerne, 11,419,406; grass, 23,656,436.

The yield of grain and fodder is quite inadequate for the requirements of the population of the German Reich, and Germany is compelled to import the larger proportion of both from overseas. Even the sugar-beet crop of 1920 was insufficient for the requirements of the country, in contrast to the years before the war when Germany was able to export large quantities. During the years 1913 to 1920 the production of raw sugar was as follows (in 1,000 *doppelsentner*; a *doppelsentner* or double hundredweight being 220 lb. or 100 kgm.):—1913, 27,159; 1914, 25,101; 1915, 15,153; 1916, 15,579; 1917, 15,411; 1918, 13,277; 1919, 7,896; 1920, 10,633.

The cultivation of *hops* extended during the years before the outbreak of war over approximately 27,000 hectares. The greater part of this, 65 to 70%, was carried on in Bavaria, and 25 to 30% in Alsace-Lorraine and Württemberg. During the war, the cultivation of hops declined very considerably. In 1919 only 8,030 hectares were under cultivation, but in 1920 the area rose again to 11,595 hectares, the crop that year amounting to 60,253 *doppelsentners* (see above). Owing to the restrictions placed on brewing, the demand for hops during the war was, of course, small.

In 1914 the number of breweries within the area in which beer was dutiable (that is, exclusive of Bavaria, Württemberg and Baden) was 3,602, with an output of 34,213,000 hectolitres; and in 1918 there were 2,192, with an output of 10,422,000 hectolitres. From 1919 onwards the three territories already named were included in the area in which beer was subject to duty. Within this area there were, in 1913, 23,229 breweries with an annual output of some 70 million hectolitres of beer. In 1919 only 11,477 breweries were at work. In 1920 the output of beer amounted to 23·3 million hectolitres.

The output of spirits amounted, up to 1914, to about 3·5 million hectolitres annually. From 1914 to 1918 there was an average annual output of 2·3 million hectolitres; and in 1919–20 the output dropped to 0·6 million hectolitres. In 1913–4 there were 53,448 distilleries at work, and in 1918–9 only 30,577.

The area under tobacco cultivation was 14,162 hectares in 1913 with a crop of 258,339 *doppelsentners*. In 1920 (partly in consequence of the loss of territory through the Peace Treaty), the area was 12,927 hectares, the crop in 1919 having fallen off to 205,836 *doppelsentners*. Tobacco is mainly grown in the territories of Baden and Bavaria (1920, 7,238 hectares). The principal plantations in the E. are to be found in the provinces of Brandenburg, Pomerania and E. and W. Prussia.

In 1920 the area under vine-culture in Germany amounted to 72,661 hectares, as compared with 120,207 hectares in 1906, but this diminution includes the loss of the Alsace-Lorraine vineyards to Germany. The output of must had fluctuated enormously from year to year. In 1904 it amounted to 8,118,000 hectolitres, as compared with 693,000 hectolitres in 1910. In 1920 the output amounted to 2,440,000 hectolitres.

*Live Stock.*—On Dec. 1 1913 it was reckoned that there were, within the territory of the late empire, 21 million head of cattle, 5·5 million sheep, 25·7 million pigs and 3·5 million goats. During the war live stock was seriously affected by the curtailment of fodder supplies, and was greatly reduced both in numbers and in weight per head. According to the census of live stock in the reconstituted area of Germany in Dec. 1920, as compared with the same territory in 1913, the figures were: horses, 3,581,380 (3,821,000 in 1913); cattle, 16,789,844 (18,648,271); sheep 6,139,299 (4,991,959); pigs, 14,149,462 (22,775,120); goats, 4,451,463 (3,256,853); and poultry, 60,751,686. Thus the figures for 1920 had fallen far short of those for 1913; but they cannot be viewed in their true light unless account is taken of the comparative weights of animals slaughtered. These were as follows (in kgm.) for the year 1919–20, as compared with pre-war averages:—oxen, 155 (250); calves, 31 (40); sheep, 17 (22); pigs, 75 (85). These figures show that the reduction in weight of animals slaughtered was considerable under each heading.

The distribution of live stock throughout the different territories is very uneven. Prussia, in consequence of its great extent, has the largest number. Horse-breeding is particularly flourishing in E. Prussia (breeding farm at Trakehnen), Schleswig-Holstein, Mecklenburg, Oldenburg, Hanover, Saxony (breeding farm at Graditz), and in Württemberg and Bavaria. Bavaria is richest in cattle; in this territory the pastures on the mountains (Alpenweiden, Alpen) are particularly favourable to cattle-rearing. But cattle-rearing is also carried on throughout the meadowlands of the hills and valleys of Württemberg, Thuringia and Hesse. It also forms the principal means of livelihood in the marshy lands on the Baltic, in Schleswig-Holstein, Pomerania and Mecklenburg. Pig-breeding is most extensively practised in Central Germany, but it also flourishes in Saxony, Westphalia and on the Lower Rhine. Sheep-breeding, which had been steadily on the decrease before the war, developed enormously in the later years. It is especially active in the northern parts of Germany in the less fertile and productive districts and in those containing large private properties. The development of sheep-breeding has been due to the shortage of wool in Germany and also to the lack of agricultural labour. But in spite of this increase in sheep-breeding, the production of wool falls far short of Germany's requirements. Goats and rabbits are especially numerous in Saxony, where there was great shortage of feed during the war. Necessity forced the inhabitants of this territory to make up the deficiency in food supplies to some extent by keeping small stocks.

The comparatively small quantity of live stock in Germany is totally inadequate for the supply of the population with meat and milk. During the war the people suffered very greatly from this shortage. The only means of securing to every individual a small share of meat and milk was by rationing the supply.

*Fisheries.*—The inland waters of Germany are fairly well stocked with fish. The fisheries on Lake Constance yielded 297 tons of fish in 1920, as compared with 390 tons in 1913. The sea fisheries in 1920 provided a larger yield than in any year before the war, and it was anticipated that, within the next few years, it would have increased to such an extent that Germany would no longer require to import fish from other countries. In 1920, 196,487 tons were caught in the North Sea and the Baltic, as compared with 183,900 tons caught during the most favourable year before the war, 1913.

*Mineral Resources.*—Germany, before the war, was the richest country on the European continent in iron ore, potassium and coal. In the last full year before the war, 1913, the raw mineral output amounted to 323,672,400 tons, with a value of 2,674·6 million marks. Table VIII shows the details.

TABLE VIII.—*Mineral Products, 1913.*

| | Quantity in 1,000 tons | Value in 1,000 marks | Persons employed |
|---|---|---|---|
| Pit coal | 190,109·4 | 2,135,978 | 655,012 |
| Brown coal | 87,233·1 | 191,420 | 58,958 |
| Iron ore | 28,607·9 | 115,718 | 42,906 |
| Lead, silver and zinc ores | 2,884·8 | 50,295 | 22,282 |
| Arsenic ore | 25·8 | 292 | 132 |
| Copper ore | 947·8 | 32,028 | 13,292 |
| Sulphur ore | 268·6 | 2,173 | 821 |
| Wolfram ore | 15·8 | 181 | 146 |
| Tin, cobalt, nickel and bismuth ores | 34·3 | 568 | 589 |
| Mineral oil | 121·0 | 8,514 | 964 |
| Asphalt | 105·5 | 792 | 225 |
| Graphite | 12·1 | 266 | 323 |
| Salt | 13,306·3 | 135,825 | 39,969 |
| Total | 323,672·4 | 2,674,550 | 835,160 |

During the war the output of minerals increased very considerably. Pit coal, iron ore and asphalt were the only products showing a considerable decline, the output of iron ore and coal being lowest in 1915. By the Treaty of Versailles, the German Reich lost valuable mineral resources. The annexation by France of Alsace-Lorraine in particular deprived Germany of its most productive sources of iron ore. In 1913, 74% of the total output of iron ore in Germany came from Alsace-Lorraine. The German political revolution of Nov. 1918, moreover, seriously affected output, since the introduction of the 8-hour day and the 7-hour shift in mines resulted in a great falling-off of production. This was accentuated by the diminished efficiency of labour owing to malnutrition resulting from the blockade during the war. A further economic loss to Germany arose out of the decision of the Peace Treaty to deprive the country for 15 years of all products from the Saar district. Hence, the total output in 1919 amounted to no more than 228,844,190 tons with a value of 27,324 million paper marks; the number of persons employed being 870,142.

The chief metals produced mainly from ores in 1913 were: iron, 16,763,800 tons, valued at 1,087,923,000 marks; lead, 188,000 tons, valued at 77,692,000 marks; copper, 53,800 tons, valued at 67,579,000 marks; bronze and brass, 3,000 tons, valued at 3,888,000 marks; raw and refined zinc, 278,800 tons, valued at 184,403,000 marks; tin, 12,000 tons, valued at 48,353,000 marks; nickel, 5,200 tons, valued at 15,509,000 marks. The output of these metals has been greatly diminished in the reconstituted Germany of 1919–20. The output from the smelting furnaces alone had been reduced by 25% (as compared with 1913). In 1919 the production in Germany was as follows: iron, 5,791,400 tons; lead, 57,600 tons; copper, 28,300 tons; raw and refined zinc, 97,400 tons; tin, 100 tons; nickel, 800 tons.

*Coal and Lignite.*—The coal output of Germany attained great dimensions in the 20th century. In 1860 the pit-coal production amounted to 12·8 million tons and the brown-coal (lignite) production to 4·4 million tons; the output had increased in 1900 to 149·3

million tons of coal and 40·5 million tons of lignite, and in 1913 the output was 190·1 million tons of pit coal (valued at 2,136,000,000 marks) and 67·6 million tons of brown coal (valued at 191,900,000 marks). Owing to loss of territory, the introduction of the 8-hour day and the reduced working capacity of the miners, only 140,757,000 tons of pit coal were produced in 1920, in spite of the fact that the number of workers in every coal-mining district had increased considerably. (The number increased in the Ruhr district, for instance, from 390,647 at the close of 1913 to 542,598 in May 1921; in Upper Silesia from 123,349 at the close of 1913 to 189,300 in Jan. 1921.) The output of brown coal (lignite), on the other hand (*see* FUEL), was increased, amounting in 1920 to 11,634,000 tons.

The most important mining districts for pit coal were the Ruhr district (114,487,000 tons in 1913; 84,986,000 tons in 1920) and Upper Silesia (43,435,000 tons in 1913; 31,686,000 tons in 1920). The next in importance was the Saar district (13,217,000 tons in 1913; 9,410,000 in 1920), of whose output, however, Germany was deprived under the Peace Treaty.

Coal is also produced, although in much smaller quantities, in Saxony, Lower Silesia, in the neighbourhood of Aix-la-Chapelle, and in the Wealden district near Hanover.

The most important brown-coal (lignite) mining districts are situated to the right and left of the Elbe, namely, the Thuringia-Saxony district, the districts of Lower and Upper Lausitz and the Brunswick-Magdeburg district. The brown-coal mining district on the Lower Rhine, near Cologne, is also very extensive. Small deposits are also to be found in Westerwald, Upper and Lower Hesse, and in Upper Bavaria. More than one-third of the total output is obtained from the Thuringia-Saxony district.

The development of the coke and briquette production corresponds to that of the coal output; of recent years coke production has declined, but the production of brown-coal briquettes has considerably increased, as shown more particularly in the year 1920. In 1913, 34,630,000 tons of coke and 21,977,000 tons of brown-coal briquettes were produced; in 1920 the production was 25,177,000 tons of coke and 24,282,000 tons of brown-coal briquettes.

*Graphite* is only obtained in Lower Bavaria. In 1919 the output amounted to 30,525 tons, representing a value of 5,480,942 marks.

*Asphalt* quarries are found in Prussia in the province of Hanover, and in Brunswick. The output in 1919 amounted to 12,554 tons with a value of 273,395 marks.

*Petroleum.*—The principal mineral-oil fields of Germany are in the Hanoverian lowlands between the Weser mountains and the Teutoburg forest. The large oil-field in Lower Alsace passed, with the cession of Alsace and Lorraine, into French possession. The production of mineral oil in 1913 amounted to 121,000 tons, with a value of 8·5 million marks; in 1919 it was 37,442 tons.

*Iron Ore.*—The presence of large quantities of iron ore in Germany was the main cause of the steady expansion of the heavy goods industry and a fruitful source of the increasing wealth of the country. Within the German customs area (including the Grand Duchy of Luxemburg) the output in 1910 was 28,710,000 tons, valued at 106,800,000 marks; and in 1913, excluding Luxemburg, it amounted to 28,607,900 tons, falling, however, in 1915 to 17,709,600 tons. In 1919 the output was further diminished to 6,156,049 tons with a value of 218,327,000 paper marks. By far the greater proportion of the total ore output, about 75%, used to consist of minette, and by the cession of the minette districts of Alsace-Lorraine Germany lost the whole of her minette production. The most productive ore districts still remaining in the possession of the German Republic are in the Siegerland-Wieda sparry iron ore district, the district of Peine and Salzgitter, the Nassau-Upper Hessian district and the Vogelsberg district.

Before the war Germany ranked second to the United States in the iron production of the world. In 1910, the production was 14,794,000 tons. In 1913 the output of pig iron in Germany, exclusive of Luxemburg, amounted to 16,763,809 tons; owing to the war it fell in 1915 to 10,154,700 and in 1919 to 5,791,433 tons.

*Lead and Zinc.*—The principal lead and zinc mines are situated in Upper Silesia and near Aix-la-Chapelle. Smaller deposits are worked in the Upper Harz, within the Hildesheim administrative area, in the Erz mountains near Freiberg and in the Black Forest. The output for several years before the war was maintained at practically the same level. In 1913 it amounted to 2,884,758 tons. From that time up to 1915 there was a sharp decline; in 1918, however, the output again reached 2,812,700 tons. In 1919 the output in Upper Silesia and the Rhineland fell to 1,703,413 tons.

In 1913 the production of lead amounted to 205,400 tons and that of zinc to 278,800; in 1919 it fell to 57,580 tons and 97,397 tons, respectively. The principal lead-smelting works are in Saxony, in the Harz and within the areas of Aix-la-Chapelle and Cologne; the largest number of zinc-smelting works are in Upper Silesia, where the output of zinc in 1913 amounted to 60% of the German output.

*Copper.*—In 1913 the output of copper ore amounted to 947,757 tons and 53,832 tons of copper was produced. The ore was chiefly obtained from the Harz, and from the districts of Mansfeld, Lower Silesia and Saxony. Smaller quantities were obtained from the Rhine district and in the neighbourhood of Stadtberg. In 1919 616,869 tons of copper ore were obtained and 38,370 tons of copper manufactured, but mostly not from ore.

Of *tin* the output in 1913 was 12,048 tons. The output in 1919 amounted to 83 tons.

*Salt.*—The territories of Saxony and Anhalt are the richest in salt; here are the great rock-salt pits of Stassfurt and Leopoldshall. In 1913 there were 153 salt mines under exploitation, besides 72 salt pits. The principal salt pits are in the Saxony-Thuringia district. Out of a total output of 13,306,300 tons in 1913, rock-salt represented 1,349,581 tons and potassic crude salt 11,956,528 tons. According to statements of the *Kalisyndikat* (Potash Syndicate), 7·8 million tons of potassic salt were produced in 1919, and 11·4 million tons in 1920. The total output for 1913 was valued at 135·8 million marks. In the salt works 675,903 tons of refined salt and 8,986 tons of other salts were produced; in 1919 the total production was 296,854 tons.

*Industry.*—Thanks to the great mineral resources of the country, to the energy of the people, and to the organized application of science to industry, Germany had been able to extend her industrial activities enormously in the generation before the war.

Table IX gives the statistics for industrial occupations and the persons employed in them, according to the census of industry in 1907, adjusted to the population represented in the restricted territory of 1919–20.

TABLE IX.—*Industrial Occupations.*

| Industrial Groups | No. of principal works | No. of secondary works | No. of persons employed | No. of labourers among these |
|---|---|---|---|---|
| Landscape and market gardening | 32,325 | 1,802 | 113,166 | 65,248 |
| Live-stock rearing and fisheries | 15,359 | 7,650 | 29,424 | 10,843 |
| Mining and smelting | 4,989 | 747 | 813,956 | 772,776 |
| Stones and earth | 44,532 | 4,476 | 721,280 | 649,652 |
| Metal manufactures | 141,776 | 12,886 | 900,432 | 707,758 |
| Machines and instruments | 87,777 | 12,971 | 1,072,317 | 870,595 |
| Chemical industry | 9,926 | 547 | 165,604 | 128,868 |
| Illuminants, soaps, etc. | 5,745 | 982 | 88,415 | 67,352 |
| Textiles | 129,619 | 22,948 | 1,005,450 | 785,982 |
| Paper | 19,182 | 1,376 | 223,702 | 186,779 |
| Leather | 47,028 | 3,965 | 198,571 | 136,462 |
| Timber and carving-materials | 189,611 | 32,108 | 719,222 | 492,310 |
| Foodstuffs and luxuries | 288,768 | 47,801 | 1,160,506 | 715,471 |
| Clothing | 640,459 | 45,718 | 1,230,046 | 506,409 |
| Cleaning | 117,382 | 11,574 | 239,991 | 108,554 |
| Building | 194,574 | 22,405 | 1,454,919 | 1,183,293 |
| Photography | 18,008 | 1,199 | 201,384 | 161,951 |
| Industrial art | 11,776 | 585 | 29,143 | 15,499 |
| Commerce | 789,227 | 230,531 | 1,944,189 | 680,428 |
| Insurance | 22,847 | 34,037 | 66,447 | 4,530 |
| Traffic and transport | 83,044 | 23,466 | 387,108 | 263,448 |
| Hotel-keeping and liquor trade | 303,033 | 41,215 | 749,240 | 269,971 |
| Music, theatres, exhibitions | 23,742 | 9,426 | 83,866 | 19,223 |

The census of 1907 showed that the number of persons industrially employed had constantly increased, since the corresponding census in 1882 and 1895, in a higher ratio than the number of industrial concerns, so that the size of these concerns had increased from one census to the other. In 1882 the average number of persons engaged in the principal works was estimated at 2·5, 1895 at 3·2 and in 1907 at 4·2. The number of industrially employed persons increased also more rapidly in proportion than the total population. While the pop. as a whole increased by 14·5% between 1882 and 1907, the industrial pop. increased within the same period by 39·9%. A steadily augmenting proportion of the German pop. had thus found employment in industrial work. From 1895 to 1907 the industries connected with foodstuffs and luxuries and with machinery, instruments and apparatus, showed the greatest development of all in this respect. The increase in the number of persons employed in these industries and in the building trade amounted to over half a million in each branch. In the machinery, instrument and apparatus-making industry, the increase amounted to 92·3%, and in the building trade to 49·6%. The number of textile works decreased by 87,399, or 33·2%, but the number of persons employed in them increased by 95,023, or 9·6%. While a marked decrease took place in the number of works engaged in the metal manufactures, wooden and carved goods and in the clothing industry, the number of persons employed in these branches of industry increased as follows: in the metal industry by 46·5%, in the timber and carved goods industry by 28·6% and in the clothing industry by 6·5%. In 1907 the building trade employed the greatest number of persons; next came the clothing industry, the foodstuffs and luxuries industries, the manufacture of machinery, instruments and apparatus and the textile industry. As a result of the war this grouping underwent a considerable alteration. In 1921 conditions were such that the building

trade had undoubtedly forfeited its leading position. The mining and smelting industry probably assumed that place; this industry employed only 813,956 persons in 1907, but must certainly have given occupation to considerably more than a million persons at the end of 1921. Similarly, the extent of the textile industry greatly diminished. During the war and afterwards this industry suffered particularly severely from the lack of raw materials, so that many factories were forced to close down. This shortage had not yet been made good in 1921. The clothing industry had also certainly suffered. On the other hand, the number of persons employed in the metal and chemical industries, in the production of wooden and carved goods, and in the paper industry, was proportionately far greater in 1921 than in 1907. It was impossible, however, in 1921 to obtain definite statistics. There had been no new industrial census, and the various branches of industry were in such a state of flux that it might happen that an industry was at an absolute standstill one day, so that persons engaged in it were forced to enter another, while the next day this same industry had become a refuge for large numbers of unemployed.

An approximate idea, however, of the decline in production may be derived from the exports of Germany in 1920, as compared with those of 1913, in different categories of products of the iron industry (Table X).

TABLE X.—*Exports of Iron Goods.*

| Class of goods | Export 1913 (in cwt.) | Export 1920 (in cwt.) | Decrease (−)or Increase(+) per cent |
|---|---|---|---|
| Ornamental castings and other fine castings, non-malleable, fireplaces, ovens, etc. | 811,409 | 675,004 | −16·8 |
| Parts of machines of non-malleable cast iron. Parts of engines, ships, etc. | 578,873 | 71,195 | −87·7 |
| Tin—raw, annealed, worked, dressed, polished, cut, etc. | 6,651,324 | 2,478,807 | −62·7 |
| Wire—rolled or drawn in the rough or finished product | 4,626,586 | 839,079 | −81·9 |
| Tramway and railway rails, railway sleepers, fishplates, chairs, plate screws, etc. | 6,574,144 | 1,520,159 | −76·9 |
| Railway axles, wheels, spokes, mountings of railway carriages, etc. | 1,255,342 | 368,796 | −70·6 |
| Bridges and component parts of bridges. Iron building materials of wrought iron | 1,098,710 | 435,886 | −60·3 |
| Locomotive and traction engine boilers and funnels of worked iron, combined parts of the same, etc. | 288,658 | 308,340 | + 6·8 |
| Ploughs (excluding traction power ploughs), ploughshares, harrows, etc. | 375,515 | 163,918 | −56·3 |
| Heavy forks for hay, dung, turnips, coke, stones, etc. | 24,430 | 13,335 | −45·4 |
| Scythes, sickles, knives, strawcutters, picks | 38,312 | 27,806 | −27·4 |
| Pieces for cross-saws, handsaws | 40,264 | 32,727 | −18·7 |
| Files, rasps | 27,672 | 18,611 | −32·7 |
| All classes of rough cutlery with the exception of rough knives and shears | 58,295 | 53,446 | − 8·3 |
| Scales (for weighing) except automatic scales and scales of precision, flat-irons, etc. | 68,377 | 105,298 | +54·0 |
| Wire ropes and cords, barbed wire, plaited wire, wire netting, wire clamps, etc. | 468,231 | 226,858 | −51·5 |
| Pins, cut nails (tacks, brads, drawing pins) | 661,466 | 305,802 | −53·8 |
| House and kitchen equipment. Cooking-utensils made of sheet iron and several parts of these | 320,891 | 207,590 | −35·3 |
| Building, furnishing appurtenances, doors, furniture (chains, and similar component parts of furniture, doors, ventilators, etc.) | 226,020 | 147,418 | −34·8 |

In contradistinction to the iron industry, the German textile industry rests only partially on indigenous production. Germany's dependence in her textile industries on foreign markets for raw materials became very apparent during the World War, when resort had to be made to substitutes to a large extent. The manufacture of cloths made of nettles, and particularly of paper, was developed. The former was, however, very expensive, and the latter produced warps which, though fairly durable, were on the whole very uncomfortable to wear. Both branches greatly diminished in importance when the import of raw materials once more became possible. How severely the cotton industry was still suffering in 1920 is best shown by the fact that the total imports of raw cotton in the first 10 months of 1920 amounted to only 1,070,543 double-cwt. compared with 4,223,071 during the same period in 1913. To meet this deficiency, 92,487 double-cwt. of prepared, bleached, dyed, printed and woven calico and embroideries had to be imported as against an export of 272,279 double cwt. in the same period of the year 1913.

The German chemical industry increased enormously during the war years. Germany's severance from the world's markets (especially from the supply of nitrate) compelled her to provide her own materials. Enormous works sprang up in Upper Silesia and particularly in Thuringia for the artificial production of nitrogen.

Before the war, Germany possessed almost a world monopoly in the production of aniline dyes. In 1907 24 establishments employing 9,071 people were engaged in this industry. In 1920, however, the export of dyes and dyestuffs was only 40 % of the pre-war amounts.

*Labour Market, Wages, Prices.*—German production had received a tremendous blow through the war and the political revolution of Nov. 1918. In a still higher degree than for the output of raw materials does this hold good for the manufacture of finished articles. The diminution there was due not merely to the cessions of territory, the introduction of the 8-hour day and the diminished working capacity of labour, but also to the increased difficulty of obtaining raw materials and of finding markets. The result of these conditions in the first years after the Armistice was a vast amount of unemployment. The statistics compiled with regard to unemployment and applications for work give only an incomplete picture of the situation. The greater part of the unemployment was not total but partial. The number of workers affected by short-time represents many times the number of the totally unemployed. According to the demobilization commissioner's figures, on Jan. 15 1920 there were 454,775 heads of households in receipt of relief, and 379,071 receiving supplementary grants; and on June 1 1921 the corresponding figures were 357,850 and 384,003. At the different trade unions 26,144 persons reported themselves at the end of Nov. 1918 as out of work; at the beginning of 1920, 129,972; and at the beginning of 1921, 225,581. At the end of Nov. 1918, 264 applications were made at the labour exchanges for every 100 vacant situations for male workers; in May 1921 the figure was still high, 204. To relieve the distress of the unemployed masses the system of doles was introduced by ordinance in Nov. 1918.

The difficulties of the labour situation were only affected in a comparatively small measure by the question of wages. It is true that the political revolution of Nov. 1918 was accompanied by a demand for higher wages; but the rise was only rarely out of proportion to the increase in the cost of living. What was specially notable in the wage movement was the approximation to a uniform level in the cost of the wages of workers who were formerly paid on different scales. This levelling arose from the fact that the wages of the lowest-paid classes rose comparatively far higher than those of the classes which were formerly highly paid. For instance, in the mining industry of the Ruhr the wages of the actual miners (who were occupied below ground) did not rise quite 900 %, while the wages of young male workers rose by almost 1,500 %. A similar development took place in all occupations and in all social strata. Among commercial salaried employees, for instance, between 1913 and 1921, salaries rose 500 % for men over the age of 30; for men under 20 they rose by 790 %; for females over 30 years of age salaries rose by 830 %, and for females under 20 by 970 %.

Generally speaking, however, it may be said that, in the summer of 1921, except in a very few strata at each end of the social scale, the standard of living was very much below that of 1913.

The rise in wages was largely governed by the cost of living. If the average cost of normal rations for a family of five persons in 1913 be represented by 100, the following index figures emerge for 1920 and 1921:—

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Feb. | 1920 | . . . | 635 | Dec. | 1920 | . . . | 934 |
| March | 1920 | . . . | 747 | Jan. | 1921 | . . . | 944 |
| April | 1920 | . . . | 648 | Feb. | 1921 | . . . | 991 |
| May | 1920 | . . . | 868 | March | 1921 | . . . | 901 |
| June | 1920 | . . . | 845 | April | 1921 | . . . | 894 |
| July | 1920 | . . . | 856 | May | 1921 | . . . | 880 |
| Aug. | 1920 | . . . | 790 | June | 1921 | . . . | 896 |
| Sept. | 1920 | . . . | 779 | July | 1921 | . . . | 963 |
| Oct. | 1920 | . . . | 843 | Aug. | 1921 | . . . | 1,045 |
| Nov. | 1920 | . . . | 882 | | | | |

In connexion with these figures it must be borne in mind that the prices of certain classes of goods, on which the index figures are based, were kept down by means of considerable subsidies from the Reich. For what are called "free goods," *i.e.* uncontrolled commodities, the rise in prices was much greater and more sudden. This may partly be observed in the index of wholesale prices which the Statistical Office of the Reich issued subsequently to Jan. 1921. The index figures for the prices of these articles were as follows (100 being taken to represent the index figure of 1913):—

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Jan. | 1920 | . . . | 1,243 | March | 1920 | . . . | 1,604 |
| Feb. | 1920 | . . . | 1,670 | April | 1920 | . . . | 1,856 |

| | | | |
|---|---|---|---|
| May 1920 | 1,502 | Jan. 1921 | 1,436 |
| June 1920 | 1,377 | Feb. 1921 | 1,372 |
| July 1920 | 1,363 | March 1921 | 1,334 |
| Aug. 1920 | 1,446 | April 1921 | 1,323 |
| Sept. 1920 | 1,495 | May 1921 | 1,306 |
| Oct. 1920 | 1,462 | June 1921 | 1,365 |
| Nov. 1920 | 1,506 | July 1921 | 1,425 |
| Dec. 1920 | 1,437 | | |

This index, however, is also influenced by statutory prices. In free commerce prices rose in some instances fifty- and sixty-fold. The situation, of course, was always subject to the course of depreciation in the value of the mark, German prices tending to rise as the value of the mark abroad fell and vice versa.

*Commerce.*—In 1902 an entirely new tariff law was adopted and came into force in 1906, when certain commercial treaties expired. By the Treaty of Versailles, however, some of the fundamental principles of the German customs tariff system were interfered with. Goods from regions formerly German are now duty-free or enjoy preferential treatment. Germany's freedom to conclude commercial treaties is restricted by the provision that most favoured treatment granted to any country by Germany is automatically extended to the Allied and Associated Powers. As a general rule, however, the German arrangements which were in force before the World War remained valid.

In accordance with the industrial development of Germany and the necessity of exporting on a large scale, and thanks to the diligent activities of German merchants and engineers, German foreign trade underwent an immense expansion up to the year 1914. In "special trade," inclusive of bullion, German imports had risen (in millions of marks) from 9,130 in 1910 to 11,206 in 1913, and exports from 7,644 to 10,198. But on the outbreak of the World War German foreign trade collapsed. The complete severance from the world market caused by the blockade confined Germany to an extremely limited coastal trade with the northern neutral countries. For 1919 the imports were valued officially at 32,376 million marks, and the exports at 10,057 millions; but these amounts cannot be compared with the statistics for former years, since the values they give are in depreciated paper marks. Only by reducing paper marks to gold marks can comparable amounts be obtained. This applies in a still greater measure to the values given for the year 1920. The exports for the year 1920 figured out at about 69·3 milliards of paper marks. No figures were issued for imports. To form an idea of the extent of Germany's foreign trade in 1920 as compared with that before the war a closer examination must be made of the different kinds of goods and the quantities imported and exported.

*Imports.*—Germany, a country with a population much too large in proportion to its agricultural production, and with industries also too extensive by comparison with its natural resources, has, as a natural consequence of this situation, an import trade which consists principally of food-stuffs, raw materials and half-manufactured goods. In 1913, of the total value of the imports 45·2% was raw materials, 10·7% half-manufactured goods, and 26·3% food-stuffs and luxuries. The total value of the above amounted to 9,572·3 million marks. The import of finished goods was only 10·7% of the total imports and amounted in value to 1,246·1 million marks. In 1920 there had been no fundamental change in the relative proportions of these imports. The figures for food-stuffs are somewhat more prominent, while for finished goods they are rather less. Table XI shows the imports and exports of the principal food-stuffs for 1913 and 1920 respectively.

TABLE XI.—*Imports and Exports of Food (in double-cwt.).*

| | 1913 | | 1920 (Jan.–Oct.) | |
|---|---|---|---|---|
| | Import | Export | Import | Export |
| Wheat | 25,459,586 | 5,383,130 | 5,914,801 | 21,037 |
| Rye | 3,525,339 | 9,344,634 | 4,041,258 | 12,848 |
| Rye and wheatmeal | 188,687 | 4,198,571 | 781,013 | 282,852 |
| Potatoes | 3,820,496 | 3,324,725 | 7,308,092 | 573,961 |
| Fresh vegetables | 3,089,812 | 532,104 | 1,985,014 | 310,273 |
| Fruit and tropical fruits | 19,025,799 | 303,327 | 2,022,319 | 52,185 |
| Wine | 1,303,367 | 208,342 | 865,493 | — |
| Canned delicacies | 71,556 | 81,779 | 1,207,446 | 21,371 |
| Rice | 4,775,998 | 1,843,536 | 1,270,256 | 10,010 |
| Beans, peas, lentils | 2,119,870 | 120,295 | 1,765,431 | 46,376 |
| Barley and oats | 37,432,455 | 6,677,568 | 774,486 | 51,018 |
| Maize | 9,186,553 | 346 | 4,089,317 | 11 |
| Beef, veal, pork, mutton, goats' flesh | 549,325 | 16,605 | 1,390,352 | 1,017 |
| Bacon | 16,498 | 366 | 816,508 | 54 |
| Lard | 1,073,869 | 169 | 1,234,132 | — |
| Milk | 771,982 | 167,733 | 292,114 | 14,504 |
| Butter | 542,394 | 2,732 | 78,141 | 1,946 |
| Cheese | 262,646 | 7,270 | 228,357 | 784 |
| Oil and vegetable fats | 483,918 | 242,575 | 852,326 | 10,641·35 |
| Margarine and artificial fats | 989 | 533,013 | 640,670 | 12,370 |
| Sugar | 27,670 | 11,262,170 | 982,948 | 68,259 |
| Fish, fresh, | 1,685,057 | 170,258 | | |
| smoked, salted (bac.) | 1,298,119 | 5,521 | 4,836,728 | 23,358 |
| Tobacco | 813,998 | 4,339 | 834,566 | 3,342 |

It is noteworthy that the import of grain (flour being reckoned in the corresponding quantities of grain) in 1920 almost exactly corresponded to the quantity required in 1913, taking into account the diminution of territory in 1920; and further that the import of potatoes, pulse, sugar, meat and fats had risen enormously.

Table XII shows the imports and exports of raw materials.

TABLE XII.—*Imports and Exports of Raw Materials (in double-cwt.).*

| | 1913 | | 1920 | |
|---|---|---|---|---|
| | Import | Export | Import | Export |
| Mineral oils | 12,943,547 | 334,604 | 4,201,901 | 73,279 |
| Iron manganese | 160,151,493 | 27,772,847 | 64,504,207 | 1,605,200 |
| Copper ore | 275,950 | 252,211 | 1,083,114 | 29,038 |
| Pyrites and pyritic ores | 10,257,321 | 282,141 | 4,785,097 | 26,641 |
| Raw iron | 1,243,161 | 7,829,108 | 979,994 | 1,259,216 |
| Copper | 2,253,920 | 72,037 | 595,217 | 63,455 |
| Aluminium | 153,225 | 27,032 | 78,221 | 28,639 |
| Lead | 837,810 | 413,694 | 173,066 | 87,577 |
| Tin | 142,606 | 64,374 | 45,362 | 2,261 |
| Zinc | 559,642 | 1,052,435 | 5,268 | 278,776 |
| Cotton | 5,211,280 | 525,834 | 1,498,793 | 6,753 |
| Flax | 932,223 | 432,069 | 17,435 | 3,827 |
| Hemp | 616,966 | 89,434 | 161,775 | 380 |
| Jute | 1,620,634 | 78,216 | 505,217 | 8,603 |
| Wool | 1,992,713 | 168,641 | 524,890 | 5,518 |
| Silk | 43,039 | 7,730 | 12,187 | 1,997 |
| Hides | 2,765,744 | 824,724 | 601,819 | 19,081 |
| Rubber | 237,806 | 46,012 | 127,910 | 1,289 |
| China clay | 3,031,063 | 420,576 | 1,311,016 | 312,125 |
| Rough wood | 12,848,734 | 668,801 | 648,764 | 367,982 |
| Coal | 105,400,694 | 345,984,084 | 2,629,370 | 73,049,823 |
| Lignite | 69,870,647 | 603,451 | 23,406,957 | 722,993 |

In the import of raw materials a great diminution is apparent in the figures for 1920.

*Exports.*—The fact that the expansion of Germany's exports before the war was due, not to the possession of raw materials so much as to industrial enterprise and labour, is of decisive importance in estimating the effects of her defeat and of the Peace of Versailles. If the 132 milliards of gold marks which were demanded from Germany by way of reparations were to be paid, this could only be done by increased achievements on the part of German labour in the creation of goods for export. Among German exports in 1913 the value of metal goods (machinery, etc.) stood first, at more than 3 milliard marks, or, roughly, three-tenths of the total. In 1920 they represented three-eighths. The imports in this class in 1913 amounted only to 830 million marks, leaving a large credit balance. The next highest group of exports in point of value is that of the products of agriculture and forestry, and other animal and vegetable products, food-stuffs, etc., to the total of 1,728·2 million marks. It is counterbalanced, however, by imports of the same categories to the value of 7 milliards of gold marks. Only the products known as those of the "secondary agricultural industries" show a balance in favour of exports, particularly flour of all kinds, pearl barley, corn flour, groundnut oil, palm-kernel oil, coconut oil, potato starch, stiff rubber, beet-root sugar, beer and mineral waters. In the third highest group of exports, that of manufactured animal and vegetable fibres and goods made of these, to the total value of 1,560·6 million marks in 1913, there was a considerable excess of exports over imports, more than 700 million marks in all. In these exports woollen and cotton goods took the first place. The export of woollen and cotton goods alone amounted to almost one milliard marks in value. The situation was equally favourable in other groups: chemical and pharmaceutical products; dyes and dyeing materials; leather and leather goods; furriers' goods; catgut goods; paper and pasteboard, and goods made therefrom; rubber goods, etc. It is only in the large group of mineral raw materials and mineral oils that an export of 869·8 million marks in 1913 was set off by a larger amount of imports, 1,087·3 million marks.

In 1920 the proportions of the different groups had considerably altered. The second place was no longer occupied by the products of agriculture and forestry, but by chemical products, dyes and dye-stuffs. These are followed by textiles and mineral raw materials. Next come agricultural and forestry products, and the other groups. The exports of the most important goods in 1913 and 1920 (Jan.–Oct.) are compared in Table XIII.

Before the war, the share of the different countries in Germany's foreign trade was proportionate to their supplies of goods and raw material and to their demand for finished goods. Russia took the first place for imports into Germany from European countries. German exports to Russia were correspondingly large. Great Britain, Austria and France were the next most important sources of imports. Then a long way after came Belgium, Holland and Italy; and at the bottom of the list Sweden, Switzerland, Spain and

Denmark. Among non-European countries as sources of imports the United States was the chief factor, with British India, the Dutch Indies, Australia, Brazil and Chile well represented.

TABLE XIII.—*Principal Exports (in 1,000 double-cwt.).*

| | 1913 | 1920 |
|---|---|---|
| Sugar-beet seeds | 296·5 | 159·5 |
| Hops | 64·9 | 98·1 |
| Products of forestry | 7,885·2 | 10,188·7 |
| Wood for building | 3,938·4 | 6,521·7 |
| Earths and stones | 41,784·8 | 27,730·2 |
| Coal and anthracite | 345,984·1 | 73,049·8 |
| Coke | 64,329·9 | 9,814·0 |
| Chemical products | 49,032·6 | 26,324·6 |
| Salt, brine, etc. | 4,321·1 | 12,533·2 |
| Rough salt | 11,248·1 | 3,291·7 |
| Mineral manure (potash, etc.) | 4,608·7 | 4,952·3 |
| Sulphuric magnesia, chloride of potassium | 5,859·4 | 1,583·7 |
| Dyes and dyestuffs | 2,620·0 | 1,015·4 |
| Aniline dyes, etc. | 642·9 | 142·1 |
| Alizarin, etc. | 110·4 | 33·3 |
| Indigo, etc. | 336·1 | 66·7 |
| Fibrous textiles | 4,264·3 | 782·7 |
| Silk | 137·1 | 33·7 |
| Wool | 755·2 | 121·7 |
| Cotton | 1,330·4 | 143·5 |
| Leather | 251·6 | 43·2 |
| Leather goods | 115·2 | 31·8 |
| Furriers' goods | 34·5 | 10·3 |
| Rubber goods | 197·1 | 31·1 |
| Wooden goods | 790·9 | 1,050·3 |
| Paper and paper goods | 5,426·1 | 262·8 |
| Books, pictures and paintings | 243·0 | 118·7 |
| Stone and mineral goods | 1,881·0 | 3,184·1 |
| Pottery | 7,787·5 | 3,843·8 |
| Glass and glass goods | 2,458·1 | 1,184·3 |
| Base metals and goods therefrom | 68,519·4 | 18,478·8 |
| Iron and iron alloys | 65,024·9 | 17,506·0 |
| Aluminium and aluminium alloys | 83·7 | 84·1 |
| Machinery | 5,956·7 | 3,976·7 |
| Electrotechnical goods | 1,338·5 | 671·4 |
| Vehicles | 1,089·9 | 2,078·0 |
| Watches | 85·7 | 60·1 |
| Musical instruments | 285·9 | 463·0 |

In 1920 there were no imports from Russia. The European States which had been belligerents were sending very little; and the largest importing countries were the United States, Argentina, and the European neutrals. In the import of iron ore, Lorraine and Luxemburg began to play a considerable part.

As regards German exports, on an average for the years 1910–3, Great Britain took 14% of the total, Austria 11·2%, Russia 7·9%, United States 7·7%, Holland 6·7%, Switzerland 5·8%, Belgium 5·3%, Italy 4·2%, Argentina 2·9%, Denmark 2·8%, Sweden 2·3%, Brazil 1·9%, and Norway 1·6%. According to a calculation for the first eight months of 1920, the proportionate shares of the different countries in Germany's total export trade that year were as follows:—Holland 21·2%, Switzerland 9·2%, Sweden 7·1%, Norway 3·0%, Denmark 6·1%, Finland 1·7%, Spain 2·7%, Austria, Hungary and the "succession states" 7·8%, Balkans and Turkey 1·1%, Russia and Poland 2·5%, Great Britain 6·4%, France 3·0%, Belgium 3·0%, other European States 5·1%, America 7·2%, and other non-European countries 10·0%. It will be observed that the United States, and in a less degree Italy, maintained somewhat similar places in the proportion taken of German exports in 1920, to those occupied in 1913. More than half the total export (51%) went to European countries that had been neutral in the war. If the larger European States are regarded under three groups (Neutral States, Entente States, Eastern and South-eastern Europe), the distribution of German exports in the first eight months of 1913 and 1920 respectively (Jan.–Aug.) will be seen in Table XIV in millions of marks, (*i.e.* gold marks in 1913, and only depreciated paper marks in 1920).

TABLE XIV.—*German Exports to Europe.*

| | German exports | | Percentage of total German exports | |
|---|---|---|---|---|
| | 1920 | 1913 | 1920 | 1913 |
| Holland, Scandinavia, Switzerland and Spain | 20,714 | 1,430 | 50·9% | 21·2% |
| Great Britain, France, Belgium and Italy | 6,291 | 2,115 | 15·4% | 31·4% |
| Russia, Austria-Hungary, Balkans and Turkey | 4,615 | 1,532 | 11·3% | 22·8% |

*Railways.*—In 1913 the full-gauge German railway lines had attained an extent of 57,481 kilometres. The lines were the property of the several states. On April 1 1920, in accordance with the inter-state convention of April 30 1920, the German State railways were transferred to the Reich. By the cession of territory under the Treaty of Versailles about 7,000 km. of the former German railway system passed to other countries, 1,436 km. of the railways of the Saar coming under French administration. At the end of 1921 the total length of the German railways may be reckoned at 53,797 kilometres. The amount of rolling stock (without that of Alsace and Lorraine) was as follows:—locomotives (1913) 28,111, (1920) 30,000; passenger carriages and luggage vans (1913) 79,084, (1920) 60,000; goods wagons (1913) 631,323, (1920) 546,800. Before the war, the railways were a considerable source of income for the states. In 1918 there was for the first time a deficit, which increased in 1919, and in the financial year 1920 amounted to 16·4 milliard paper marks. The cause of this deficit lay first and foremost in the increased cost of working materials, partly also in the increased wages and numbers of the railway officials, and also in the impossibility of raising the rates for passenger and goods traffic in proportion. A large increase of rates, intended to lower the total deficit, came into force on June 1 1921. For 1920 the total receipts were 14·9 milliard (paper) marks and the expenses 31·3 milliards. The railway staff numbered 740,505 in 1913 and 1,044,379 in 1920.

*Postal Service.*—Before the war years, the imperial postal administration did not include the states of Bavaria and Württemberg, which had their own separate services. It was only in 1919, with the foundation of the German Republic, that the postal system as a whole became an affair of the Reich. The German Post Office staff (for the whole area of the Reich) numbered 334,064 in 1913 and 476,563 at the end of 1920.

International telegraphic communication by means of deep-sea cables does not belong to the postal system properly so called. At the beginning of the war, in 1914, Germany possessed 112 deep-sea cables with a length of 43,500 km., of which 5,474 km. were the property of the State. By the Peace Treaty of Versailles, Germany was deprived of all her cables, except about 6,500 km., which consisted for the most part of the end sections of the former great cable lines. As Germany's means of communication with the world was thus severed, her wireless system became of most vital importance to her. By means of her wireless stations Germany can now communicate with the whole world. The largest is at Nauen.

*Shipping.*—The German mercantile marine grew from 4,658 vessels of 4,430,227 tons in 1910 to 4,935 vessels of 5,238,987 tons in 1914. Of the 4,935 ships (including a tonnage of 4,694,190 steam ships), 3,968 were merchant vessels proper and 621 fishing vessels. The personnel of the German merchant service amounted to 83,898 officers and seamen. The demand for ships was supplied almost entirely from the German shipyards. In 1913 there was launched from the German yards a total registered tonnage of 465,000. The war made a sharp break in this development. On the one hand, there was no need for new shipping, as Germany's foreign trade was interrupted by the blockade; on the other hand, the shipyards had for the most part to be transformed for war purposes. Launches of new ships dropped to 199,000 tons in 1915, 38,000 tons in 1917, and 16,000 tons in 1918. In 1919 shipbuilding was practically at a standstill, only 12,000 tons being launched. The Peace Treaty of Versailles, with its stipulations as to the surrender of German tonnage, dealt German shipping a deadly blow. Of the more than 5,000,000 registered tons in 1914, in the middle of 1920 there only remained to Germany 419,000 registered tons, the rest having all had to be handed over. Germany was also bound by the Treaty to build each year 200,000 registered tons for the Entente.

Only a short time before the outbreak of war the great plans embodied in the Prussian Waterways Law of April 1 1905 had been realized—the Berlin–Stettin ship canal, the Rhine–Hanover canal, the enlargement of the Bromberg canal, etc.

The central idea of future German policy as regards the waterways lay in 1921 in establishing connexions between the different natural river channels, the courses of which, with the exception of that of the Danube, generally speaking run from S. to N. The most important schemes for intercommunication are the Lake of Constance and Danube canal, the Main–Danube canal, the Neckar–Danube canal, these last forming the so-called Rhine–Danube canal scheme. There are, moreover, the North Seaports canal, the Central (Mittelland) canal to connect Hanover and the Elbe, and the Elbe–Oder canal. Finally there are numerous plans for communication in the regions of the Oder, the Netze, the Weichsel and the Pregel, extending as far as the river Memel. Of these projects the Central canal and the canalization of the Upper Main, the Neckar and the Danube below Regensburg had been already approved. The execution of the plans for waterways is, however, extremely difficult. The reason for this is partly the internationalization of certain rivers, partly the lack of capital. An extension of the waterways according to the general scheme will only be possible in combination with the construction of great electrical works which could use the water-power and make the waterways pay. The prospect of this, however, is not very great in view of the slightness of the fall on most of the German rivers.

*Education.*—The school system in Germany is very highly developed. The number of illiterates is therefore very small, the few that exist being mainly foreigners who have come to Germany for work. The whole educational system is divided into general school training, technical school training, and training in higher institutes such as universities and technical colleges. For general school train-

ing the institutions are the national schools (*Volksschulen*), intermediate schools (*Mittelschulen*) and higher schools (*Realschulen*, *Real-Gymnasien*, *Gymnasien*). Up to 1921 the regular and periodical collection of school statistics had not been resumed. The last general statistics on the subject were compiled in 1911. At that date there were in Germany (old boundaries) 66,037 national schools, 1,249 intermediate schools, and 2,515 higher schools. In the public national schools there were 148,217 male and 39,268 female teachers, in the middle schools 6,278 male and 5,787 female teachers; and in the higher establishments the numbers engaged in teaching were 35,339, of whom 21,998 had enjoyed a university education.

In 1921 there were 23 universities, 11 technical colleges, 7 lycées, 3 veterinary colleges, 4 agricultural colleges, 3 academies of forestry, 2 academies of mining, 4 commercial colleges, 18 colleges for communal administration, art, industrial art, etc., and 11 of music.

The total number of male students in German universities (with the exception of Königsberg for which the figures could not be obtained) was in the winter half-year 1913–4 55,614, and, besides these, 7,848 persons were allowed to attend lectures. During the war years the numbers at first fell, but soon rose again; and after the end of the war, in the winter half of 1918–9, they reached the figure of 67,644. The highest point in the winter half of 1919–20 was 79,213 students. In addition 7,794 persons were admitted to lectures. In part this enormous rise is the result of an accumulation due to the impossibility of completing studies in the war years. In the summer half of 1920 there was thus a setback, the male students being only 76,392. In the winter half, 1920–1, there was a further fall.

Female students in the winter half 1913–4 numbered 3,649, and in addition 1,510 were admitted to lectures. In the summer half of 1920 the number of female students was 7,750, and 2,857 were admitted to lectures.

The technical colleges after the end of the war boasted an ever-increasing attendance. In the summer of 1913 there were only 11,705 male and 62 female students at these colleges. The numbers had risen in the summer term of 1920 to 20,505 male and 258 female students, and the attendance was still increasing. The study of architecture was less popular than formerly, while on the other hand there was an increasing rush to study machine-making and engineering, electricity, chemistry and mining and metallurgy.

(W. Gr.)

## German Finance, 1910–21

The period from about 1895 up to the outbreak of the World War in 1914 had been one of growing economic prosperity for Germany. From time to time the advance had been interrupted by intervals of depression, but they were short-lived, and when they passed the progress continued. Between 1907 and 1913, for instance, German coal production rose from 143 million tons to 191 million tons, or roughly by one-third; the production of lignite from 62¼ to 87 million tons, or two-fifths; of pig iron from 13 to 19·3 million tons, or nearly one-half. Germany's imports increased in this period by 2 milliards (thousand millions) of marks [1] (£100,000,000) and German exports by well over 3 milliards of marks (£150,000,000), the total foreign trade of Germany increasing from 15½ milliards (£775,000,000) to 20·7 milliards of marks (£1,035,000,000).

German imperial finance reflected economic progress only to a small extent in its budget. Confederation had left the Empire itself in a weak position financially by reserving the most important sources of taxation for the individual component states. The governing theory was that direct taxes appertained to the states, while the Empire must rely on indirect taxation. In spite of the general financial and economic prosperity, the imperial debt had risen in 1910 to 5,016 millions of marks (having been 1,240 millions in 1890, 2,201 millions in 1895, 2,418 millions in 1900, and 3,323 millions in 1905). German statesmanship had been slow to adapt the needs of the imperial budget to the changing conditions. In 1909, however, an important fiscal reform was introduced. New sources of revenue to a total amount of about 500 millions of marks were tapped; the long-continued period of recurring deficits seemed at an end, and the hope of surplus income appeared justified. The additional expenditure on armaments, necessitated by the army estimates of 1912 and the naval estimates of 1913, amounting to about 185 million marks, was covered by increases in the customs duties and new property taxes were introduced. It was proposed to cover the extraordinary expenditure, estimated at about one milliard of marks, by a single "defence tax," levied as a capital-tax on properties of 10,000 marks up to 15,000 marks at 0·15%, increasing to 1·5% on amounts of over 5 millions, and as an income-tax, starting with 1% on incomes of 5,000 to 10,000 marks and increased to 8% on incomes of more than 500,000 marks. This "defence tax," levied in 1914–5, brought in 976·9 millions of marks, but, as events turned out, it was merely swallowed up in the exigencies of war expenditure.

The imperial budgets for 1910–3, for total revenue and expenditure ordinary and extraordinary, showed the following figures, in thousands of marks:—1910, revenue 2,943,419, expenditure 3,024,260; 1911, revenue 3,057,592, expenditure 2,897,403; 1912, revenue 2,915,384, expenditure 2,893,337; 1913, revenue 3,698,829, expenditure 3,698,829. There was a deficit in 1910 of 80,841,500 marks, and in 1911 and 1912 there were surpluses of 160,188,800 and 22,046,400 marks respectively.

*War Finance.*—The pre-war "defence tax" was not an organic reform. It had provided the power to attack income and property as a source of imperial revenue, but only once. The Empire thus entered the war with an undeveloped system of taxation—without, indeed, any large current revenue from taxation which (like an income-tax) could easily be increased in proportion with the enormous requirements of the war. To introduce it during the war would not have been an easy matter, and the view prevalent in Government circles was not in favour of such a course. They counted on a war of short duration, and did not wish to exacerbate the feelings of the population, greatly distressed as it was through sacrifice of blood and life in the field as well as through the blockade, by imposing heavy burdens of taxation. They did not wish to interfere with the right of the individual states to obtain their own revenue from direct taxation, and desired to make as little alteration as possible in the existing arrangements. Therefore, the decision arrived at was that the cost of the war should be met not out of taxation, but by the issue of loans; only the interest on the loans issued was to be debited to the current budget and covered by income. The current budget itself was artificially assisted by taking out of it, at first in part and later in full, the largest items, *i.e.* the current expenses for the army and navy, and debiting them as extraordinary expenses of the war. In the course of the war, other expenses too, only indirectly connected with the war, such as bonuses to civil servants to compensate for the rise in prices, were debited to the war fund. On the other hand the revenue, which it was at first quite impossible to estimate, was simply included in the price of peace, although the most important part of it, for instance the customs revenue, suffered an immediate and very sharp reduction through the blockade and the resulting reduction in imports, as well as the suspension of customs duty on corn, grains and other articles of pressing need, which took place immediately on the outbreak of the war. It was a system which at first seemed to lighten the burden, but afterwards made it only heavier, and which, the longer the war continued, was found less and less adequate.

The German system of war economics was directed by the enormous demands of modern war on men and material on the one side and by the blockade on the other side. Strict economy was to be observed in all that was necessary for the war, especially in raw material required for war purposes and the not less important labour, while distribution was to be organized in such a manner that everybody received at least a share of the necessaries of life. To increase production to the utmost for the requirements of the war, and to make the whole of the economic system subservient to its satisfaction, was from the first the ruling idea. This transference of all economic activity to the needs of the war provided at the same time the financial means of carrying on the war. As the German people were increasingly, if not totally, cut off from foreign supplies, they were more and more dependent on home produce, and the profits of the war expenditure remained for the most part at home. The continuance of the regular savings system, combined with the

[1] Up to the outbreak of war, the German mark was practically equal to the English shilling (*see* Exchange, Foreign). Its subsequent depreciation in value makes it impossible to convert the later figures for paper marks, as given in this article, into their real money value. Only where gold marks are referred to, the pre-war parity with sterling holds good.—(Ed. *E. B.*)

retrenchment necessitated by the lack of opportunity for spending, liberated funds for investment in the war loans. In this process, however, the stocks of industry and commerce were drawn upon without being replaced; buildings, works and plant were used more fully, without attention being possible to necessary repairs; the agricultural land was farmed without its being invigorated by proper manuring; and finally the holdings of foreign paper and securities were liquidated as far as possible by transference to neutral countries in order to gain the means of paying for obtainable imports. Thus there went on a continuous using-up of the national capital, which was spent by the Government, and became for the private possessor paper mortgage bonds of the Empire.

At the outbreak of the war, loan-banks (*Darlehnskassen*) for making advances of money were established, which granted loans at a low rate of interest against pledged securities and goods. At the same time, in order to safeguard the gold reserves of the Reichsbank, its obligation to redeem its notes in gold was suspended. The indirect, proportionate "covering guarantees" of the Reichsbank were also abolished, *i.e.* the provision in the Bank Law that the Reichsbank had to pay 5% per annum to the Treasury on the amount by which the bank-note issue at any time exceeded the cash reserve *plus* a sum of 550,000,000 marks, or, on the quarterly balance, 750,000,000 marks. The Reichsbank was thus enabled to issue any quantity of bank-notes without increasing the discount rate. This, on the other hand, led to a constantly increasing deterioration of the proportion between the bank-note issue and the means of covering it. Still, the creation of the offices for advancing money (*Darlehnskassen*) and the abolition of the restriction on the note issue enabled Germany to dispense with a legal moratorium. A kind of substitute for a moratorium was furnished by the regulation empowering the law courts to grant delays, so that they could allow payments of cash and of mortgages to be deferred in cases of necessity. Men who were away at the front were in particular protected from proceedings for the enforcement of judgments. Lastly, debtors unable to meet their obligations were saved from bankruptcy and the consequent wasteful realization of their assets by a law (Aug. 8 1914) which enabled them to apply for an official control of their businesses (*Geschäftsaufsichtsgesetz*). According to this law the debtor could request the bankruptcy court to appoint a trustee to exercise supervision over business assets and their disposal, thus avoiding the personal disabilities and the effects as to property which are the normal consequences of public bankruptcy.

These were, on general lines, the sources whence the subscriptions to the war issues were derived. The Empire made the funds necessary for the war available at the issuing bank by discounting Treasury bills, and then appropriated in regular intervals the accumulated cash of the population ready for investment, by issuing war loans and funding the floating debt.

This system of war finance only succeeded completely up to the autumn of 1916. The first four war loans, with their subscriptions of 4,460 millions (autumn 1914), 9,060 millions (spring 1915), 12,101 millions (autumn 1915) and 10,712 millions (spring 1916), brought in sufficient to cover the Treasury bills issued up to that time. Up to the autumn of 1915 there was even a considerable surplus, which helped to finance the carrying-on of the war for the succeeding months. But from the autumn of 1916 this condition of affairs was altered. The war loans issued regularly every half-year continued to produce large amounts: 10,562 millions in the autumn of 1916; 13,112 millions and 12,626 millions in 1917; 15,001 and 10,443 millions in 1918. But the Treasury bills put into circulation regularly increased to a greater extent: in the autumn of 1916, 2 milliards remained uncovered; in the autumn of 1917 the amount had risen to 14½ milliards; in the autumn of 1918 to 39 milliards; and in Nov. 1918 when the Armistice was concluded, besides the 98 milliards in war loans there were already in circulation 50 milliards in Treasury bills as floating debt of the Empire, this total being subsequently still further increased.

The reason for this state of affairs was the enormous increase in the cost of the war and the continued rise in prices. The average cost of the war per month was estimated for the first year of the war at 1·7 milliards of marks, in the second year 2 milliards, in the third year 3 milliards, in the fourth year 3·8 milliards, and in the last year 4·4 milliards of marks. In the extraordinary budgets of the five years 1914–8, the general war expenses were as follows:—1914, 6,935·7 millions of marks; 1915, 23,908·9; 1916, 24,739·3; 1917, 42,188·4; 1918, 33,928·4. In the same years the total indebtedness of the Empire rose by 11·3, 22·1, 30·3, 36·3 and 50·9 milliards; to this must be added 13·5 milliards in obligations undertaken towards Germany's allies. The full amounts of the actual costs of the war, however, are not shown in these figures. Very considerable sums, as the accounts got more and more in arrears, only became due a considerable time after the war was over. These amounts and the cost of demobilization, reaching additional milliards, burdened for the most part the budgets of the years following.

The enormous increase of the State debt naturally resulted in a proportionate increase in the yearly expenses for interest. Where in 1913 the management and interest of the debt swallowed 147 millions, 375·6 millions were required in 1914, 1,248·2 millions in 1915, 2,518·5 millions in 1916, 4,248 millions in 1917 and as much as 6,430·9 millions of marks in 1918. At the same time important sections of the revenue declined. Customs, yielding in 1913 a revenue of 679·3 million marks, provided in 1914–8 only 560·8, 359·9, 348·3, 232·7 and 133 millions, the decline being plain evidence of the growing effect of the blockade. In the same way the profitable enterprises of the Empire (posts and telegraphs and railways—at that time still not including the lines belonging to the individual states) suffered under the influence of the war, and instead of being sources of revenue became burdens; in 1913 they showed a surplus of 140·9 million marks, but in 1914–8 they required subventions of 53·6, 42·2, 50·5, 139·8 and 596·5 million marks. The revenue from spirits dwindled considerably. It became therefore more and more a pressing necessity to find funds for the war, not only by the issue of war loans, but through taxation. In the summer of 1916 the tobacco duty, the stamp duty on freight notes, and postal and telegraph charges were raised, but the resulting improvement in returns was meagre and insufficient even to cover the interest on the debt. In 1917 came a coal-tax and duties on passenger and goods traffic, and in 1918 a number of taxes were increased and new taxes introduced—an increased bourse-tax, a turnover-tax, stamp-tax on bills, taxes on sparkling wines, beer, tea and coffee and mineral waters, etc., while the tax on spirits was extended into a monopoly. There came also increases in the direct taxes in the individual states, whose finances under the influence of the war were also suffering severely.

The most important new source of taxation, however, was the taxation of war profits. It started with the law of June 21 1916, which covered not only the profits gained on war products but any and all profit gained during the war from whatever source, *i.e.* the difference between the taxable property of end 1916 and end 1913, and which took from the property remaining intact a supplementary duty, in so far as the taxable property did not show a reduction of more than 10%. This supplementary duty was one per mille, and the duty on the increase 5% on the first 10,000 marks, rising to 50% on increases over 1,000,000. Then came a tax on the surplus profits of companies, beginning with 10% on a surplus profit of 2% on the capital up to 30% on a surplus profit of 15% on the capital, and further progressive super-taxes based on the total rentability of the companies. In 1917 an advance of 20% was claimed on this war-tax of 1916, and in 1918 this was further extended. The Imperial Government proposed, besides the existing charges, a single war-tax on income, which would hit people with an income of 20,000 marks at the rate of 3 to 20%. This was shelved through the traditional objection of the states, which were still disposed to combat the annexation of the revenue from direct taxation by the Empire. Instead, the surplus income per head, that is the difference between the peace-time income and the war-time income, where such difference exceeded 3,000 marks, was made the subject of a

tax calculated at 5% on the first 10,000 marks of the taxable surplus income, up to 50% if the difference in income amounted to over 201,000 marks. Then came the property-tax beginning with one per mille on the first 200,000 marks, rising to 5 per mille on a fortune of over 2 million marks. Thirdly, came a considerable increase of the tax on companies: it was based on a fixed rate of 80% on the surplus profit, which obtained a reduction of 10 to 50% only when the surplus profit did not exceed a very moderate amount or where it did not exceed a very moderate return on the capital. The final extension of the war-profit tax took place in 1919. It again hit the individual with a tax on the surplus income, commencing with 5% and rising to 70% on a surplus income of only 400,000 marks. The war-tax on companies was also repeated. More particularly a tax was levied on total increase of fortune between Dec. 31 1913 and July 30 1919 and that at an extraordinarily high rate. Exemption from the tax was allowed only up to an increase of 5,000 marks, from which amount the tax began with 10%, increasing to such an extent that an increase in fortune of 376,000 marks was taken in full and in no case could the taxpayer keep more than 172,000 marks of the increase. All that individuals gained during the war and the first period of transition over an increase of 172,000 marks was claimed by the State under this last extension.

The revenue from the war-tax of 1919 was estimated at 12 milliards, when it became law. In the years of the war the defence-tax, war-profits tax of 1916, and surplus-income tax of 1918 brought in the following amounts:—637·4 millions in 1914, 307·8 millions in 1915, 65·1 millions in 1916, 4,853·1 millions in 1917, 2,410·3 millions in 1918, and 1,136·4 million marks in 1919. The total yield of the defence-tax was 976·9 million marks; of the 1916 war-tax, with its increases, 5,777·1 millions; and of the 1918 war-tax 2,686·2 millions, a total of 9·4 milliards of marks.

Nothwithstanding these considerable amounts, and the increased revenue obtained through other forms of taxation, the German war budget was a most unfavourable one. The appended table gives the total revenue and expenditure of the Empire for the years 1914 to 1918, and, as already stated, a great part of the actual war costs are not included in the expenditure, as it only appears in the accounts for the years following:—

*Revenue and Expenditure 1914–8*
*(in millions of marks).*

| | Revenue | Expenditure |
|---|---|---|
| 1914 | 2,350·8 | 8,653·8 |
| 1915 | 1,733·2 | 25,708·4 |
| 1916 | 2,029·4 | 27,740·9 |
| 1917 | 7,830·3 | 52,015·4 |
| 1918 | 6,795·0 | 44,039·7 |

The war was financed, almost entirely, by an enormous increase in indebtedness, at first through issues of loans, and later, in ever-growing measure, through increasing the floating debt. The taxes and levies introduced during the war were barely sufficient to meet the current requirements, greatly increased through the interest on the debt as well as through decrease of revenue from peace-time sources. As far as the property and income-tax is concerned these were not permanent sources of income but were only available once, and terminated as soon as their result was obtained. But the expenses remained, and necessitated imperatively the replacement of the single levies through regular sources of revenue.

*After the War.*—It was in this desperate situation financially that the war came to an end. The collapse which followed it, together with the crushing conditions of the Armistice and the Peace Treaty, disorganized the whole economic and financial life of the country. The effect of the war appeared after the defeat with frightful clearness. Of the German population 1,700,000 were killed, 1,500,000 injured and thus had their capacity to gain a livelihood impaired. And the civil population, through the physical and moral strain of the war, showed a greatly increased mortality; more especially, countless children and old people were victims of the privations imposed by the blockade. The increased mortality of the civil population in 1919–20 is estimated at 800,000 souls. A still heavier blow was the fall in births through the separation of the sexes in consequence of the war. For the period of six years this reduction amounted to 3,700,000. Besides actual losses in numbers, there was also exhaustion of those who remained alive and the destruction of the means of productivity.

Superficial critics have been apt to observe that Germany itself was saved from the ravages of the war, since it was fought, with the exception of a short incursion of the Russians in East Prussia, outside its frontiers. Herein lies a fallacy. The German industrial works were not indeed destroyed, but the greater part of the machinery and plant was used up to the utmost by war production without there being a possibility of seeing to repairs and renewals. Similarly, the agricultural areas were exhausted. Industry and commerce had lost the materials that were used up in the war; cattle had gone from the stalls; transport undertakings were crippled to an incredible extent. At the end of March 1920 only 45·9% of the existing locomotives were usable, whereas at the end of July 1914 the number under repair was only 19·1%. Germany in the late autumn of 1918 was not only in a state of military defeat and political chaos; financially and economically it was at its last gasp. What was needed was help from abroad, through importation of foodstuffs and raw materials, which alone could facilitate a transition from war to peace conditions. A complete change in the direction of its productive energies was required. During the years of war production was solely for war requirements, the Government being the sole big buyer, always eager for goods; when the demand for war requirements stopped suddenly it was necessary again to produce for peace requirements, and to find a market for them. First and foremost there was the task of again taking into the labour market the millions of people released from the army and of finding places for them in agricultural and industrial undertakings, in the works and factories and offices. Elaborate plans for this demobilization of the army had already been made during the war. They were, as so many other schemes, rendered useless by the destructive conditions of the Armistice. The periods fixed for the return and release of the army were too short, and all organization in that direction collapsed. The enormous supplies taken for the army, the value of which was estimated at several milliards of gold marks, and the return of which was imperative for the use and nourishment of the people during the first part of the period of transition, could not be stored in the given time. Moreover, Germany had to deliver up to the Allies 5,000 engines and 150,000 wagons, and the transport crisis already threatened was thereby rendered complete. In accordance with the supplementary conditions of March 1919 Germany had to hand over the biggest part of its commercial shipping, and this again greatly increased the difficulties of distribution. Worse still, the blockade still continued for months, and thus there was the severest restriction of imports of necessary provisions and raw materials, for which also only inadequate means of payment were available. Terrible were the results of these regulations. Not only was the political and social crisis rendered more acute, but the German economic position was disordered to such an extent that repeatedly a total collapse seemed unavoidable. The result was the loss of hundreds of thousands of lives among the civilian population, whose weakened condition was unable to withstand the continued privations. According to an estimate based on 375 German towns of 15,000 inhabitants and over, as against 140 deaths per 10,000 in 1913 there were 175 deaths in 1919 and 158 in 1920. The mortality from tuberculosis alone was increased from 15·7 in 1917 to 27·1 in 1919, and in 1920 it was still as high as 18·4. That was not all. With the Armistice began the Allied occupation of the left bank of the Rhine and the bridgeheads on the right bank. A difficult economic situation was thus produced, which again became peculiarly acute in the spring of 1921 through the London "sanctions," for Germany lost control of her most important customs frontier; the "hole in the west" was torn open, and a flood of foreign goods, to the value of milliards of marks, poured without regulation or control into the starved country, aching for commodities of all descriptions. Whilst the German population was without the means to satisfy its re-

quirements in absolute necessaries, the country was flooded with foreign articles of luxury. Although masses were facing starvation, the carrying-out of the conditions, first of the Armistice and later of the Peace Treaty, permitted the classes which had profiteered out of the war and the revolution to satisfy their vulgar greed.

The Peace Treaty of Versailles, as adopted by the Allies in May 1919, and imposed on Germany by the threat of renewing the war, completed the work of economic ruin. Germany lost with its territories a total population of 5·3 million souls. With Alsace-Lorraine, moreover, Germany lost nearly three-quarters of its capacity for iron production; out of pre-war deposits of iron ore valued at 2·3 milliards of marks in Germany and Luxemburg (which had a customs treaty with Germany), there remained a value of only 0·403 milliard within the new German frontiers. Germany also lost with Alsace-Lorraine 26% of its potash. It lost with the transfer of the Saar valley to France roughly 9% of its pit-coal production, and was also obliged to agree to deliver to the Allies large quantities of coal, fixed in Oct. 1920 in Spa at 2 million tons per month. It was threatened with the loss of Upper Silesia, which had produced 23% of German pit-coal, 80% of zinc and 61% of raw zinc. Germany lost, moreover, almost all its commercial shipping, all overseas cables, its colonies,—in fact all the bases of its commerce abroad. Germany lost in the N. and the E. of its empire large agricultural districts which had formerly furnished about 25% of its supply of grain and potatoes, and 10 to 12% of its cattle. And while the Peace Treaty thus raised for Germany the crucial question whether it would be at all possible in future to supply a population now amounting to 61 million souls with nourishment and occupation on German soil—whether indeed within its new frontiers it was not really a case, from the economic point of view, of "20 million souls too many"—the country also found itself burdened with external financial obligations of unexampled magnitude by way of reparation payments to the Allies.

*The Depreciation of the Mark.*—The first effect of the defeat, —the internal collapse, and the terms of the Armistice and the Peace Treaty,—was the almost total breaking-down of the German currency system. The depreciation of the mark abroad had pursued a progressive course already during the war. In consequence of the blockade, and of increasing demands for war requirements in industrial production, German exports had declined much more quickly than the imports; and since the cover formerly available for excess of imports, arising from shipping charges, freights, etc., failed entirely and foreign investments were largely unrealizable, it was almost impossible to obtain credit abroad, which in normal times would have covered the deficit. By the end of the second year of the war (summer of 1916) the exchange in Switzerland, for instance, had fallen from a normal rate of 123·46 francs per 100 marks to 95·60 francs, showing a loss in exchange of 22·60%. Though depreciation still went on, in Oct. 1918 the Swiss rate was still as much as 71·50 francs and the loss in exchange not more than 42·10%. But after the end of the war the fall became steeper. The Swiss exchange was 62½ francs per 100 marks at the end of Nov. 1918, and the rate descended month by month to 35½ francs at the end of May 1919, and then, after a brief reaction, to 26 francs at the end of Sept. 1919, 11·50 francs on Dec. 31 1919, and 6·15 francs (equal to a loss of 95%) at the end of Feb. 1920. From this point there was again a reaction in the summer of 1920, and on May 31 1920 the Swiss rate was 14·75 francs, but in the autumn of 1920 the depreciation recommenced, and towards the end of June 1921, the Swiss exchange for 100 marks was 8·10 francs. (*See* EXCHANGES, FOREIGN, for the German exchange.)

German currency depreciation during the war, as well as afterwards, was one of the factors which restricted the possibility of getting help from foreign capital. And though the value of money in Germany itself declined much more slowly than the mark exchange abroad, another result was that foreign purchasers were able to buy whatever was obtainable in Germany, stocks of goods and merchandise, town property, securities, plant and machinery, up to complete industrial enterprises, at catastrophically low prices. Another consequence was an enormous increase in German indebtedness towards foreign countries. The German mark note became the gambling counter of the world. The German notes went abroad in milliards at ever-falling rates in payment for imported goods, to be bought up by big and little speculators, down to the hotel porter and the domestic servant who hoped to profit by any rise in exchange. Enormous foreign holdings of mark notes resulted also from credits given by banks in marks, also with an eye on an improvement in the exchange. Only in this way was it possible for Germany to pay for its large excess of imports over exports, which marked the destruction of Germany's economic position in these years of greatly reduced production at home. The price was a foreign indebtedness, the yearly burden of which in interest charges was estimated at the end of 1920 by competent judges at one milliard gold marks and by some critics at an even larger figure.

Apart from all other difficulties attending economic reconstruction after the war, every attempt of Germany to reach a real internal consolidation was hampered by the monetary instability. On the one hand it raised prices, and on the other it depreciated the value of property and income. While, towards the end of the war and just after, wages had often been increased beyond the rise in prices, so that a moderate increase in real wages resulted to the worker, it was not possible to continue this for any length of time in view of the unhappy state of production. Much less was it possible for people enjoying fixed incomes, officials, civil servants, and brain-workers, to increase their income in proportion with the reduction of money value, and they sank lower and lower in the social scale. The worst sufferers were people relying on incomes from rents. Every reduction in the value of money amounted to a favouring of the debtor at the expense of the creditor. Those who had invested their capital in Government securities, mortgages, etc., at fixed rates of interest, were helpless against the reduction in money value, which reduced their capital as well as the interest to a fraction of its former amount. Producers themselves might be able, through the rise in prices, to obtain some compensation for the reduction in the value of money. But any such compensation could only be reached by a very small part of the population. No doubt, as in all periods of economic revolution, some lucky people found the means of enriching themselves to an extraordinary extent. But the high profits nominally realized by many German companies, if the amount were reduced to the actual value of money, represented not only no advantage, but a loss if compared with pre-war times. The large middle class was hit particularly hard. This class, the main repository of national culture, was in danger of being swallowed by the proletariat.

Such a situation was bound to influence the State finances to a deplorable extent. Whatever services were required had to be paid for at a nominally higher rate. It was necessary too to spend enormous sums on subsidies for reducing the price of necessaries to the public, for keeping down the cost of transport, and for the relief of the unemployed. On the other hand, uneconomic State finance was itself a factor in the decline of money values. The State had to cover its financial requirements in default of taxation by further issues of paper money, increasing from week to week and month to month.[1] It was itself the producer of the artificial purchasing-power which brought in its train the continued rise in prices. The bank-note press, in substitution for the taxation machine, created a continually growing inflation. It was the uninterrupted use of the printing-press, as a means of meeting the expenditure, that characterized State finance in the first years after the collapse.

*Taxation Reform, 1919–20.*—The National Assembly of the new German Republic had to face the task of laying the foundations of a new financial system and re-creating it out of chaos. The old privileges of the separate states of the Empire, in depriving the central Government of the benefit of the most important sources of tax-revenues, had to go. The German Reich now had

[1] On Jan. 1 1919, the regular note issue amounted to 29,188 million paper marks (as against 11,467 millions a year earlier) and the Reichsbank note issue to 10,109 millions (6,264 millions in 1918). On Jan. 1 1922 the total was about 120,000 millions.

to bear by far the largest part of the costs of the war, the interest on the war debts, the war pensions and compensations, the whole of the burdens of the Peace Treaty, etc.; these swelled the budget expenditure to such an extent that the requirements of the individual states were left far behind. The great sources of direct taxation had now to be made free for obtaining revenue for the Reich. Events had made compulsory a strong centralization in German finance. By an order of the Finance Department of the Reich on Sept. 10 1919, the management of all fiscal levies was handed over to the central Government. A further order, of Dec. 13 1919, provided for the formal right of taxation. A decisive step was taken in the National Taxation Law of March 22 1920, which fixed on a new basis the position of the three great receivers of taxes, the Reich, the individual states, and the subordinate local Governments towards each other. Whereas the pre-war rule was that the use of certain sources of taxation by the individual states forbade the Imperial Government to use such sources, the new regulations reversed the position, ruling that the use of certain sources of taxation by the Reich forbade the collection of similar taxes by the individual states and local communities unless expressly empowered to collect a supplementary levy. Counties and municipalities kept their most important independent tax sources—the taxes on landed property and industrial activities. They were obliged to levy an amusement-tax, and were entitled to tax the lowest incomes which escaped the general income-tax. In principle they became pensioners of the State, receiving of the revenue from Reich taxation two-thirds, of the companies-tax also two-thirds, of the inheritance-tax one-fifth, of the tax on acquistion of landed property one-half, and of the turnover-tax 15% (*i.e.* 10% for the counties and 5% for the municipalities). This was a most important step in the direction of laying a sound basis for Reich finance.

In the place of the various tax departments of the individual states there had to be created the gigantic machinery of a central Finance Department for the entire Reich. It could not come into existence without much early trouble and failure. The new department was at first quite unable to carry out the regulations, and only slowly and gradually came the introduction and collection of new taxes. And another difficulty followed quickly in consequence of the new regulations for financial management. The unification of the railways in Germany had been, like the unification of taxation, an old demand, but one which could not be carried out in times of peace, when the railways were a valuable source of revenue to the states, more especially to Prussia. Now it was accomplished, and the Reich, which previously had managed only the railways of Alsace-Lorraine, from April 1 1920 took over all the railways. But the railways, instead of bringing in a profit, now found themselves with a deficit. From the moment, however, that the Reich had taken over the important sources of tax revenue, it was obliged to take over the railways as well, since the individual states were not able to carry their losses, and these losses now fell on the Treasury of the Reich.

With this basic change in organization came now the extension of the field of taxation. Between Sept. 1919 and March 1920 a system of new taxes for the whole Reich was created. The taxation of income was carried out in three different ways.

First comes the unified tax on income, which came into force on April 1 1920. The rate of taxation is as follows:—

| *Amount of Income* | *Rate per cent* |
|---|---|
| For part or the whole of the first 24,000 marks. | 10 |
| For every additional (whole or part) 6,000 " | 20 |
| " " " " " " 5,000 " | 25 |
| " " " " " " 5,000 " | 30 |
| " " " " " " 5,000 " | 35 |
| " " " " " " 5,000 " | 40 |
| " " " " " " 70,000 " | 45 |
| " " " " " " 80,000 " | 50 |
| " " " " " " 200,000 " | 55 |
| " all further amounts | 60 |

Thus, 60% of any income exceeding 400,000 marks (now paper marks) has to be handed over as tax to the Treasury. On an income of 30,000 marks the tax is 3,600 marks; on 50,000 marks it is 10,000 marks; on 200,000 marks it is 81,600 marks; and on 1,000,000 marks it is 551,600 marks.

A reduction in these rates is allowed only in so far as an existence minimum and the numbers in the family are taken into consideration. This is arranged so that, for every person subject to pay tax and for each member of his household not independently taxed, the taxable amount of income is reduced by 120 marks, provided the dutiable income does not exceed 60,000 marks, and by 60 marks where the income is between 60,000 and 100,000 marks. A married man subject to the tax, with four children and an income of 24,000 marks, will, for instance, obtain a reduction of 720 marks. Taxation of those who receive salaries or wages is assured by making the employer answerable for retaining from the salary or wage a proportionate amount in advance and paying it over to the tax collector.

To this income-tax, affecting the total income of the subject, is added, as super-tax, a levy on income from investments, in distinction from earned income, *i.e.* from dividends on shares, etc., interest on loans and mortgages of all kinds, interest on advances of any description, especially on deposits in banks and savings banks, rents, etc., and discounts on bills, including Treasury bills. The tax is 10% on the whole return on the capital. An exception is made only in the case of small investors over 60 years of age or incapacitated from work. These have the tax on returns from capital included in their income-tax, as follows: on an income of not more than 5,000 marks, the whole amount; up to 6,000 marks 90%, the rate being reduced with every further 1,000 marks by 10%. On incomes of over 14,000 marks this relief terminates.

The third form of taxing incomes is the companies-tax, which operates as a super-tax on enterprises carried on by companies, including foundations, institutions and other societies for the management of property. This tax is 10% generally, on the total dutiable income. For societies working for gain (companies with shares, societies with limited liability, etc.) there is, in addition, a special tax on the distributed profit, calculated on the proportion of the distributed amounts to the capital, so that where the profit is only 4% on the capital the tax is 2% on the distributed amounts, rising by 1% up to 10% of the distributed amounts if the profit on the capital is 6, 8, 10, 12, 14, 16, 18% and over. The first 3% of profit on the capital is tax-free.

The total taxation on income, from the three forms of levy, works out as follows: Income from shares, for instance, is taxed under each of the three forms. The company itself has to pay on its income in proportion to its own liability; then the distributed profit is reduced by the 10% tax on return from capital; and finally the shareholder has to pay income-tax on his dividends.

Taxation on property (capital) was also imposed in three forms. First of all came the war-tax (*Kriegssteuer*) on property increase, which hits any increase of over 5,000 marks in the value of property during the war and immediately after the war (difference in property between June 30 1919 and Dec. 31 1913), nobody keeping a larger increase than 172,000 marks. The following table (in marks) indicates its working:—

| *Increase in Property* | *Amount of Tax* |
|---|---|
| 10,000 | 1,000 |
| 15,000 | 1,750 |
| 20,000 | 2,500 |
| 25,000 | 3,500 |
| 30,000 | 4,500 |
| 35,000 | 6,000 |
| 40,000 | 7,500 |
| 50,000 | 10,500 |
| 100,000 | 30,500 |
| 150,000 | 55,500 |
| 200,000 | 83,000 |
| 300,000 | 148,000 |
| 400,000 | 233,000 |
| 500,000 | 333,000 |
| 800,000 | 633,000 |
| 1,000,000 | 833,000 |
| 2,000,000 | 1,833,000 |
| 4,000,000 | 3,833,000 |
| 5,000,000 | 4,833,000 |
| 10,000,000 | 9,833,000 |

Through this war-tax increase in property is for the greater part annexed. But secondly, a further tax levied for the "need of the Reich" (*Reichsnotopfer*) makes a deep inroad on unincreased property, as calculated on Dec. 31 1919. This affects companies, especially companies with shares, and other societies for gain, on their net property, that is without the paid-in capital and without reserve funds intended for general utility or benevolent objects, at a rate of 10%. It also applies to the property of individuals, leaving only a property of 5,000 marks tax-free, though in the case of married couples this is increased to 10,000 marks tax-free, and, for those who have children, a further amount of 5,000 marks tax-free is allowed for the second and each additional child. Consideration is also extended in the case of proprietors of industrial enterprises who are liable to be hampered by the depletion of capital, the capital employed in the business being calculated not to the full amount but only up to 80% of its value.

The rate for individuals is as follows:—

| | | | |
|---|---|---|---|
| First 50,000 marks (in full or in part) | 10% | Next 200,000 marks | 35% |
| Next 50,000 marks | 12 | " 500,000 " | 40 |
| " 100,000 " | 15 | " 500,000 " | 45 |
| " 200,000 " | 20 | " 1,000,000 " | 50 |
| " 200,000 " | 25 | " 2,000,000 " | 55 |
| " 200,000 " | 30 | " 2,000,000 " | 60 |
| | | All further amounts | 65 |

This works out as set forth in the following table:—

| Taxable property | Amount of tax | Taxable property | Amount of tax |
|---|---|---|---|
| 1,000 marks | 100 marks | 350,000 marks | 56,000 marks |
| 5,000 " | 500 " | 400,000 " | 66,000 " |
| 10,000 " | 1,000 " | 450,000 " | 78,510 " |
| 15,000 " | 1,500 " | 500,000 " | 91,000 " |
| 20,000 " | 2,000 " | 550,000 " | 103,500 " |
| 25,000 " | 2,500 " | 600,000 " | 116,000 " |
| 30,000 " | 3,000 " | 650,000 " | 131,000 " |
| 35,000 " | 3,500 " | 700,000 " | 146,000 " |
| 40,000 " | 4,000 " | 750,000 " | 161,000 " |
| 45,000 " | 4,500 " | 800,000 " | 176,000 " |
| 50,000 " | 5,000 " | 850,000 " | 193,500 " |
| 55,000 " | 5,600 " | 900,000 " | 211,000 " |
| 60,000 " | 6,200 " | 950,000 " | 228,500 " |
| 65,000 " | 6,800 " | 1,000,000 " | 246,000 " |
| 70,000 " | 7,400 " | 1,500,000 " | 446,000 " |
| 75,000 " | 8,000 " | 2,000,000 " | 671,000 " |
| 80,000 " | 8,600 " | 2,500,000 " | 921,000 " |
| 85,000 " | 9,200 " | 3,000,000 " | 1,171,000 " |
| 90,000 " | 9,800 " | 3,500,000 " | 1,446,000 " |
| 95,000 " | 10,400 " | 4,000,000 " | 1,721,000 " |
| 100,000 " | 11,000 " | 5,000,000 " | 2,271,000 " |
| 150,000 " | 18,500 " | 6,000,000 " | 2,871,000 " |
| 200,000 " | 26,000 " | 7,000,000 " | 3,471,000 " |
| 250,000 " | 36,000 " | 8,000,000 " | 4,121,000 " |
| 300,000 " | 46,000 " | For each additional 1,000 marks 650 marks more | |

The tax has to be paid in cash or in war loan, but may be paid in yearly part payments, the unpaid amount being charged 5%, and it must be paid off within 26 years. If real property is given as security, where the payment is secured by entry in the official register 46 years are allowed for payment.

The third form of property-tax, inheritance duty, consists of a considerable extension of the former inheritance- and gift-tax, with the addition of a succession-tax after the pattern of the English estate duty. Inheritance- and gift-tax are calculated under six classes, according to the relationship of the beneficiary:

Class 1—Wife or husband and children, including illegitimate children recognized by the father.
Class 2—Descendants of the children.
Class 3—Parents, brothers and sisters.
Class 4—Grandparents, descendants of first degree of brothers and sisters, parents-in-law, step parents, children-in-law, step children and adopted children.
Class 5—Descendants of second degree of brothers and sisters, brothers and sisters of the parents, brothers- and sisters-in-law.
Class 6—Other beneficiaries (except as regards communities, churches, benevolent and utilitarian societies, foundations, etc., in which case the rate is always 10%).

The following are the rates of the tax per cent for the different classes, an allowance, however, being made for 5,000 marks being tax-free for the first five classes, and 500 marks for the sixth class:—

| | Class 1 | Class 2 | Class 3 | Class 4 | Class 5 | Class 6 |
|---|---|---|---|---|---|---|
| For first 20,000 marks taxable part or full | 4 | 5 | 6 | 8 | 10 | 15 |
| For following 30,000 marks | 5 | 6 | 8 | 10 | 12 | 20 |
| 50,000 " | 6 | 8 | 10 | 12 | 15 | 25 |
| 50,000 " | 8 | 10 | 12 | 15 | 20 | 30 |
| 50,000 " | 10 | 12 | 15 | 20 | 25 | 35 |
| 100,000 " | 12 | 15 | 20 | 25 | 30 | 40 |
| 200,000 " | 15 | 20 | 25 | 30 | 35 | 45 |
| 250,000 " | 20 | 25 | 30 | 35 | 40 | 50 |
| 250,000 " | 25 | 30 | 35 | 40 | 45 | 55 |
| 500,000 " | 30 | 35 | 40 | 45 | 50 | 60 |
| All further amounts | 35 | 40 | 45 | 50 | 60 | 70 |

The highest rates apply where the taxable benefit exceeds one and a half million marks. The tax increases by 1% of the amount; that is, if the already existing property of the beneficiary is 100,000 marks but not over 200,000, for each 10,000 marks; where the existing fortune exceeds 200,000, for each 20,000 marks. The increase must not exceed 100% of the tax. The total of the inheritance duty must not exceed 90% of the benefit. For a legacy arising before April 1 1935 the tax is reduced 1% for each year down to April 1 1925, and for each earlier year 2%. Reduction down to March 31 1921 is therefore 20%.

The succession duty (estate duty) is calculated solely on the property which has been left, without reference to relationship or number of beneficiaries; it applies to landed property, business capital, and personal property in so far as it exceeds 30,000 marks. The tax does not apply to gifts between living persons. The rate of tax is, for the first 200,000 marks (part or whole), 1%; for the following 300,000, 2%; for the following 500,000, 3%; for the following 1,000,000, 4%; and for further amounts 5%. If the value does not exceed 200,000 marks the first 20,000 marks are tax-free.

It is necessary to consider the effect of all these taxes together on property and income, to obtain a clear idea of what the burdens mean. At the Brussels Conference of 1920, the German Government submitted to the British delegates a statement which gives examples in explanation:—

*Example No. 1.*—A private individual with property worth on June 30 1919 100 million marks, showing an increase of 25 millions, dies in 1920 and leaves his property to two nephews in equal shares. One nephew has no property, the other has property stated at one million marks. Taxation on the 100 millions is as follows:—

| | |
|---|---|
| (1) War-tax on increase | 24,828,000 marks |
| (2) "Need of Reich" levy, on balance of 75,172,000 marks | 47,779,550 " |
| (3) Succession duty on property (27,392,450 marks) | 1,332,622 " |
| (4) Inheritance duty to be paid by nephew who has no property | 5,032,245 " |
| (5) Inheritance-tax to be paid by nephew who has property of 1,000,000 | 7,548,367 " |
| Total taxation | 86,520,784 marks |

There remains, of the original property of 100,000,000, only 13,479,216.

*Example No. 2.*—A private individual has property worth 10,000,000 marks of which 4,000,000 are from shares in a company for gain, which could have paid in 1920 a dividend of 20%. If it had not been obliged to pay companies-tax. The rest is landed property, returning 5%. There is no increase in property. Without taxes this person would have an income of 1,100,000 marks per annum. The "Need of Reich" levy exacts 5,417,750 marks, leaving 4,582,250 marks. The untaxed income on this would be 800,000 marks from dividends and 29,112 marks from rents, or 829,112 marks. This is reduced by 160,000 marks for companies-tax, 64,000 marks for return on capital, and 315,160 marks for income-tax, leaving an income of 289,952 marks.

*Example No. 3.*—A private individual has property worth 1,000,000 marks; no war profit. Property rented out brings 5%. One-third of the "Need of Reich" levy (244,250 marks), 82,250 marks, is paid, leaving a balance of 162,000 marks, on which there is 6½% interest to pay. On the remaining property, 917,750 marks, the income is 45,887 marks. Out of this there is to be deducted:—6½% on 162,000, 10,530 marks; return on capital-tax, 4,588 marks; income-tax, 7,272 marks; or 22,390 marks in all, leaving the remain-

ng income at 22,497 marks. This person, who before the war, after deduction of tax, had an income of about 45,000 marks (or say £2,250), had thus, in 1920, after deduction of taxes an income not merely reduced by half, but, in view of the depreciation of money, no better than that of an ordinary working-man.

The work of tax reform under the young German Republic was not exhausted by this extension of direct taxation. There was added a great extension of indirect and transport taxation. Its most important item was the tax on turnover. At first it consisted in a stamp duty of one per mille, rising in the last year of war to five per mille, but by the National Assembly's regulation of Dec. 24 1919, which came into force on Jan. 1 1920, it was fixed at 1½%. This turnover-tax is applied also to articles of luxury, specially mentioned, at a rate ten times increased, namely 15%. Further it includes a restaurant-tax, advertisement-tax, cloakroom-tax, etc., etc., and covers certain kinds of service such as letting-out furnished rooms, taking in advertisements, holding in trust money, securities, valuables and furs, letting riding horses on hire, the rate of tax being 10%. It is to be noted that the normal rate of 1½% does not represent the total amount, which really is very much higher on the average, and in the case of semi-manufactured and manufactured goods it has to be paid as many times as the commodity changes hands. The tax is therefore a real tax on consumption in the largest sense. Similarly, the coal-tax is collected at 20% on the value at the pit-head, and rises in proportion with the selling-rates. Various single taxes on tobacco, matches, playing-cards and sales of real property were also to be added, as well as repeated increases in the charges for letters, telegrams, postal-orders, trunk-telephone messages and railway rates.

A gigantic increase of the burden of taxation on the whole of German national economy was the result of these reforms, though even then they were not sufficient to balance the budget of the Reich.

*Development of Reich Finance, 1919–21.*—The most significant feature of the financial position in these first years after the war was the rapid increase in the national debt. The figures each year were as follows, in milliards of marks:—

| | Funded debt (Treasury bonds and interest-bearing Treasury notes) | Floating debt (Treasury notes without interest) | Total |
|---|---|---|---|
| March 31 1918 | 71·9 | 33·3 | 105·2 |
| March 31 1919 | 92·4 | 63·7 | 156·1 |
| March 31 1920 | 92·0 | 91·5 | 183·5 |
| March 31 1921 | 78·3 | 176·6 | 244·9 |

The reduction shown in the funded debt in 1921 arises from cancellation by means of collection of war-tax and "Reich need" levy, and by the sale of army property. Against this the increase in floating debt in 1921 includes a part of the purchase price paid by the Reich on taking over the railways from the individual states, whilst, on the other hand, a number of other obligations are not included. If these are taken into consideration, and the Reich and the individual states are taken together, there appears for Oct. 1 1920 a total debt of 294·8 milliards of marks, compared with 22 milliards on March 31 1914. The large increase of debt was the result of slow returns from the new taxation, the depreciation of money which continually caused a greater expenditure on goods and services and repeatedly upset the budget estimates, the subsidies given on necessaries in order to adjust prices to the depreciation of money, the large rise in the interest charge on the debt, the deficits on the railways and post-office, and finally the beginning of large payments under the provisions of the Peace Treaty.

In the regular budget for 1919 a revenue was shown of 12,753 million marks and expenditure of 15,987 millions (of which 8,389 millions was for debt alone). The deficit was covered for the most part though returns from the taxes on war profits. Not so the extraordinary budget, which showed a revenue of 4,154 millions of marks and an expenditure of 39,779 millions. The deficit of 35,625 millions had to be covered by loans. Very large items of arrears in war expenditure were included here, and it seemed justifiable to hope that, with the closing of such expenditure, the deficit would be reduced. But the opposite came to pass. The estimate for 1920, in which for the first time larger returns from the new taxes were included, forecast in the ordinary budget a revenue and expenditure of 30,891 millions, or more than three times the revenue estimated for the previous year; and under the expenditure 12,693 millions was included for the service of the Reich debt, 3,967 millions for pensions and 9,405 millions for the states and local governments as their share in the new Reich taxes. The extraordinary expenditure was estimated at 52,579 millions, of which 3,955 millions was for the paying-off of the old army and 41,440 millions for the execution of the Peace Treaty, while losses on the postal, telegraph and railway management were put down at 19,221 millions, so that there remained to be covered by loans a total of about 70 milliards, besides 3½ milliards representing deficits in the individual states. Unfortunately the event did not contradict these unfavourable estimates. The revenues from direct taxation, transport duty, customs, tax on consumption and other levies, brought in 46·10 milliards, or an excess of 37·70 milliards compared with the previous year and even an excess of 6·10 milliards over the estimate, largely as a result of the "Reich need" levy, by which 9·33 milliards was collected (the estimate having been 3½ milliards). From the new income-tax 9·59 milliards was received (estimated at 12 milliards), from the new tax on return of capital 909 millions (estimated 1,300 millions), from the newly extended tax on turnover 4·2 milliards (estimated 3·65 milliards). The coal-tax brought in 4·67 milliards, an increase of 3·32 milliards over the previous year; the new tobacco duty brought 1·76 milliards. But the total net revenue accruing to the Reich after deduction of the costs of collection and the amounts transferred to the states and local governments was only 27·7 milliards and the net expenditure was 73·7 milliards, in addition to 10·4 milliards for interest on debt and 18·2 milliards for subventions and for cost of management of railways and post-office. There resulted a deficit of 74·9 milliards which again could be covered only by an increase in the floating debt.

This disastrous picture was repeated in the 1921 budget. On March 26 the provisional estimate, passed in the Reichstag, provided for an expenditure of 46,945 millions in the ordinary budget and 43,667 millions in the extraordinary budget. Three months later a supplementary estimate entirely upset these figures. Expenditure in the ordinary budget was now put at 48,459 millions, the estimated deficit of 4,250 millions on the revenue side requiring to be covered by fresh tax proposals. The expenditure in the extraordinary budget was placed at 59,680 millions, against which there was an estimated revenue of 10,500 millions (of which 7,800 millions would come from the "Reich need" levy). The subventions for post-office and railways were estimated at 18,383 millions. Here was a deficit, in round figures, of 50 milliards of marks, apart from one of 4½ milliards on the ordinary budget. No allowance is included here for the reparation payments to the Allies.

As in the accounts for 1920, the liabilities under the Peace Treaty made a considerable showing by themselves in the budget for 1921, the estimate being 26½ milliards. The delivery of live animals involved three milliards; the costs of the settlement department for the liquidation of the pre-war debts between German subjects and those of former enemy countries were provisionally placed at two milliards; for reparation deliveries, apart from shipping, cables and cattle, 8,630 millions. The cost of Allied troops of occupation on the Rhine was put down at 7,266 millions, further augmented by 757 millions for the cost of land and buildings for their use, together with further incidental expenses. For the Rhineland Commission itself 109 millions was estimated, besides 1,220 millions for economic help for the occupied territory, to which the states and local governments had to contribute. Finally there came the reparation demand, which put before Germany economically and financially a problem of tragic magnitude.

*The Reparation Demand.*—According to article 233 of the Versailles Peace Treaty the Reparation Commission fixed on

May 5 1921 the amount of the war indemnity to be furnished by Germany and arranged the scheme of payments. By a renewed threat of an ultimatum the Government of the German Republic was forced on May 10 1921 to declare that they were "resolved to comply with the obligations placed on them by the Reparation Commission without reserve and without conditions." The total burden to be borne by the people of Germany was fixed at 132 milliards of gold marks, to be reduced, on the one hand, by the sums already paid on account of reparations and such sums as were to be credited to Germany according to the Peace Treaty or by decision of the Reparations Commission, but to be increased, on the other hand, by the taking-over by Germany of Belgium's debt to the Allies. Germany was required to deliver bonds in three series, of which the first two, in amounts of 12 to 38 milliards of gold marks, were to be issued at latest by July 1 and Nov. 1 1921 respectively, while the last series of 82 milliards subject to the above-mentioned modifications was also to be issued and delivered by Nov. 1 1921, but was only to be put into circulation by the Reparations Commission so far as their bonds were secured by the German annual payments. The interest on the bonds was to be 5%, the yearly sinking-fund 1%. For this purpose Germany had to provide a fixed annuity of two milliards of gold marks, besides a variable annuity corresponding to 26% of the annual value of German exports, or a proportionate sum to be fixed by further agreements. According to the existing position shown by the amount of German exports this meant an annual payment of 3 to 3½ milliards of gold marks, added to which were the other burdens of the Peace Treaty, the cost of the occupation, payment for liquidation of foreign claims, and similar charges. On the basis of the current value of German money, this meant a yearly burden of about 60 milliards of paper marks.

The financial prospects for Germany in 1921, on these calculations, might be regarded, from a German point of view, as apparently only too clear. If the 1921 estimates placed the total budget expenditure at about 108 milliards, with a revenue deficit of about 54 milliards, both these amounts would be increased (until means to cover the deficit had been found) by 50–60 milliards. And with this it could not be expected that the highest point had been reached. If the depreciation of German money went still further, as it must do if Germany was forced by financial necessity to decrease the subventions for the cheapening of means of existence, and, in order to reduce the budget deficit, increased the postal and railway charges as well as the price of coal, the expenses of the Reich for official salaries, wages of labour and other requirements must grow automatically, and for this further cover must be found. A further increase of the floating debt, by resorting to the help of the printing-press in the issue of bank-notes, could only lead to a catastrophe. Only one alternative was visible, and that was to open up new sources of revenue for the Reich. But that would mean, in view of the concurrent financial requirements of the states and local governments, that year by year an amount of perhaps 200 milliards of marks would have to be drawn forcibly into the Treasury through the power of the Government from the hands of private earners of income and possessors of property. It remained to be seen whether any Government, and particularly one so weakened by national disorganization, could exercise such power.

Apart from the internal financial difficulty, there was also the economic problem: how Germany was to make payments abroad in such immense amounts annually. Germany in 1921 had not only a financial but also an economic deficit. Its imports had exceeded exports annually since the end of the war by several milliards of gold marks. Only by increasing foreign indebtedness and by transferring abroad considerable parts of the property of the German population had it been possible hitherto to cover this economic deficit, and an enormous additional economic burden had already resulted from the liability for interest on this debt. This method of adding to the foreign debt and financing the operation by transference of the substance of the people's wealth might be pursued still further in order to meet the demand for reparation payments. But its limits were bound to be relatively narrow. For permanent use there could only be one really practical means of payment, by obtaining a favourable trade balance in an excess of exports over imports. Germany must strive to restrict internal consumption still further, and, to increase production, it must reduce imports and increase exports to the utmost. It was a strange piece of irony, and a contradictory policy difficult for Germany to understand, that the very Powers which were imposing the demand for reparations were at the same time hampering and restricting German production by economically closing up the Rhineland through the "sanctions" resorted to in 1921, instead of furthering such power of production and allowing it to develop. If they wilfully stimulated the imports of luxuries into Germany through the "hole in the west," although the stoppage of such imports would help to provide reparation money for them by economies on the part of German consumers; if they sought to render German exportation more difficult by stringent customs regulations, in spite of the fact that an increase in German exports was the obvious economic method of complying with the reparation demand—in spite, indeed, of the fact that, through the export index, according to which 26% of the value of the current German export trade was to be taken as the amount of the variable annuity, any increase in exports would mean a rise in the yearly amount payable—the position would then become self-contradictory, and, for Germany, more and more hopeless.

Even without such embarrassments it remained to be seen how, on the one hand, Germany could attain the necessary increase in production in the short time contemplated, and whether, on the other hand, international commerce would be able to adjust itself economically to an acceptance of Germany's increased supply of goods and services, while at the same time producers elsewhere had to deny themselves a market in Germany owing to its being without means to buy.[1]

It must be sufficient here to indicate these problems, which faced all parties in 1921. The German Government had in May–July declared its fixed will to overcome them and to fulfil to the utmost the obligations that had been undertaken. It

[1] It should be observed that in the middle of Aug. 1921 it was calculated by the *Frankfurter Zeitung* that the wholesale prices of commodities had risen 16-fold in Germany since 1914. Consequently a commodity which had cost 20 marks (then equal to £1) before the war had come to cost 320 marks, which, as it happened, was also in mid-Aug. 1921 just about the value of £1 in the exchange market. That is to say, £1 sterling would buy in Germany just about the same amount of commodities at wholesale prices in mid-Aug. 1921 as before the war, in spite of the 16-fold rise. On the other hand, in England during the same period the rise in wholesale prices represented an addition of 80%, so that in mid-Aug. 1921 it cost there about £1 16s. to buy the same amount of commodities wholesale which could have been bought for £1 before the war. Consequently, in respect of this difference at all events, German manufacturers and traders were in a position of advantage over British in being able to underbid them in the sale of goods. To equalize wholesale prices of commodities in German and English currencies in mid-Aug. 1921, either the German prices would have had to show a 29-fold, and not a 16-fold, increase as compared with the pre-war level, or else the mark exchange would have had to stand at 180, instead of 320, marks to the £1; or, correspondingly, English prices would have to be lowered. The mark, however, actually depreciated still further in Sept. and Oct. 1921, reaching on Oct. 17 an exchange of 750 to the £1. The explanation of the relatively low prices (in sterling) of German commodities at this time was presumably to be found in the higher productivity of the German workman and his lower standard of living, though the situation was also being affected by the difference in the economic conditions generally. German wages, though increased nominally about 8-fold as compared with the pre-war standard, were now much lower than British. But the fact here noted with regard to the relationship between prices and currency in the international market was in 1921 some set-off to the mischief done to Germany by the depreciation of the mark. The low German exchange was, in itself, an advantage to Germany in respect of her export trade in competition with England in the international market, so far as the German capacity for exporting goods at all could be made effective, since it lowered the cost of German goods to the foreign purchaser. English manufacturers in the summer of 1921 were in fact complaining that they were undersold. On the other hand, the depreciation of the mark was a severe handicap to Germany in buying anything abroad, including the materials required for producing goods for sale in the international market.

was engaged in perfecting its powers for doing so. A new period of German financial and economic management had been entered upon; and a new period of world economics had also begun, —to what end a later generation would have to discover.

(A. F.*)

### The Republican Constitution

*1. From the Old Reich*[1] *to the New.*—The German constitution which arose out of the Prussian and German victories of 1866 and 1870 had culminated in three supreme organs—the Emperor (*Kaiser*), the Federal Council (*Bundesrat*), and the Reichstag (National Representative Assembly). Bismarck, by taking over into his constitution the democratic Parliament of the Frankfort *Paulskirche* (*see* 11.866) of 1848, linked that constitution with the democratic and national movement for unity which had continued to live in the mind of the German people since the Wars of Liberation against Napoleon, but which had not been able of its own strength to carry through the political transformation of Germany in accordance with its own ideas. Although Bismarck diverted this popular tendency into the paths of his own policy, he had not realized its aims. The Reichstag was linked up with the idea of 1848, but in the Federal Council the organ of the old Federation of Sovereigns survived. And this representation of the "Federated Governments" (*die Verbündeten Regierungen*) was, according to the terms of the constitution, endowed with greater plenitude of power than the representation of the people, the Reichstag. The status and the construction of the Federal Council prevented the emergence of an independent and politically responsible Government, and thus obstructed evolution towards the parliamentary system. On the other hand this situation made the dynasties and governments of the individual states feel their subordination to the hegemony of Prussia less keenly; they were able to regard this subordination as the inevitable premium which they had to pay for mutual insurance under the Prussian protection. Prussian hegemony in the federally organized Empire was the natural consequence of the fact that Prussia embraced in population and territory four-sevenths of the whole Empire, and that she possessed the strongest military and administrative organization. The constitution of the Empire gave outward expression to this fact by making the king of Prussia the German emperor. But the real basis of the political power of Prussia in the Empire, as in its other aspects, lay not in the emperor's prerogatives but in the position of the Prussian Crown. The old public law of Germany always regarded its conception of monarchy as realized solely in territorial sovereignty. It remained, therefore, in this instance an open question and a matter of controversy whether the German emperor could be correctly described as monarch of the Empire and whether imperial Germany could be described as a monarchy. The political unification of Germany had not in fact been accomplished as in Italy, through the supersession of the territorial sovereignties by a national monarchy. On the contrary, the old Federation of Sovereigns (*Fürstenbund*) had, after the expulsion of Austria, been more firmly compacted under the leadership of that member of the Federation which was now the strongest—Prussia; and it had been popularized and modernized by the addition of the Reichstag elected by the democratic suffrages of the whole nation.

No doubt, in the course of those succeeding decades which brought an apparently assured position of power to the Empire in its external aspects, together with a splendid growth of economic prosperity, there arose a natural tendency towards development in the sense of the modern national State. Under the influence of this tendency the centre of gravity of public life was more and more altered in favour of the Empire; the political influence of the Reichstag and the independence of the Government of the Empire were more and more strengthened. Nevertheless, this development never reached the point of giving distinct form and substance to the powers and responsibilities of a national Government. The extension of the political mentality of the people did not keep pace with that of its economic and social capacities; its political evolution could not overcome the tenacious resistance of the old powers and the obstruction of the old order of things. There remained an unsolved and apparently insoluble discord between the development that was necessary and the political dynamic forces that had been inherited, a conflict which was one of the deeper contributing causes of Germany's national disaster.

The military and political catastrophe with which the World War ended threatened likewise the internal political existence of the German people with a terrible twofold peril. Bitter disappointment and despair brought the complete dissolution of the national commonwealth appallingly near by producing the criminal delusion that single portions and fragments of a shattered Empire might be able to bear the dreadful consequences of defeat better than the nation as a whole in firm political unity. And at the same time the desperately bitter feeling of large sections of the people directed itself, in view of the collapse of all the old authorities, against the foundations of any and every order of the state and of society, which these sections, following the example of their neighbour, Russia, dreamed that they could overthrow by means of a world revolution and the dictatorship of the proletariat. The only salvation from these two deadly perils, which menaced the political and social existence of the German people and indeed of all Europe, was to be found, if anywhere, in the conception of a national democracy. This idea had lived through generations in the soul of the German people; it had survived failures and defeats, and it had only been relegated to the background by the successes of Bismarck's policy. What was now needed was to revive with resolute determination this idea of national German democracy. Not as a federation of sovereigns, nor as a federation of separate states (now without sovereigns) under Prussian hegemony, could the German Reich continue; it could only be perpetuated as a national commonwealth, the outward political expression of German national unity, by virtue of the sense of a common nationality and by democratic self-determination. The fundamental idea of German national democracy had therefore to be "*grossdeutsch*"[2] (greater German). The "*kleindeutsch*" (smaller German) imperial Reich had been built upon dynastic foundations, and had therefore been compelled to exclude the Germans of the Habsburg Monarchy from the empire of the Hohenzollerns. But once the empire of the Habsburgs had been shattered to pieces in the name of the principle of nationality, the national and democratic German Republic would necessarily have been abjuring that very principle and the idea on which it was itself based, if it had not kept the door open for the Austrian Germans to enter and unite with their common stock. And, further, as the democratic idea of national unity was the only thing that could be effectively opposed to national disintegration, so it was only with the idea of complete democratic equality of rights for all members of the nation that the destructive attempts to set up a lawless class despotism of the proletariat could be successfully encountered.

It was for Germany a piece of good fortune in the midst of bad that social democracy, which, after the collapse of the old authorities, had come to the top, should at this critical juncture have taken its stand upon the platform of political democracy and gradual social reform. The Social Democratic "Commissaries of the People"[3] promulgated the Electoral Law of Nov. 30 1918, which was drafted at their request by the Democratic Secretary of State for the Interior, Dr. Preuss. In accordance with the

[1] The words "*Deutsches Reich*" were, before the revolution of Nov. 1918, invariably translated "German Empire." But the word "Reich" has, for historical reasons, been retained by the German Republican Commonwealth as its official territorial and political designation. "Reich" is an old Germanic word found in various forms in Gothic and Middle English, and surviving in composition in the English word "bishopric."—(Ed. *E. B.*)

[2] The idea of Greater Germany, *i.e.* of Germany including German Austria, had been opposed since 1848 to the idea of "*kleindeutsch*," *i.e.* Germany, excluding Austria, which was adopted and carried out by Bismarck.

[3] The first Provisional Government by six "Commissaries of the People (*Volksbeauftragte*)" set up under Ebert and Haase after the revolution of Nov. 1918.

terms of that law a Constituent National Assembly (*Deutsche Verfassungsgebende Nationalversammlung*) was elected by all German men and women over 20 years of age, and the definitive decision with regard to the future constitution of Germany was entrusted to this democratic National Assembly. It met on Feb. 6 1919 at Weimar. The Secretary of State, now become Minister of the Interior, laid before it a draft of the new constitution of the Reich, which, it is true, had been strongly modified in a Particularist sense by the representatives of the Governments of the individual states in the States Committee. These modifications were, however, for the most part eliminated by the National Assembly and its Committee on the Constitution. On July 31 1919 the National Assembly adopted the new constitution of the Reich by 262 votes, cast by the Majority Socialists, the Centre (Catholics) and the Democrats, against a minority of 75, composed of the two parties of the Right and the party of the extreme Left. This Constitution of Weimar was promulgated by the president of the Reich on Aug. 11 1919, and thus came into force. The fact that the young German Republic had to pass under the terms of the Peace of Versailles simultaneously with the establishment of its constitution prejudicially affected the chances of the latter's becoming familiar to the popular mind, and compromised the new order of the State in a way that was fraught with mischief.

*2. Democracy and Reichstag.*—While the old constitution was headed by the statement of the fact that it had originated in a federation of sovereigns under the leadership of the King of Prussia, the new constitution is prefaced in deliberate contrast by the declaration of the national and democratic conception which guided its construction:—

> The German nation, united in its peoples (*Stämme*) and inspired by the determination to renew and to establish its Reich in freedom and justice, to promote peace at home and abroad, and to further social progress, has given itself this Constitution."

If Germany had possessed a national monarchy, there might perhaps, even after terrible defeat, have been a possibility of preserving it. But it was quite impossible, after the collapse of the 22 dynasties and their Prussian head, to entertain the idea of restoring monarchy. The maintenance of the political unity of the German people was only practicable in the form of a democratic republic. The new constitution, nevertheless, retained the designation of "Reich" for the national commonwealth, in spite of the danger of misapprehension which might arise from the connexion existing between the words *Reich* (Empire) and *Kaiser* (Emperor) in the French and English languages. In the soul of the German people the idea of its unity has for centuries been so intimately identified with the name "*Deutsches Reich*" that there could really be no thought of abolishing that designation at a moment when Germany's whole destiny depended upon the vivifying power of the national sense of unity. The German democratic republic is a Reich without an emperor and without sovereigns. This is expressed by the first article of the new constitution as follows:—

> The German Reich is a Republic. The powers of the State proceed from the people.

Linking itself with the traditions of the old German democracy which inspired the movement of 1848, yet at the same time clinging to the memory of the economic expansion of Germany during the last decades, Article 3 enacts:—

> The colours of the Reich are black, red and gold. The flag of the mercantile marine is black, white and red [1] with the colours of the Reich in the top inside corner.

While the constitution of the Reich is designed to realise at home the democratic State based on law, it takes its stand in its external aspects with deliberate emphasis upon the basis of international law, for Article 4 says;—

> The universally recognized rules of international law are accounted as binding constituent parts of the law of the German Reich.

The democratic principle is carried out by the constitution of the Reich in a twofold shape; first in the forms of representative democracy, the highest organs of the German Republic—the Reichstag and the Reichspräsident—being elected by the most extensive democratic franchise; secondly, in an institution of direct democracy—the referendum, which has been introduced alongside of the other and, according to the circumstances of the occasion, is exercised as the vote of the people (*Volksabstimmung*), the initiative or demand of the people (*Volksbegehren*) and the decision of the people (*Volksentscheid*).

The suffrage for the Reichstag was universal, equal and direct under the constitution of the Empire; the new constitution (Art. 22) has reduced the age for the exercise of the suffrage from 25 to 20; while for the "passive franchise," *i.e.* eligibility for the Reichstag, the lowest age limit of 25 has been retained in the Electoral Law of April 27 1920. The vote and likewise eligibility have been conferred upon women entirely on the same footing as upon men. The system of election by majority in single constituencies has been replaced by the proportional system with *scrutin de liste*. Finally, the election must take place on a Sunday or public holiday. These changes correspond to the demands which the Social Democrats had long ago put forward in regard to these points in their political programme.

There is the same franchise for the election of the president of the Reich as for the referendum. According to the Electoral Law now in force, which, however, will probably one day be altered, the whole territory of the Reich is divided into 35 electoral districts, each of which elects a large number of deputies on the system of strictly separate and closed lists. Thus the list is elected, not the single deputy. To every list as many seats are allotted as the number of times by which the number of votes cast for that list is divisible by 60,000. On this basis the candidates are elected in the order in which their names appear on their list. The total number of Reichstag deputies is accordingly not a fixed number; it is determined by the number of votes recorded at the election. The 35 electoral districts are combined into 17 groups of districts, and within the limits of each of these groups the parties may associate their lists in order to secure that remainders of votes under 60,000 may be reckoned conjointly. The further votes which still remain after this process throughout the whole Reich are credited to what is called the "*Reichsliste*" of the party for which they are cast, and a deputy is elected for every 60,000 of these remainder votes. A remainder which exceeds 30,000 votes is counted as 60,000. It follows that out of all the votes cast for any party throughout the whole Reich 30,000 at the utmost can be lost as regards their effect upon the result of the elections. In consequence of the extent of the suffrage, which is as wide as it can possibly be, 60% of the whole population of Germany now possess the franchise. The census of 1919 showed the population of Germany to be about 60,000,000. There are therefore close upon 37,000,000 persons in the German Reich who enjoy the franchise.

The old Reichstag itself used to decide disputed elections; but the decision was frequently long delayed, often indeed until the very end of a legislative period; and its impartiality was once and again doubtful. In point of fact, such decisions bore essentially the character of the exercise of a judicial function for which Parliament, swayed by political parties, is little fitted. Yet so long as a Parliament has not become absolutely sure of its power in the State, it is wont to watch over this right as over all its other prerogatives with jealous vigilance. Under the new order in Germany the Reichstag is now strong enough to dispense with this judicial function. For the investigation of disputed elections the new constitution of the Reich (Art. 31) transfers the decision to a court composed of judges and of members of the Reichstag. The mixed composition of the court was adopted in order that the deciding body might continue to have the benefit of expert parliamentary knowledge.

The Reichstag is elected for four years. The duration of the legislative period is a natural subject of conflict between democratic and parliamentary tendencies. Democratic tendencies are in favour of enabling the people, the electorate, to make its voice heard as frequently and as directly as possible, and it therefore urged that the duration of the representative assembly should be brief. On the other hand the efficiency of parliamentary

[1] The colours of the Hohenzollern Empire.

government depends upon allowing an adequate period to elapse between the travail and the after-pangs of a general election for Parliament to have time for quiet political work. The four-year legislative period adopted in the constitution of the Reich represents a compromise between the old legislative period of five years and the demands for a two or three years' period. From the point of view of reasonable parliamentary democracy a period of four years does not seem too long, especially as there is the referendum; and, moreover, the president of the Reich can, by dissolving the Reichstag, appeal from the elected to the electors. It is true that he can do this only once on account of the same matter (Art. 25). This limitation was introduced in order to prevent any attempt by an autocratic president and a complaisant Government to weary the people by repeated dissolutions and thus impose their will.

The date of the meeting of the Reichstag is not subject to the pleasure of the Government; it has the right to convoke itself. The first meeting of a newly elected Reichstag must take place at latest on the thirtieth day after the elections; otherwise it must assemble every year on the first Wednesday of November, unless its president, on the demand of the president of the Reich or of two-thirds of the deputies, convokes it earlier. The Reichstag itself determines the close of its session and the date of its reassembling (Art. 23, 24). In other respects, too, the Reichstag enjoys the fullest rights of parliamentary autonomy, which its president, elected by itself, officially safeguards. Its proceedings are public; it is only on a proposal backed by 50 members and on a resolution supported by a two-thirds majority that the publicity of the proceedings can be suspended (Art. 29). The press cannot be called to account so long as it gives accurate reports of the Reichstag's public proceedings (Art. 30). The parliamentary immunity of the deputies is secured in the most consistent fashion. This does not merely embrace inviolability of privilege for their votes and speeches in the House and their exemption from arrest or legal proceedings without the consent of the House; they have also the right to refuse to give evidence regarding persons or facts with which they become acquainted in their quality of deputies (Art. 36–38).

3. *The Reichstag and the President.*—According to the old constitution the assent of the Reichstag was, no doubt, required for laws, taxes and the budget; but its influence was decisive only in a negative sense; it could prevent things from being done, but it had no power of creative political action. Upon the composition of the Government and, therefore, upon the general tendency of its policy, the Reichstag had no constitutional influence. The political direction lay quite definitely with the federated governments represented in the Federal Council (*Bundesrat*), with the Prussian Crown at their head. The new constitution of the German Republic puts the Reichstag at the centre of the life of the State by establishing the parliamentary system of government on the broadest democratic foundations. This in no way signifies unlimited autocratic sovereignty of Parliament. On the contrary, the principle of the constitutional state, established on the basis of law, requires the co-existence of several supreme organs of the State between which parliamentary government forms the elastic link; and it requires the control of independent courts which can determine the legality of all private and public acts. In a parliamentary monarchy the hereditary crown is coördinate with the Houses of Parliament. In a republic an elected head of the State is substituted. If he is elected by Parliament his position is not coördinate with, but rather subordinate to, Parliament; he has no authority of equal standing with that of Parliament; and he is therefore unable in critical situations to supply any counterpoise to excessive manifestations of the one-sided domination of party. In a democracy the only element of equal standing and equal weight with the Parliament is a head of the State who is likewise elected by the whole people.

Accordingly, in the democratic German Republic the President of the Reich is elected by the whole German people.[1] He is elected for seven years. Every German who has completed his thirty-fifth year is eligible. A woman may be elected (Art. 41, 43, 109). The special Electoral Law of May 4 1920 enacts that all electors for the Reichstag have a vote for the president; that the suffrage is direct and secret; and that an absolute majority on the first ballot is decisive. Should there, however, be no absolute majority on the first ballot, then the result is decided in the second ballot by relative majority. The President of the Reich is thus as much a direct representative of the people as is the Reichstag; he is not dependent upon the Reichstag either for his original election or for his reëlection. It is true that the constitution gives the resolutions of the Reichstag the greater decisive force; but, in the case of the Reichstag, the representation of the people is distributed among more than 400 deputies, while in the case of the President of the Reich it is concentrated in a single person. The position of this "plebiscitary" president may present many of the features of a tribune of the people, but the danger of degeneration into Caesarism or Bonapartism is meant to be counteracted by the strict practice of the system of parliamentary government, which makes every act of the President absolutely and without exception conditional upon the coöperation and countersignature of the Ministry of the Reich, which, again, is dependent upon the Reichstag.

Unquestionably as a democratic republic was in the circumstances the only possible form of state for Germany, it might nevertheless have been open to serious doubt whether the parliamentary system of government was suitable for that country. This system, it is maintained, cannot with any prospect of success be imposed by rigid legal statutes. It is rather the organic product of a long political development, which can only be created by tradition, political training and by the self-control of political parties, without which parliamentary party government cannot politically subsist. This kind of tradition and the selection of steady leaders, which depends upon it and is indispensable for parliamentary government, are most naturally created where there is a development that has started from aristocratic parliamentarism, has progressively widened its bases, and, finally, through the plutocratic parliamentarism of the middle classes, leads to perfect democracy. In Germany historical development did not supply these favourable conditions. The political progress of that country lagged far behind its economic and social evolution. And now, by means of the new constitution, the parliamentary system and the most complete democratization, which had become inevitable, were simultaneously introduced, and that at a time when there was an entire lack of any leadership traditional and acknowledged by the free play of custom; at a moment, too, when the external situation was the most unfortunate conceivable; and when a very powerful social movement was asserting itself in the country. This is so; and yet what was necessary had also to be rendered possible in the midst of this decisive crisis of the destinies of the German people. For a people of 60 millions the organization of a pure, direct democracy could not be entertained. Suggestions were made from many quarters that, on the model of the American constitution, the executive power should be wholly entrusted to the president elected by the people, with a ministry dependent solely upon him and not upon Parliament. But this dualistic system, which lays excessive stress upon the separation of powers, has exhibited great imperfections when confronted with the demands of modern political life. The absence of a system of parliamentary government is, perhaps, the most serious defect in the otherwise admirable edifice of the American constitution. And Germany's own experiences of the unbridged dualism of Government and Parliament under the old régime offered no inducement to reëstablish it in a republican form. In spite of all the objections which have been mentioned, the new constitution had therefore to decide in favour of the parliamentary system in the confident hope that the practice of this system would itself gradually produce the political conditions requisite for its

[1] President Ebert was, however, elected by the National Constituent Assembly at Weimar. He was really provisional president, a definitive election not being considered expedient until the definitive extent of the German Reich had been decided, *e.g.* by the destiny of Upper Silesia.

success. This is the explanation of the circumstance that the constitution contains many express rules for the conduct of the parliamentary system, which in other countries is founded upon custom and convention, not upon written laws.

The Chancellor and, upon his suggestion, the Ministers of the Reich are appointed and dismissed by the President of the Reich. (Art. 53.)

In selecting the persons whom he might appoint, the President of the Reich is thus legally free, and is not confined, for instance, to the members of the Reichstag for his choice. But this is subject to precise conditions:—

The Chancellor and Ministers of the Reich require for the exercise of their office to possess the confidence of the Reichstag. Any and each of them must resign if the Reichstag by an express vote withdraws its confidence from him. (Art. 54.)

The Chancellor lays down the guiding lines of policy and bears the responsibility for them to the Reichstag. Within these lines every Minister of the Reich conducts the affairs of the department which has been entrusted to him independently and on his own responsibility to the Reichstag. (Art. 56.)

The President of the Reich can, therefore, only appoint a Government which is able to obtain the support of a majority of the Reichstag; and only so long as it commands such support can it remain in power. The Chancellor and the Ministers form a Cabinet (*Kollegium*), at the head of which the Chancellor of the Reich corresponds to the English Prime Minister.

The President of the Reich has in regard to foreign and internal affairs all the prerogatives which usually belong to the constitutional head of a State; but the declaration of war and the conclusion of peace are effected by legislation of the Reichstag; and political treaties concerned with matters which form the subjects of legislation require the approval of the Reichstag (Art. 45):—

All ordinances and dispositions of the President of the Reich, including those relating to the armed forces, require for their validity the counter-signature of the Chancellor or of the competent Minister of the Reich. By the counter-signature responsibility is assumed. (Art. 50.)

This likewise applies to the dissolution of the Reichstag and to the institution by the President of the Reich of a referendum of the people upon decisions of the Reichstag. If the Ministry, supported by a majority of the Reichstag, refuses its counter-signature to these acts, the President of the Reich can appoint another Ministry, and can, with the counter-signature of this Ministry, dissolve the Reichstag. The people finally decide the matter by the general election.

The constitution draws a sharp distinction between political and legal responsibility; the latter signifies responsibility for the lawfulness, the former for the expediency and the success, of the acts of the Government. Political responsibility is not a legal question which could be decided by a court of justice by means of legal proceedings in accordance with statute law; it involves a judgment regarding political values, which is materially influenced by the party point of view. Political responsibility is, therefore, enforced by a vote of no confidence on the part of the Reichstag, entailing the resignation of the Ministry or of a minister, but involving no judgment at law. As a general rule the political responsibility of the Ministry covers the President of the Reich. It is only for the exceptional case of an intolerable conflict between the President of the Reich and the Reichstag that, as the counterpart of the President's prerogative of dissolution, the Reichstag is similarly given the faculty of appealing from the elected to the electors. The Reichstag by a resolution, which must be carried by a two-thirds majority, can submit to the people a proposal for the deposition of the President. If this proposal be rejected by the popular vote, its rejection is taken to be equivalent to the re-election of the President for a fresh term of seven years, and it at the same time entails the dissolution of the Reichstag (Art. 43). Legal responsibility on the other hand is the same for the President of the Reich as for the Chancellor and the Ministers. On the proposal of at least 100 of its members the Reichstag can by a two-thirds majority impeach President, Chancellor or Ministers for having culpably violated the constitution or a law of the Reich. Judgment is given after regular proceedings at law by the Court for State Affairs (*Staatsgerichtshof*) for the German Reich, invested with the independence of a Supreme Court of Judicature (Art. 59).

*4. The Reich and the Territories.*[1]—Although the new constitution of the Reich did not originate, like the old one, in a federation of the separate states but in the national and democratic unity of the people, it has not abolished the existence of the separate states. Notwithstanding the more compact organization of the national commonwealth and a considerable extension of its competence, the smaller commonwealths continue, although they are no longer called "States" (*Staaten*) but "Territories" (*Länder*). Whether the German Republic should now be called a federation of States (*Bundesstaat*) with strong national central authority, or a unified State (*Einheitsstaat*) with strong territorial decentralization, is hardly more than a theoretical controversy about terminology. A great obstacle in the way of genuine federal organization and at the same time of consistent political and administrative decentralization is the manner in which territory is distributed among the different German countries. This distribution arose out of the accidents of the dynastic policy of the former reigning houses. It is in many instances a patchwork of fragments of territory which have no real connexion with each other; and above all there is a vast disparity in the size of the territories. Prussia alone embraces in territorial extent and population four-sevenths of the whole Reich; it is therefore by one-third as large again as all the other territories put together and some hundred of times larger than the smallest of them. Corresponding with this proportion was the position of hegemony which Prussia enjoyed under the old constitution of the Reich, but which has now been completely abolished in constitutional law. Yet this has not solved the difficulty of treating as equals territories which are actually so unequal, whether federative organization or the decentralization of the functions of the Reich be the question at issue. The necessity of giving the new constitution a proper basis by a territorial rearrangement of the component parts of the Reich has certainly been acknowledged; but under the pressure of perils without and within this right idea could not for the present be carried out. The 25 territories were therefore provisionally taken over in their old extent; and the constitution of the Reich merely prescribes the procedure by which a rearrangement may be effected at some future date. Meanwhile seven of the smallest territories have spontaneously combined to form the single new territory of Thüringen (Thuringia).

Within the organization of the Reich the individual territories are not represented, like the separate states of the American Union or like the Swiss cantons, by a separate House of Parliament, but only by a non-parliamentary body (*Kollegium*), the Council of the Reich (*Reichsrat*). The Reichstag consists of a single House. In the American Senate and in the Swiss Council of Estates (*Ständerat*) there are two representatives of each separate state, elected by that state but representing the political opinion of their party. Not so in the Reichsrat. That body is composed of members of the Governments of the different territories or of substitutes appointed by them, who speak and vote in the name of those Governments. In view of the vast disparity in the size of the different German territories it is impossible that each of them should have the same number of votes. Each territory has at least one vote and the larger territories several votes, in the main according to population. No territory, however, may have more than two-fifths of all the votes. Without this limitation Prussia alone would command a majority in the Reichsrat, so that the representation of the other territories would have no significance. Moreover, in future, half of the Prussian votes

[1] The different countries and cities federated in the German Empire (*Reich*) of 1871–1918 were called States (*Bundesstaaten*). In the constitution of the new republican Reich they (e.g. Bavaria, Württemberg, Saxony, etc.) are designated Territories (*Länder*), but also in their political aspects Free States (e.g. *Freistaat Sachsen, Bayern*, etc.).

are to be assigned to the provinces of Prussia, which thus for the first time will obtain direct representation in the Reich on the same footing as the other territories. At present there are 65 votes in the Council of the Reich; of these Prussia has 26, of which 13 are to be assigned to her 13 provinces, including Berlin as a province.

In composition and external aspect the Reichsrat is undeniably the successor of the old Federal Council (*Bundesrat*); but its real character and its constitutional position are essentially different. The Federal Council was the real seat of the authority of the Government and of the Prussian hegemony. Its President, the Imperial Chancellor, was at the same time Prussian Minister-President, and it was this that gave him real power; the direction of the Empire was very intimately connected with the Government of the Prussian State. In legislation the Federal Council had constitutional equal rights with the Reichstag, and as it likewise was in possession of the powers of Government, it actually predominated over the Reichstag. The Imperial Chancellor could not introduce any measure into the Reichstag without the assent of the Federal Council; and no measure or resolution passed by the Reichstag could come into force if the Federal Council did not agree to it. This position of the Federal Council had been the barrier against progress in the parliamentary system in imperial Germany, for it rendered impossible a Government really responsible to the Reichstag. In all these aspects the position of the Federal Council has now been so transformed that the path has been cleared in the German Republic for parliamentarism. The Reichsrat is presided over by a member of the Government of the Reich; but that Government is now entirely independent of the Prussian Government, and it is also independent of the Council of the Reich. It is not the Council but the Ministry of the Reich which conducts the Government and administration and issues general ordinances. Only in so far as the execution of the laws of the Reich falls within the competence of the authorities of the territories is the assent of the Reichsrat required for this purpose. For the rest, the Ministers of the Reich have to keep the Council informed regarding the conduct of the affairs of the Reich and to consult its committees in matters of importance. The Government of the Reich lays its bills in the first instance before the Reichsrat. If the Council rejects them, this does not bar the way to the Reichstag; the Government can introduce its bill together with an exposition of the dissentient views of the Council. The Council has the right to enter an objection to bills passed by the Reichstag; in that case the bill goes back to the Reichstag. If the Reichstag maintains its vote by a two-thirds majority the objection of the Council falls to the ground, unless the President of the Reich ordains that there shall be a popular referendum on the subject. If, however, the Reichstag only votes by a simple majority against the objection of the Council the bill is dropped, unless the President of the Reich institutes a referendum on the matter. The Reichsrat has thus a suspensory veto; the real seat of legislation is the Reichstag.

Neither the President nor the Government of the Reich possesses the right of veto on legislation; they must dispatch the laws which have been constitutionally enacted and must promulgate them within a month's time in the official Law Gazette of the Reich (*Reichsgesetzblatt*). The President can, however, submit a law passed by the Reichstag to the referendum within the month's period. Moreover, the promulgation of a law must be postponed for two months, if one-third of the members of the Reichstag demand this, and if the law has not been declared urgent by the Reichstag and the Reichsrat. If promulgation is postponed the law must be submitted to a referendum, if one-twentieth of the total electorate request it. The initiative in legislation is also admissible by way of the referendum; this is designated the popular demand (*Volksbegehren*). The popular demand must be based upon a fully drafted bill, the submission of which must have been demanded by one-tenth of the electorate. If such a demand has been brought forward the Government lays the bill, accompanied by an expression of its own opinion, before the Reichstag; if the Reichstag does not pass the bill without any alteration the final decision must be taken by a referendum. On the budget, on taxation bills and on votes for salaries the President alone can institute a referendum. Bills and resolutions passed by the Reichstag can be annulled by the referendum only if the majority of the whole electorate has participated in the popular vote. If it is a case of an alteration of the constitution for which a popular demand has been advanced, the assent of the majority of the whole electorate is requisite for the validity of the popular decision. For the rest, decisions of the Reichstag for alterations in the constitution can only be effected if two-thirds of the legally qualified members are present and if at least two-thirds of those present vote. Similarly in the Reichsrat laws for altering the constitution require a two-thirds majority. If the Reichstag has voted an alteration of the constitution to which the Reichsrat objects, the President of the Reich may only promulgate the alteration if the Reichsrat does not within a period of two weeks demand a referendum on the subject.

The referendum has hitherto been tried on a comparatively small scale only, as in Switzerland and in individual American states. On so large a scale and with a mass of some 37 millions of voters it will now, under the new constitution of the German Reich, be tried for the first time. This is an experiment which cannot be made without some misgivings; there are circumstances in which it might seriously complicate legislative procedure. In view of the situation in Germany, however, this modification of pure parliamentarism in favour of the direct intervention of democracy was necessary. The hope may be entertained that it will have the effect of promoting the political education of the masses; the precautions which have just been enumerated will at any rate militate against its abuse.

*5. Fundamental Rights.*—In the distribution of tasks between the Reich and the territories the new constitution like the old defines only the competence of the Reich, and tacitly leaves everything else to the competence of the territories. But the sphere of this competence of the Reich is materially broadened and more strictly outlined as compared with the old arrangements. The constitution of the Reich prescribes for all the German territories the republican form of government and popular representation based, like the Reichstag, upon equality of franchise; upon this representation the Government of the territory must lean. The same suffrage is also prescribed for the communal representative bodies.

In respect of legislation the competence of the Reich *ipso facto* excludes the competence of the territories for a variety of subjects, in particular for foreign relations, questions of citizenship[1] or nationality, freedom of migration within the Reich, emigration and immigration, extradition; similarly for the organization of the national forces and for coinage, customs, commerce, posts and telegraphs. For a very large number of other subjects the legislation of the Reich is also competent, but the territories also retain their competence as regards these subjects until the Reich exercises its prerogative. Besides this, the Reich can, in case of need, enact uniform laws dealing with public welfare and for the preservation of public order and security; and it can lay down principles for dealing with religious societies, schools, the legal status of officials, land laws, etc. In the matter of taxation the competence of the legislation of the Reich is almost unlimited. The law of the Reich prevails over the law of the territory—that is to say, territorial laws which contradict laws of the Reich are of no effect. In case of dispute the decision of the Supreme Court (*Reichsgericht*) may be invoked.

In administration, too, the direct competence of the Reich extends to the most important spheres, embracing foreign policy, military forces and navy, communications, especially posts, telegraphs, railways, inland navigation and waterways, customs and, for the most part, taxation as well. For the rest the laws of the Reich are executed by the administration of the territories, so far as these laws do not otherwise provide. Over this part

[1] A German is both a citizen of the Reich and of the German territory or state (*e.g.* Prussia or Bavaria) to which he belongs.

of the activity of the authorities of the territories, however, the Reich exercises supervision, and it can give these authorities general directions. In cases of difference a Supreme Court decides. If a territory does not fulfil the duties incumbent upon it according to the constitution or the laws of the Reich, the President of the Reich, with the aid of armed forces, can make it do so. Similarly, if in any part of the Reich public security and order are seriously disturbed or imperiled, the President can adopt the measures necessary for their restoration, and he can at the same time suspend certain of the fundamental rights. He must without delay inform the Reichstag of all these measures, and, if the Reichstag so demands, he must revoke them. In the spirit of the State based upon law the constitution of the Reich contemplates at all points the decision of disputed questions of justice by independent courts. It sets up the leading principles for securing this independence and for the judges' tenure of their office for life. It prohibits emergency courts, enacts the abolition of military jurisdiction and, on the other hand, secures the existence of courts of administration for the protection of the individual against ordinances of the administrative authorities. A Supreme Court of Administration (*Reichsverwaltungsgericht*) is to be established by a special law.

In addition to the part which specially deals with organization and is entitled "Construction and Duties of the Reich"—in fact the whole scheme of government—the constitution sets up as its second part a declaration of rights entitled "Fundamental Rights and Duties of Germans." These rights embrace partly statute rights which are directly applicable, but, for the most part, the declaration lays down guiding lines for a programme of legislation for the Reich and the separate territories. These, in a multitude of diverse provisions, have reference to the individual, life in communities, religion and religious societies, education and schools, and economic life. In contradistinction to earlier declarations of the rights of man and of the citizen they lay stress, not merely upon the preservation of individual liberty, but above all upon the obligations and the solidarity of society. Of special importance from the point of view of organization is Art. 165, which declares that the workers and salaried employees and their organizations are to be brought into coöperation on an equal footing with the employers in the arrangement of social and economic life. The declaration prescribes the formation of workers' industrial factory councils, of district economic councils, and of an Economic Council of the Reich (*Reichswirtschaftsrat*). Before the last-mentioned Council social and economic bills of fundamental importance must be laid by the Government of the Reich for its opinion. The Council can also itself propose such measures and can have them advocated by one of its members before the Reichstag. The constitution does not, however, give the Economic Council of the Reich a decisive vote; the Council is, therefore, not an actual organ of legislation.

*6. The Constitution of the Free State of Prussia.*—From the collapse of Nov. 1918 there did not emerge a common Revolutionary Government for the Reich and Prussia. Accordingly in Jan. 1919, eight days after the elections for the German National Assembly, a separate Prussian Constituent Assembly was likewise elected. After many difficulties and obstacles had been overcome this Assembly completed on Nov. 30 1920 the republican constitution of Prussia.

For Prussia the revolution had infinitely greater significance than for any other German state. In view of the distinctively monarchic structure of the old Prussian State the transition to a republic was in itself something that bore the aspect of a prodigy. This change at the same time brought with it the complete alteration of the position of Prussia in the Reich, a position which had hitherto been characterized by the imperial dignity (*Kaisertum*) attaching to the Prussian Crown. And not only was this hegemony, the close connexion of the Prussian Government with that of the Reich, abolished; important rights and instruments of power, as, in particular, military organization and railways, passed from Prussia to the Reich. Finally this brought about a further change in the other direction in the relationship between Prussia and her own provinces, which had till then been held together by the compact centralization of monarchy.

The contents of the Prussian constitution are determined and influenced in a far-reaching and decisive way by the new constitution of the Reich. The republican form of government, the basis of the suffrage for the election of the Landtag (the Prussian Diet or Legislative Assembly), and a Government supported by the confidence of the representatives of the people, were prescribed for the constitution of this territory by the law of the Reich. The new Prussian constitution merely carries out these instructions. But, in its close connexion with the constitution of the Reich, it designedly goes considerably further; for the majority of the Prussian Constituent Assembly desired to strengthen as much as possible the unity of the Reich. But for the sake of this object they had to deviate in one important particular from the pattern of the constitution of the Reich. If they had set up a president of the Prussian State in addition to the President of the Reich, friction of the most serious character would have been inevitable. The Prussian Republic has, therefore, no president. The Diet (*Landtag*) is elected on the same franchise as the Reichstag and, like it, for four years. It elects, without debate and by an absolute majority,[1] the Minister-President, who then appoints the rest of the Ministers. The Minister-President and the Ministry of the state hold a position as regards each other and as regards the Diet analogous to that of the Chancellor and the Ministers of the Reich as regards the Reichstag. Their political and legal responsibilities are regulated in the same way as in the Reich. The Staatsrat (State Council) holds a position in accordance with the Prussian constitution similar to that of the Reichsrat in the Reich.

So long as a new territorial arrangement of the territories (states) which compose the Reich cannot be carried out, the attempt is being made to diminish the difficulties arising from the disproportionate size of Prussia in comparison with the Reich by increasing the independence of the Prussian provinces by means of thoroughgoing decentralization and enabling them to enter upon direct relations with the Reich. This at the same time meets the popular desire in many districts of Prussia, which are hardly inferior in extent, in population and in cultural and economic importance, to any of the non-Prussian German territories, and are, indeed, superior to most of them in these respects. In the sense of this policy the constitution of the Reich has conferred half the Prussian votes in the Reichsrat to the Prussian provinces. In the same spirit the Prussian constitution prescribes a great extension of provincial autonomy, and has created the Staatsrat (State Council) to represent the provinces in the legislation and administration of the state. The Staatsrat is no more intended to be a second chamber than the Reichsrat; the Parliament consists of one House. But, as the Prussian provinces have no independent Governments of their own, the Staatsrat cannot, like the Reichsrat, be composed of the members of Governments. Its members are elected by the different provincial Diets, which, again, are the products of equal suffrage like the Reichstag and the Landtag. The procedure is that the members of the Staatsrat are elected on the proportional system immediately after every general election for the provincial Diets. They give their votes in the Staatsrat without instructions in accordance with their own unfettered convictions. Every province sends up at least three representatives and an additional one for every half-million inhabitants. All men and women who are citizens of the Reich, have completed their twenty-fifth year, and have been domiciled in the province for one year, are eligible. In the legislation of Prussia the Staatsrat plays a part analogous to that of the Reichsrat in the legislation of the Reich. If it raises objection to decisions of the Diet the objection can be set aside by a repetition of the vote of the Diet by a two-thirds majority or by a referendum which the Diet can institute. The assent of the Staatsrat is requisite if the Diet wishes to vote expenditure exceeding the amount

[1] A candidate, in order to be elected, must have received one more than half of the number of votes cast.

which has been proposed or approved by the Ministry. A referendum is not admissible in this instance. In the administration the Staatsrat coöperates by giving its opinion on the general ordinances which are to be issued by the Ministry. The President of the Staatsrat, elected by itself, is entitled to coöperate in the dissolution of the Diet, which, in the absence of a President of the State, is decided upon by a body (*Kollegium*) composed of the Minister-President, the President of the Diet and the President of the Staatsrat. The Landtag can also be dissolved by its own vote or by popular demand. For the rest the referendum, the popular demand and the popular decision are admissible in a form similar to, though somewhat more restricted than, that which is prescribed for the Reich.

It is only by a gradual and tranquil development that the immense transformations in every sphere of the State, which find expression in the constitution of the Reich and Prussia, can establish themselves and take firm root in the mind of the people, in which, naturally, traditions and memories of the past were still not obliterated in 1921. (H. P.*)

### Administration

The business of the German Reich is conducted by the Ministries of the Reich, consisting of departmental ministers and ministers without portfolio. The departmental Ministries are as follows: Foreign Affairs, Interior, Finances of the Reich, National Defence (*Reichswehr*), Justice, National Economy (*Reichswirtschaft*), Labour, Post Offices and Communications, Treasury, Food, Reconstruction.

In Prussia affairs are conducted by the Ministry of State, composed of Ministries of the Interior, Justice, Finance, Public Welfare, Commerce and Industry, Agriculture, Domains and Forests, Education and Public Worship (*Kultus-Ministerium*).

The Territory and Free State of Prussia is now divided into ten provinces: Brandenburg, Pomerania, Lower Silesia, Upper Silesia, Saxony, Schleswig-Holstein, Hanover, Westphalia, Rhein Province, Hesse-Nassau. The municipality of Greater Berlin, created by the law of April 27 1920, also ranks as a province, as does the border region (*Grenzmark*) of Posen and West Prussia, being the remainder of the two former Prussian provinces bearing those names which was left to Prussia by the Treaty of Versailles. A Prussian province is at once a Regional State Authority (*Staatsteil*) and a self-governing local authority.

According to the new Prussian constitution (Art. 72), the provinces are to be administered by their own administrative organs in accordance with the terms of an Autonomy Law which is to be enacted. This administration is concerned with (i.) matters falling within the administrative competency of the provinces, having been either assigned to them by legislation or voluntarily taken over by them; (ii.) delegated affairs, *i.e.* affairs of State which have been transferred to the provinces.

The State authorities of the provinces are the Chief President (*Oberregierungspräsident*) and the Provincial Council; the local authorities are the *Landeshauptmann* (in some regions known as the *Landesdirektor*), the Provincial Diet and the Provincial Delegation (*Provinzialausschuss*). The provinces are divided as territorial parts of the State into districts (*Regierungsbezirke*), at the head of which is the district president. The districts are divided into sub-districts (*Kreise*), which are of two kinds, urban and rural sub-districts (*Stadt- und Landkreise*). These form part of the State Government like the provinces, and are also independent, self-governing units. The constitutions of local government units, *i.e.* the provinces, the urban and the rural sub-districts, are determined by provincial and local statutes, which differ for different parts of the country. The electoral system, on the other hand, has been made uniform for the organs of local government by a law of Dec. 3 1920. The suffrage is the same as for the Reichstag, with proportional representation.

In the sub-districts the organs of administration are the *Landrat*, the *Kreistag* and the sub-district delegation (*Kreisausschuss*). A town with a population of more than 25,000 inhabitants may separate from the rural sub-districts to which it would otherwise belong and form an independent urban sub-district. Rural sub-districts are divided into communes (*Gemeinden*), which again are either urban or rural communes. The pre-war statutes as to the administration of urban and rural communes are still in force. The organs of State administration under the *Landrat* are the *Amtsvorsteher* (sub-district officials); the organs of the communal administration are the *Gemeindevorsteher* (communal officials). The larger landed estates constitute *Gutsbezirke*, the administrative organs of which are the *Gutsvorsteher*. In the towns there is a council of aldermen (burgomaster and aldermen) at the head of the administration, and there is likewise a council of elected municipal deputies. All these administrative organs are being reformed on uniform and modern lines. Greater Berlin has, by the law of April 27 1920, been made into a single urban community, consisting of 8 urban communes, 59 rural communes and 27 manorial communes (*Gutsbezirke*). This permanent organization replaced the union of Greater Berlin, which had been provisionally effected for certain special purposes.

The status of officials as regards the Reich is based on Art. 128–131 of the constitution. They are appointed for life except in cases where the contrary is provided by statute. In Prussia their position is regulated by the Prussian constitution (Art. 77–79). Every official of the Reich has to take an oath of fidelity to the constitution of the Reich, and every Prussian official to the constitutions of the Reich and of Prussia. The scale of salaries has been revised for the Reich by the laws of April 30 and Dec. 17 1920, for Prussia by the law of May 7 1920. According to the law of the Reich of Dec. 21 1920, the remunerations and allowances paid by the individual states, the local authorities or by other public corporations to their officials and the teachers in their schools must not be higher than the salaries paid to the officials of the Reich who occupy corresponding positions (*Beamtensperrgesetz*). In Prussia a maximum age limit has been introduced by the law of Dec. 15 1920. For officials directly employed by the State and for national-school teachers it is 65; for judges, teachers in universities and higher technical colleges, 68.

*Socialization.*—According to the new constitution of the Reich (Art. 156) the Reich may convert into property of the community all enterprises which are suitable for socialization. The Reich may associate itself, the individual states or the communes, with the administration of such enterprises, and it may out of separate industrial undertakings form self-governing coöperative bodies. The Socialization Law of March 23 1919 had been promulgated before the constitution was enacted. According to this law the Reich had the power (i.) to socialize all suitable enterprises, especially those occupied with the extraction of minerals and with the exploitation of natural sources of power;[1] (ii.) in case of urgent necessity to regulate by means of administration in the public interest the production and distribution of economic products. A Socialization Commission was set up whose business it is to make proposals for laws for carrying out the Socialization Law.

The rules for the working of the Statute of March 23 1919 dealing with the coal industry were promulgated Aug. 20 1919. At the head of the coal administration is the Coal Council of the Reich (*Reichskohlenrat*), under which is the Coal Association (*Reichskohlenverband*). The latter supervises the main lines laid down by the Coal Council for dealing with the whole industry in fuel. Germany is divided into 11 mining districts; all the collieries of each district are united into a syndicate. Similarly all gas-works in the district are united in one Gas Coke Syndicate. The Chancellor, and, under him, the coal commissaries of the Reich, exercise supervision over distribution of all the coal which is produced in Germany.

The potash industry is regulated by the law of the Reich of April 24 1919. The chief control is in the hands of the Potash Council. This body is competent to give its assent to the conclusion of syndicate contracts and to business regulations for the potash industry. It may forbid the opening of new potash-fields and may close down existing works. It fixes the price at which potash may be sold in Germany and also the average wage to be paid in the industry. Wage bureaux of first and second instance have been instituted for the latter purposes. All producers of potash are united in one obligatory syndicate, which has the sole right to sell and to import potash products. The potash control office supervises the execution of the instructions of the Potash Council of the Reich. It fixes the extent to which each of the potash-works is to participate in the general production. An application for revision of its decisions may be made to the Potash Board of Appeal.

Socialization of electricity has been initiated by the law of Dec. 31 1919. Associations are to be formed for the production and distribution of electrical power in all districts where there are electrical works. In the case of larger works the Reich has the right to take them over.

*Settlement and Housing.*—By the Settlement Law of Aug. 8 1919 the individual states are obliged to establish settlement associations in the public interest for the creation of small independent settlements. These associations have the right of preëmption for all properties over 25 hectares in extent unless they pass into the possession of a husband or wife or near relations of the owner. In settlement districts where more than 10% of the agricultural land is in properties exceeding 100 hectares in extent the properties form a land supply association with coöperative rights. This association

[1] A great development of water-power was in progress in 1921, especially in Bavaria.

has to place at the disposal of a settlement association lands for settlement up to one-third of the agricultural area as it existed in 1907 on the properties concerned.

According to the Small Holdings Law of May 10 1920 the Reich, the individual states and the communes may assign small holdings for the erection of dwelling-houses and for cultivation by a small holder. The holding may not be partitioned or mortgaged without permission of the authority which has assigned it. The assigning authority has the first right to purchase, except where property passes to a husband or wife or near relation of the owner, and it also has a claim to the reversion of the holding if the small holder manages the place badly or does not properly look after it.

The housing difficulty has since 1918 necessitated measures of compulsion. In accordance with the proclamation of Sept. 9 1920 the communes may prohibit the demolition of buildings and the use of living-rooms for purposes other than habitation; they may also demand the notification of rooms which are not in use. In districts where there is an actual housing crisis the commune can also be empowered to issue further regulations for such purposes as sequestration of houses and rooms for compulsory billeting. Profiteering by house agencies is forbidden and is punishable. For increases of rent a certain percentage in addition to the peace-time rent of July 1 1914 may be fixed as a maximum.

*Courts of Law.*—The principal courts of justice in their order from the lowest to the highest are: the Local Courts (*Amtsgerichte*), Provincial Courts (*Landgerichte*), Superior Provincial Courts (*Oberlandesgerichte*) and the *Reichsgericht* at Leipzig. The Reichsgericht is the only court which is maintained by the Reich; all the others are courts of the individual states. The judgments of the courts are issued in accordance with the new constitution of the Reich, under the heading "In the Name of the People."[1] All the courts act as civil courts, as criminal courts and as courts having jurisdiction in non-contentious matters.

The Amtsgerichte are, according to the Statute of March 11 1921, declared to be competent in all actions involving values up to 3,000 marks, and as regards some classes of actions (such as claims for maintenance, purchase of cattle, suits relating to rents and transport, etc.) without regard to the value of the object. The *Amtsrichter* sits as sole judge. An appeal from his judgment to the Landgericht may be made, but only when the value of the object is more than 300 marks.

The Landgericht sits in divisions consisting of 3 judges in civil actions and of 5 judges in the case of the more important criminal trials. In the more important districts the Landgericht has also a commercial division with one professional judge and two lay judges taken from the commercial classes. From a judgment of a civil or commercial division an appeal lies to the Oberlandesgericht, sitting in senates of which each is composed of 5 judges. From the judgment of this court there is again an appeal on pure questions of law to the Reichsgericht, sitting in senates of which each is composed of 7 judges; such appeals only lie where the value of the object exceeds 4,000 marks, or in special classes of action (*e.g.* matrimonial suits, claims against the State, etc.).

Minor criminal cases are tried by the courts of first instance, *Schöffengerichte*, which are presided over by the Amtsrichter and are composed of him and two lay judges. From the judgment of the Amtsgericht an appeal lies to a *Strafkammer* (Criminal Division of the Landgericht), and on points of pure law there is a further appeal to a criminal division of the Oberlandesgericht, in which 5 professional judges sit. Criminal cases of medium gravity are tried before a Strafkammer of the Landgericht as a court of first instance. An appeal lies from its judgment, not on questions of fact but only on the ground of misapplication of the law, in most cases to the Reichsgericht at Leipzig, but in some classes of cases this appeal goes to the Oberlandesgericht.

The gravest crimes are tried before a court composed of 3 judges sitting with a jury; the jury consists, as in England, of 12 persons. There is an appeal to the Reichsgericht against the judgment of a court sitting with a jury, but only on the ground of faulty procedure.

The Reichsgericht at Leipzig, in addition to being the court of revision in civil and criminal matters, is also competent, as a court of first and final instance, for the trial of cases of high treason, ordinary treason and military crimes. In order to obviate the extradition of the Germans accused of war crimes (as provided for in Art. 228 *seq.* of the Treaty of Versailles), the Reichsgericht was declared by a Law of Dec. 18 1919 to be competent for the trial of war crimes and offences.

Amtsgerichte, Landgerichte, Oberlandesgerichte and the Reichsgericht are designated as regular (*Ordentliche*) courts. There are, in addition, special courts (*Sondergerichte*); for example, industrial and commercial courts for disputes between employers and employed. In these there is a permanent president with assessors consisting of employers and employed in equal numbers. There are courts dealing with profiteering (Ordinance of Nov. 27 1919). There is further the *Reichswirtschaftgericht* (Ordinance of May 11 1920), or economic court of the Reich for dealing with certain kinds of disputes arising out of the war and the conclusion of peace. Other special courts are the extraordinary tribunals with expedited procedure, such as those which the President of the Reich, acting by virtue of emergency powers conferred on him in Art. 48 of the constitution, set up to deal with cases arising out of the communist disorders. These courts are presided over by 3 professional judges; there is no appeal.

*Legislation for Carrying Out the Treaty of Versailles.*—The Peace of Versailles was signed on June 28 1919, and accepted by the Reichstag by the Law of July 16 1919. According to the concluding article of the Treaty it was to come into force so soon as Germany and the three leading Powers had ratified it, and a "First Protocol" regarding the deposition of the Acts of Ratification had been drawn up. This was done on Jan. 10 1920. That day is, therefore, to be regarded as the day of the conclusion of peace for Germany in her relations with those States which had at once signed this protocol.

Germany had previously promulgated two laws of Aug. 31 1919: a law for the execution of the Treaty of Peace, and an Expropriation Law for the purposes of the Peace Treaty. According to the former, the settlement of claims and debts arising from transactions entered upon before the war between Germans and enemy nationals could as a rule be effected only by means of official investigation and through clearing offices (Treaty of Peace, Art. 72, 296); but where an enemy Power had not, according to Art. 296*e*, given notice to Germany, within a month's time after its ratification of the Treaty, of its intention to adopt the clearing-office system, direct negotiations were permitted. On April 24 1920 a statute was formed setting up a central clearing office of the Reich in Berlin, with 15 branch offices in the more important towns.

Up to May 1 1920 the following States had declared their participation in the clearing-house system: Great Britain, France, Italy, Belgium, Siam, Haiti. The following States had so far decided for direct negotiations: Brazil, Japan, Bolivia, Guatemala, Peru, Poland, Czechoslovakia, Uruguay, the British Union of South Africa and the British Protectorate of Egypt, Yugoslavia, Cuba, Portugal, Liberia, Rumania, Honduras, Nicaragua, Panama.

The law for executing the Treaty further authorised the Government of the Reich to requisition, subject to compensation, the service of agricultural, forest, industrial and mercantile enterprises, for the purpose of fulfilling the obligations arising out of the Treaty.

The Expropriation Law of Aug. 31 1919 empowered the Reich to confiscate and expropriate provisionally by summary order without legal procedure objects which were to be transferred to the Entente.

For the execution of the Peace Treaty a special commissariat of the Reich for works of reconstruction was instituted in the Ministry for Reconstruction, and also a commission for restoring machines and material to the enemy. According to the Law of the Reich of May 3 1920 information must be given to the authorities regarding all property rights and interests of German nationals in the territories of the Entente States.

Compensation for services and supplies to the enemy forces in occupied regions was provided for by the Law of March 3 1920.

*Military and Naval System.*—By the new constitution of the Reich, and under pressure of the Treaty of Peace, the military system of the German Reich was completely transformed. According to Art. 173 of the Treaty of Versailles universal service was abolished in Germany, and the German army might be recruited and vacancies filled solely by voluntary enlistment. According to Art. 160 and 183 of the Treaty, the whole peace strength of the German army might not exceed 100,000 men, while that of the naval forces was limited to 15,000 men—in both cases including officers. In execution of these provisions the Law "for the abolition of universal service and for the regulation of the obligation to serve for a long period" was promulgated on Aug. 21 1920. A provisional *Reichswehr* (army of the Reich and navy of the Reich) had at first been created by the laws of March 6 and April 16 1919; the Reichswehr Law of March 23 1921 was issued, and according to this law the armed force of the German Republic is the Reichswehr.

Those who enter the army or navy as soldiers or sailors undertake the obligation of serving for 12 years. After that period, unless three months' notice to leave is given, the contract is prolonged for an additional year. During the period of service either party may dissolve the contract on special grounds. Every member of the army or navy can be promoted to the highest posts in accordance with capacities and services.

The career of an officer is intended to be for life. A candidate, before he is appointed to the position, has to contract a written obligation to serve uninterruptedly for 25 years. This contract, however, like that of the men, can be annulled on special grounds before it expires. The electoral rights of officers and men as citizens remain in abeyance during their period of service (Electoral Law of the Reich of May 27 1920, §2).

Provision is made by law for soldiers who have left the service and for the surviving dependents of soldiers and sailors. Provision for those officers of the former German army and those non-commissioned officers under contract to serve for a long period (*Kapitulanten*), who were not taken over into the new army of the Reich, was made by the Officers' Compensation Law and the Non-commissioned Officers' (under contract) Law, both promulgated on Sept. 13 1919. Officers of the different reserves, the men, and the military officials (*i.e.* those belonging to the Reserve, the *Landwehr* and the *Landsturm*) were released from all military obligation by an order

[1] In the monarchical states the heading was "In the name of the King" or of the Grand Duke, Duke or other Sovereign.

nance of the President of the Reich and the Reichswehr Ministry dated Jan. 21 1920. The settlement of the amount of pension or provision to which they might be able to lay claim was reserved.

In accordance with the new constitution of the Reich (Art. 105) the former Military Courts of Honour were abolished, as was the whole system of military jurisdiction, apart from penal proceedings in time of war and on warships in commission. Apart from these courts-martial on land in time of war and in general on sea, criminal cases against members of the army and navy can be tried by the civil courts.

A law of the Reich of May 12 1920 deals with provision for former members of the German forces on land and sea, and with surviving dependents of such in cases where injury or death was incurred in the service. This law applies to claims for pensions or payments arising out of the war. The provision which is made, apart from medical treatment and social aid by means of gratuitous training in a trade or occupation, usually consists in a pension (*Rente*), the amount of which is regulated in accordance with the disability of the recipient to pursue his calling, and in accordance with the nature of his occupation, the numbers of his family and the place of his residence. The pension for surviving dependents in case of the death of a member of the army or navy in consequence of injuries received on service takes the form of a pension for widows, orphans and parents. Persons who are entitled to receive support may obtain instead of a pension a capital sum for the purchase of land, or for the economic amelioration of land which is their property.

In execution of Art. 173 *seq.* of the Treaty of Versailles the disarmament of the German population was undertaken in accordance with the Disarmament Law of Aug. 7 1920,[1] under the direction of a commissary of the Reich with an advisory council of 15 members chosen by the Reichstag. By the Law of the Reich for executing Art. 177 and 178 of the Peace Treaty participation in unauthorized military associations was made punishable by a fine not exceeding 50,000 marks, or by incarceration in a fortress or imprisonment for a period not exceeding 3 months.

According to Art. 228 of the Treaty of Peace the Powers of the Entente were entitled to bring before their military courts Germans who were accused of offences against the law and customs of war, and the German Government had undertaken to extradite all Germans demanded by the Entente and described as war criminals—an undertaking which was contrary to an express prohibition in the German penal code. The Entente ultimately intimated its assent to the arrangement that the German nationals whom it accused of these offences should be tried by German courts.

For the purpose of carrying out this arrangement a special law was promulgated on Dec. 18 1919 (amended March 24 1920 and May 12 1921). This law declared the Reichsgericht at Leipzig to be competent for trying and judging, as a court of sole instance, cases of crimes or offences against enemy nationals or enemy property committed by Germans at home or abroad up to June 28 1919, and punishable according to the law of the place where they were committed. Amnesties, proscription by lapse of time or the pronouncement of judgment at a previous trial formed, according to these laws, no bar to a new prosecution. Proceedings were to be instituted by the *Oberreichsanwalt* (chief public prosecutor) before the Supreme Court of the Reich; but even when that court found no ground for an indictment, the public prosecutor could demand that the decision should be given in open court after pleadings as to whether the proceedings were to be stayed or continued.

*Railways.*—During the war the Reichstag proposed that preparations should be made for bringing all German railways of any importance into the possession of the Empire. The Governments of the separate states resisted this scheme; they endeavoured by mutual arrangements (the so-called Heidelberg programme) to remove the chief causes of complaint arising out of the coexistence of so many railway systems. When the constitution of the new republican Reich was under consideration the unification of the railway system was assumed to be the aim in view. Art. 89 of the constitution of Aug. 11 1919 enacts that "it is the business of the Reich to acquire possession of the railways which subserve general traffic and to administer them as a unified system of communications." According to Art. 171 the railways of the German states were to be transferred to the possession of the Reich by April 1 1921 at latest. This transfer was actually effected on April 1 1920. In accordance with the treaty of March 31 1920, between the Government of the Reich on the one part and the states which owned the state railways—Prussia, Bavaria, Saxony, Württemberg, Baden, Hesse, Mecklenburg-Schwerin, Oldenburg—on the other, the railways of the states which were parties to it passed as a whole, with everything connected with them and all rights and obligations involved, into the possession of the Reich. The Reich indemnifies each state in one of two ways according to the option of the particular state. It either hands over the amount of capital invested in the railways of the state calculated on March 31 1920, or it pays the amount calculated to be the average between that amount and the capital value computed on the basis of the returns for the financial years 1909–13. In addition, the states are compensated in all cases for deficits which arose between April 1 1914 and March 31 1920, during the war and the period of the revolution. The total indemnification will burden the Reich with some 40 milliard marks. The Reich thus took over (according to the situation on March 31 1919) the following kilometric extent of state railways including narrow-gauge lines: Prussia and Hesse, 40,312; Bavaria, 8,545; Saxony, 3,367; Württemberg, 2,153; Baden, 1,859; Mecklenburg-Schwerin, 1,095; Oldenburg, 673 km. The total number of persons employed on the German state railways in 1920 was 1,030,000, including some 365,000 officials.

The Treaty of Versailles inflicted a heavy blow upon the German railway system; according to Art. 67 the German state railways of Alsace-Lorraine passed into the possession of France without any payment, whereas when Germany took possession of Alsace-Lorraine under the Peace of Frankfort (1871) the then French railway lines in those provinces were paid for by the German Empire with a sum of 250,000,000 francs. According to Art. 40 of the Treaty, Germany had further to renounce all her rights with regard to the working of railways in Luxemburg (the Wilhelm-Luxemburg railway). According to Art. 256 the state railways in the ceded portions of German territory passed into the possession of the states which acquired these territories; these states have, however, to pay the value of the railways as ascertained by the Reparations Commissions.

The whole organization of the railway system is under the Ministry of Communications. Subject to that Ministry the rights hitherto exercised by the Prussian Ministry of Public Works, the Prusso-Hessian central office, and the railway central office in Berlin, as well as the Bavarian central office in Munich, were maintained. The authorities for regional administration are the regional railway officials of management (*Eisenbahndirektionen*), and, subject to them, for local administration the offices for traffic, construction, machines and workshops.

*Postal, Telegraph and Telephone System.*—The unification of the whole German postal system, and its transference to the Reich, was effected by the terms of the new constitution of the Reich of Aug. 11 1919. Art. 88 provides that the posts and telegraphs, together with the telephone system, are exclusively the concern of the Reich. According to Art. 170 the posts and telegraphs administrations of Bavaria and Württemberg were to pass to the Reich on April 1 1921 at latest. The transfer, however, took place on April 1 1920, in accordance with a law of the Reich and treaties which had been previously concluded. Bavaria received an indemnification of 620,000,000 marks and Württemberg 250,000,000 marks.

The secrecy of the posts, telegraphs and telephone is safeguarded by Art. 117 of the new constitution of the Reich. The German post-office, in addition to conveying letters and parcels, conducts business in the nature of banking, such as the issue of postal orders, the collection of the price of goods on delivery or by means of postal mandates, and all payments resulting from the national insurance schemes (excepting sick pay). The post-office also performs the functions of a public recording official. It procures acceptances of bills, serves process in civil and criminal cases, collects and protests bills and cheques in case of dishonour; but its functions respecting bills and cheques do not extend to sums above 1,000 marks. Certain franking privileges which had previously existed were abolished by a law of April 29 1920. Postal tariffs have in many respects been increased by a law of March 22 1921. The postal cheque system is based upon the Postal Cheque Law of March 22 1921 and the postal cheque regulations of April 7 1921. In 1918 there were 300,562 persons who used postal cheques to the amount of 1·2 milliard marks. The whole turnover of the post-office amounted to 151 milliard marks, of which 115·5 milliards were paid without the use of currency. The administration of the telegraphs and telephone is under the supreme control of the Ministry of Posts for the Reich, subject to whom are 45 higher post directories for district administration, and under the latter are post-offices of the first, second and third class, railway post-offices and postal agencies.

*Waterways.*—According to Art. 97 of the new constitution it is the business of the Reich to take over into its own possession and administration the waterways which subserve general traffic. The waterways and sea-marks were transferred to the Reich on April 1 1921 in accordance with Art. 171 of the constitution. The keenly debated scheme for a Prussian central canal for establishing a connexion by water between the Vistula, the Elbe, the Weser and the Rhine, has been extended by laws of Dec. 4 1920 and Jan. 14 1921, sanctioning further expenditure of 436,000,000 and 740,000,000 marks (Weser and Elbe canal). The administration of the waterways by the Reich is conducted through the section for waterways in the Ministry of Communications.

By Art. 331 of the Treaty of Versailles the sovereignty of the State over the five great rivers—the Rhine, the Elbe, the Oder, the Memel and the Danube—which flow through German territory, has been considerably restricted. They are "internationalized."

*Air Traffic.*—By an order of the Council of the Commissaries of the People of Nov. 26 1918, an air-traffic office of the Reich was instituted in connexion with the Ministry of the Interior until a law should be issued for the regulation of air traffic. An ordinance for the provisional regulation of air traffic was issued on April 30 1920;

[1] Another law was passed in March 1921 for the disarmament and dissolution of forces like the Bavarian *Einwohnerwehr* and *Orgesch* (*Organisation Escherich*), the object of which was to organize various voluntary service formations throughout the country.

dirigible aircraft travelling outside the boundaries of an aircraft station without a licence for themselves and their pilots from the Office of the Reich for Air and Motor Craft may be declared confiscated by the Reich. (E. H.)

### The Post-War Army

In the chaos which followed the signing of the Armistice of Nov. 11 1918, the 228 divisions which then constituted the German army as known during the World War (*see* Army) either demobilized themselves or placed their services at the disposal of the more popular officers. In this way, the German Government was able to raise troops to oppose the Poles and to put down the Spartacist rising in Jan. 1919. The forces raised at first consisted of the following two categories:—(i.) In the E., volunteer formations were raised for "*Grenzschutz Ost*" (frontier guard E.) in addition to the retention with the colours of the 4 youngest classes. (ii.) In the interior, the 1918 class and men of old army units who had no civil employment were combined into so-called *Sicherheitstruppen* formed from the old army units. In addition certain volunteer units of pronounced republican tendency were raised in Berlin.

The forces named under (ii.) proved so untrustworthy that the Government had to fall back on volunteer formations, which were raised during Jan. and Feb. 1919 by the personal exertions of well-known officers of the old army. These volunteer formations, differing largely in military value, organization, methods of pay and recruiting, could only be regarded as a stop-gap, and in March the *Reichswehrminister* Noske obtained the consent of the National Assembly to the formation of a provisional *Reichswehr*, with linked *Volkswehr* units to be raised from the existing volunteer formations in the interior. The scheme for this new provisional army was promulgated in army orders of April 4, and was put into execution throughout the interior of Germany during April and May. The original scheme provided for 6 brigades on the higher and 12 on the lower establishment, giving a total of 177,000 men of the Reichswehr and linked Volkswehr in the interior; the main body of this force was organized from the volunteer formations stationed around Berlin under Gen. von Lüttwitz and formed the Lüttwitz Group.

The Sicherheitstruppen in the interior were disbanded or absorbed into the Reichswehr, and the remaining men of the younger classes were demobilized. Pay and organization of the various volunteer units and formations were regularized; gradually the scattered volunteer units and formations were transformed into Reichswehr brigades, and the former system of independent recruiting by units or commanders was transferred to the territorial army-corps districts.

The troops of Grenzschutz Ost, who were commanded by Hindenburg, were at first not affected by this new reorganization, but from mid-May 1919 the volunteer formations in Grenzschutz Ost were gradually absorbed into the Reichswehr. All men of the younger classes retained compulsorily in Grenzschutz Ost were discharged by July 31 1919. By Sept. 1919 the German Reichswehr consisted of 43 mixed Reichswehr brigades. In addition, there were still some volunteer formations in the eastern provinces. The total strength was then about 320,000 men. After the ratification of the Peace Treaty on Jan. 10 1920, the period allowed for the reduction of the Reichswehr to 200,000 men was 3 months. Up to the time of the Spa Conference (June 21 1920), however, the German army still considerably exceeded this figure. By the terms of the agreement at Spa, Germany was obliged to reduce the Reichswehr to 150,000 men by Oct. 1 1920 and to 100,000 men by Jan. 1 1921.

Although the German forces were reduced to the figures laid down in the Peace Treaty, with a few minor exceptions, by Jan. 1 1921, it was not until March 23 1921 that the law known as "*Wehrgesetz*" was promulgated by the Federal President, abolishing universal military service in Germany and definitely fixing the establishment of the new German army. By the terms of the new German Military Law the defence force (*Wehrmacht*) of the German Republic is the Reichswehr. It consists of the *Reichsheer* and the *Reichsmarine*, which are composed of, and recruited from, volunteer soldiers and non-combatant military *Beamten* (officials).

The army (Reichsheer) consists of 100,000 men, including 4,000 officers and military officials of officer's rank. In addition to these there are 300 medical and 200 veterinary officers. The Federal President is the commander-in-chief of the Reichsheer. The administration of the Reichsheer is exercised by the parliamentary *Reichswehrminister*, assisted by the Reichswehr Ministry. The total number of officers employed in the Reichswehr Ministry in accordance with the Treaty of Versailles must not exceed 300. Under the Reichswehrminister the executive military command is exercised by a general, who is chief of the army command (*Chef der Heeresleitung*), a title for which there is no British equivalent,[1] and the military administration is carried out by the chief of the army command, corresponding practically to the quartermaster-general of the British army system. The quartermaster-general ranks as Under-Secretary of State. The executive military command is carried out through two *Gruppen Kommandos* (Command Staffs) who are directly responsible to the chief of the army command. The administrative services of the divisions, however, are under the control of the Q.M.G. Each State of the German Federation may choose a *Landeskommandant* from amongst the commanders available in the State. The Landeskommandant is then confirmed in his position by the Federal President and is directly under the Reichswehrminister. The principal mission of the Landeskommandant is liaison between the Federal States and the Reichswehr Ministry. The German Reich is subdivided into 7 divisional districts. Each divisional district comprises 2 or more of the former army-corps districts. Each infantry division is commanded by a general officer, assisted by the commander of the infantry (*Inf. Führer*) and by the commander of the artillery (*Art. Führer*) and their staffs.

The composition of each infantry division is as follows:—headquarters; infantry H.Q. and 3 regiments of infantry; artillery H.Q. and one regiment of artillery; and, as divisional troops, one squadron of cavalry, one battalion of pioneers, one signal detachment (2 companies), one mechanical transport detachment (3 companies), one horse-transport detachment (4 companies), and one medical.

There are 3 infantry regiments in each division. Infantry regiments are numbered from 1 to 21, and are each composed of 3 battalions, one trench-mortar company, one depot battalion. The battalion has 3 infantry companies and one machine-gun company.

There is one artillery regiment in each division. Artillery regiments are numbered from 1 to 7, and consist each of 3 groups (of 3 batteries each). The pioneer battalion is composed of 2 pioneer companies, one pontoon detachment and one searchlight section.

Each cavalry division is commanded by a general officer, assisted by a divisional staff; the composition of the cavalry division is 6 cavalry regiments and one horse-artillery group (3 batteries). The cavalry regiment consists of 4 squadrons and one depot squadron. Cavalry regiments are numbered 1 to 18.

The divisional troops in each branch are numbered from 1 to 7 according to the division to which they belong.

*Armaments and Equipment.*—According to the conditions of the Treaty of Versailles and subsequent decisions by the Commission of Control in Berlin, the following scale of arms was authorized for the Reichsheer: Rifles (1898 pattern), 156,080; carbines, 18,000; short pistols, 50,000; machine-guns (light), 1,418; machine-guns (heavy), 828; field guns, 7·7-cm., 204; light field howitzers, 10·5-cm., 84. An arsenal reserve of 4% on the above figures was allowed by the Peace Treaty.

*Military Schools.*—According to the Treaty of Versailles the Reichsheer is allowed to maintain one military school per arm. These schools were in 1921 located as follows:—Infantry, Munich; Cavalry, Hanover; Artillery, Jüterbog; Pioneers, Munich; Farriers, Hanover. Physical training and sports receive special attention and encouragement in the Reichsheer.

The uniform of the Reichsheer is the standard field-grey uniform. The tunic is universal; breeches are worn by the infantry with ankle boots and puttees, and by mounted troops with knee boots. The head-dress is, for field service, a steel helmet or a grey field-service cap with cloth cockade and soft peak; otherwise a stiff service cap with cockade of the Reich surrounded by a wreath of oak leaves, above which is placed a cockade of the state to which the unit belongs. (The helmet and shako of the imperial army have been abolished.) The colour of the piping on the collar of the tunic and on the cap and the colour of the piping and of the numerals on the shoulder strap denote the arm to which the individual belongs:—infantry, white; cavalry, yellow; artillery, red; pioneers, black; signal troops, brown; trains, light blue. The former badges of rank of the imperial army, worn on the shoulder straps, have been restored to the officers of the Reichsheer, but the latter are now of dull and silver lace for junior officers, of intertwined gold and silver for field officers, and of gold lace for general officers. (X.)

### The Navy

The German navy law of 1900 proposed that the navy should consist of:—(1) the battle fleet, composed of 2 fleet flagships, 4 squadrons of 8 battleships each, 5 armoured cruisers, 24 light cruisers; (2) ships for foreign waters, comprising 3 armoured cruisers, 10 light cruisers; (3) and, as reserve ships, 4 battleships, 3 armoured cruisers, 4 light cruisers. Torpedo-boats and vessels for special purposes were to be added to the establishment year by year as necessity should arise. The Reichstag passed the law, except for the omission of the ships for foreign waters. During the succeeding years, in compliance with this programme, new ships were constructed, obsolete types replaced, dockyards, harbours and coast defences built, the Kiel canal widened and deepened, the personnel increased, the organization of the higher commands extended, etc. The Navy Law was afterwards supplemented as regards particular points, to meet the requirements

[1] The term "general staff," under the conditions of the Peace Treaty, is abolished. Practically, the chief of the army command exercises the functions of the former chief of the general staff.

of new developments. In 1906 the 6 armoured cruisers which had been cut out were reinstated, and, following the example of England, battleships and armoured cruisers were transformed into dreadnoughts and battle cruisers; the number of torpedo-boats was also increased. The North Sea naval bases—Wilhelmshaven, Heligoland, Cuxhaven—were strongly fortified, and submarine construction was energetically carried out. In 1912 a fifth squadron was established, the number of battleships raised by 3 to 41, the reserve ships being incorporated and the maintenance of a reserve abandoned; the number of light cruisers was raised from 38 to 40.

The naval budget increased from £21,700,000 in 1910 to £28,800,000 in 1914; and during these years the personnel of the navy increased from 57,070 to 79,070.

In the article SHIP AND SHIPBUILDING an account is given of the new warships built for Germany in these years. (*See also* NAVAL HISTORY OF THE WAR.) At the outbreak of the World War the fleet included 15 first-class battleships, 5 first-class battle cruisers, 22 older battleships, 7 older armoured cruisers, 29 light cruisers, 100 torpedo-boats, 14 mine-layers, 106 mine-sweepers, 27 submarines, 3 naval airships, 6 seaplanes and 6 aeroplanes. By Nov. 1918 it included 19 first-class battleships, 6 first-class battle cruisers, 5 older battleships, 2 older armoured cruisers, 18 light cruisers, 188 torpedo-boats, 6 mine-layers, 394 mine-sweepers, 3 seaplane-carriers, 206 submarines, 9 airships, 879 seaplanes, and 360 aeroplanes.

The losses during the war comprised one battle cruiser ("Lützow"), one older battleship ("Pommern"), 6 older large cruisers ("Scharnhorst," "Gneisenau," "Blücher," "Prinz Adalbert," "Yorck," "Friedrich Karl"), 18 light cruisers ("Magdeburg," "Ariadne," "Mainz," "Köln," "Hela," "Königsberg," "Emden," "Leipzig," "Nürnberg," "Dresden," "Undine," "Bremen," "Wiesbaden," "Elbing," "Rostock," "Frauenlob," "Breslau," "Karlsruhe"), 98 torpedo-boats, 3 mine-layers, 71 mine-sweepers, 55 airships, 194 submarines, and 128 other vessels.

*After the War.*—Under the revolution the inner organization of the navy was severely strained but not destroyed. Order was gradually restored. The authority vested in heads of staff and administration was revived as the Government grew stronger and the liquidation of the war could be begun. The surrender of the ships composing the High Seas Fleet took place on Nov. 21 1918. In the interest of historical truth it must be recorded that the German crews, who had received the news of the surrender with shouts of joy, proceeded with the ships to the Firth of Forth in the firm belief that it was a question only of a temporary internment and not of the complete surrender of the fleet. The German officers acted from a strict sense of duty and under the same conviction. It is only fair to say that it was when it became known to them that in this expectation they had been deceived, that the officers and crews sank their ships in Scapa Flow on June 21 1919.

Side by side with the fulfilment of the Peace Treaty went the reëstablishment of discipline. In particular the 2 naval brigades, formed from volunteers, and a few cruisers and torpedo-boats set an example of military obedience and loyalty to duty. From the example set by them grew the restoration of the *moral* and organization of the navy, which was seriously but transiently disturbed once more by the Kapp "Putsch" on March 13 1920.

In 1921 the navy was organized as follows: The control of the navy was, like the control of the army, incorporated in the Ministry of the Defence of the Reich (*Reichswehrministerium*) in Berlin and was subordinated to the political minister at the head of that department. It includes the functions of the former Admiralty staff, Naval Cabinet and Admiralty, and therefore embraces the command and the administrative authorities. Subject to the head of the control of the navy are:—the Navy Command Department (including the defence department, for organization, training, and welfare, and the fleet department, for military dispositions, developments in fighting material, strategic and tactical questions); the General Navy Department (including the dockyards section, construction department, armament section, nautical section, and water transport section); and the Navy Administrative Office (naval stores, accounts, pay). In addition there are the central department, the financial department, and the medical department; and further, for both army and navy, the legal department and the intelligence department.

The naval forces were:—Baltic Station: the battleships "Hannover," "Hessen," and "Schleswig-Holstein"; the cruisers "Medusa," "Thetis," and "Berlin." North Sea Station: the battleships "Braunschweig," "Elsass," and "Schlesien"; the cruisers "Hamburg," "Arcona," and "Amazone"; together with two flotillas of torpedo-boats (each of 6 larger and 6 smaller boats), and 4 gunboats ("Drache," "Hai," "Fuchs," "Delphin"). Also there were several mine-sweeping flotillas. It was intended to replace obsolete ships, and a vote for the construction of a new cruiser was passed in 1920–1. The naval dockyard in Kiel had been made over to a private company, the navy retaining only the smaller portion of it as an arsenal. The Wilhelmshaven dockyard was greatly diminished in extent. In that part which was given up there is now a fishing harbour. The shipbuilding yards are used for merchant vessels and steam trawlers.

In accordance with the peace terms the naval personnel numbers 15,000, of whom 1,500 are officers. Compulsory service is abolished. Every volunteer agrees to serve 12 years, and every officer to serve 25 years, or until the age of 45.

The legal basis of the navy is embodied in the Law of April 16 1919 and the National Defence Law of March 19 1921. To these must be added the Pay Law and the Pensions Law. The estimates are fixed annually; for 1921 they were for 652,000,000 marks.

### REFORM OF THE SCHOOL SYSTEM

Under the Empire, education had been regulated by the separate states and was left outside the imperial jurisdiction. But the new republican constitution of the Reich laid down in its section on first principles those which should regulate education in the different territories. A positive step was thus taken in the direction of the movement first started about 1848, and supported by German educationists, particularly at the teachers' conference at Dortmund in 1908, by the Social Democrats at their party congress at Mannheim in 1906, and in the debates of the Reichstag from 1912 to 1914, for introducing imperial legislation based on one universal and secular school system. An Imperial Schools Commission or Board had been in existence since 1871, but its functions were of a very limited character.

During the discussions of the committee for drafting the new constitution it was especially the Social Democrats, the Independents and the Democrats, but also the Catholic Centre party and the *Volkspartei* (formerly the National Liberals), who worked for a new organization of the schools system directly under the Reich. The movement encountered various hindrances: the signing of the treaty; the withdrawal of the Democrats from the Government; the first educational compromise between the Catholic Centre and the Social Democrats which gave local option to individual parishes to choose between denominational, bidenominational, and secular schools; and the final educational compromise of July 31 1919, whereby bidenominational (Catholic and Protestant) schools became the norm, purely denominational and secular schools being, however, expressly recognized by law as exceptions to the rule. But in spite of these hindrances a number of principles were accepted and laid down in section 4 (Arts. 142-50) of the constitution which came into force on Aug. 11 1919. These principles were that educational institutions should be public, that teachers should be uniformly trained, that there should be State inspection, and that there should be a standard type of school, the concessions for private schools being limited, while private schools for preparing pupils for the national schools should be abolished. It was also laid down that there should be instruction in citizenship, handicrafts and religion.

The application of these constitutional principles took place not through any grand general law of the Reich but by means of measures of a transitional character or measures dealing with parts of the subject, but all based upon the main plan. The first step was the law of the Reich dated April 28 1920, dealing with elementary schools and abolishing preparatory schools (Art. 146, 1). The elementary school, which is compulsory for everyone, covers the first four years' work of the preparatory school (*Vorschule*). The date for the final abolition of public preparatory schools was fixed for the financial year 1924–5, that of private preparatory schools for the year 1929–30. The Ministry of the Interior explained that the passing of this measure before the expert opinion of the National Teachers' Conference had been heard was due to the pressing necessity for settling the question of the elementary schools with all speed. It was only in March 1921 that the Prussian Ministry of Education could issue instructions for the carrying-out of the law, and for the curriculum of the elementary schools in Prussia.

Further, in order to give effect to the educational compromise, a bill for carrying out Art. 146, 2, of the constitution was laid before the Reichstag. It sets up as the standard type a more comprehensive school than the bidenominational type (*Simultanschule*) hitherto recognized as the standard. It recognizes Protestant and Catholic schools, purely secular schools, and also schools based on some particular philosophic conception or doctrine (*Weltanschauungsschule*), such as positivism, in order to give every class of opinion its rights. There was sharp contention about the definition of this comprehensive standard school (*Gemeinschaftsschule*). The non-Socialist Democrats regarded it as a further development of the existing bidenominational school; the parties of the Right and the Catholic Centre as the continuation of the older bidenominational schools, which were on a Christian basis, and of former denominational schools; the Socialist parties of the Left conceived it as a frankly secular school.

Beyond the scope of these school laws is the law on the Religious Education of Children (July 4 1921), regulating the religious education of children of mixed marriages. It was voted unanimously. Finally, a bill was introduced to deal with special aspects of the welfare of the young and in particular with the education of abnormal children, of those who are subject to prejudicial moral surroundings, and of orphans, etc. Radical changes in the relations between parents and the school were effected by the Prussian ordinance of Nov. 5 1919 on the formation of Parents' Advisory Councils in connexion with schools.

### Social and Industrial Legislation

I. *The Pre-War Period, 1911 to 1914.*—Workmen's insurance against sickness, old age and invalidity, which had been introduced by Prince Bismarck in the years 1884–9, and had been extended by repeated amendment laws, underwent, after lengthy preparation and debate, a reform which was finally completed in the system of insurance for the Reich of July 19 1911. Fundamentally the law remained the same, but the ranks of the insured were extended. The interrelation between the different forms of insurance and their administrations were more clearly defined, and in addition provision was made for the widows and orphans of insured persons. Miners were not included, as they retained their old insurance system under the mutual system of the *Knappschaft* (Miners' Association).

The law of Dec. 20 1911 introduced special insurance for salaried employees in commerce, industry and shipping; for persons employed in theatres and orchestras; for teachers, tutors and governesses; it gave medical treatment and an allowance during invalidity and also to all insured persons over 65 years of age. The means were supplied by contributions from employers and employed, without subvention from the State. The free mutual-aid societies, which existed side by side with the legalized State insurance system, were placed under the control of the State department which supervised private insurance.

As regards the protection of workers, one of the darker sides of the economic life of the people was touched by an attempt to regulate home industries by the law of Dec. 20 1911, which came into force on April 1 1912. It included registration of workers employed in home crafts, the introduction of wages books, public exhibition of wages tables, regulations for the protection of children and young persons, prophylactic hygienic measures, and the establishment of committees with equal representation of employers and employed for the regulation of conditions of work, but without the right to fix a legally binding minimum wage.

A limitation and modification of the law, prohibiting assistants from taking employment in works of a similar character to those which they left, was brought about by the Act of July 10 1914. The duration of this "prohibition of unfair competition," as the law was called, was limited to 2 years, an important matter for minors and, for assistants receiving low salaries. During the period of the prohibition the employer had to pay compensation for unemployment.

In contrast to these advances in social insurance and the protection of workers, the legal rights of labour were not only neglected during these years but actually diminished. This was not the result of actual legislation, but was brought about through the administration of justice and by the police. The trade unions, contrary to the Associations Law of 1908, were treated as political unions, and this greatly hampered their activity. The cry for the limitation of the right of combination (the prohibition of picketing and protection of blacklegs) grew steadily louder. A legal regulation of the wages contracts and the methods of settling disputes was expressly rejected by the Government. A halt was called in the whole course of social political legislation. Slackness in matters of social policy was succeeded by frank reaction. The outbreak of the World War at once created a new atmosphere affecting opinion and practice rather than legislative activity.

II. *The War Period, 1914 to Nov. 1918.*—The necessities of war-time, which demanded that substitutes should be found for the workingmen who were called to the colours, entailed a temporary suspension (Aug. 4 1914) of the regulations for the protection of women and young workers (10-hour day, night rest, prohibition of unsuitable employment); but official warnings to be careful in these matters were repeatedly issued (Dec. 11 1916 and Aug. 11 1917). The prohibition of night work in bakeries (Jan. 15 1915) and of the use of white lead for painting (Oct. 25 1915), as well as ordinances concerning 7-o'clock closing for shops and the raising of the amount of wages exempted from sequestration for debt (Dec. 13 1917), also remained in force throughout the period of the war. The policy adopted in regard to wages by the military authorities was of especial importance in that it insisted on sufficient payment for army contracts carried out by home industries, and in some districts even made a minimum wage legally obligatory.

In order to maintain workers' insurance during the war, the Federal Council decreed by an ordinance of Aug. 4 1914 that the necessary measures should be taken for this purpose especially in regard to the sickness-fund organization. In the course of the next few years several reforms of lasting value were carried out:—Maternity benefit (*Wochenhilfe*) was provided (Dec. 3 1914), giving monetary aid during and after childbirth, and while the child was being nursed by the mother; the age at which an old-age pension became payable was lowered from 70 to 65 (1916); illnesses commonly contracted in particular industries were included in the accidents insurance scheme (Oct. 12 1917); repeated increases were made in the benefits from sickness and disablement insurance and insurance in the interests of survivors, and the wages at which insurance became compulsory were scaled up.

The labour exchanges were made more uniform, and surveys of the whole labour market were published at short intervals, vacancies being grouped locally; but in spite of petitions from trade unions and resolutions of the Reichstag (1915) there was no thoroughgoing legislative systematization in the matter of unemployment.

In Feb. 1918 the Government laid a bill before the Reichstag, concerning the establishment of Labour Chambers (*Arbeitskammern*) in which employers and employed were to be associated on the basis of different trades for joint discussion of their affairs, but owing to sharp differences of opinion it was not passed.

On the other hand, the trade unions at last had their rights acknowledged. They were no longer persecuted by the police and the administration of justice on the plea that they were "political"; the authorities recognized their assistance in public work as indispensable, and the consequences of this acknowledgment found expression in legislation. The Associations Law was altered (Aug. 1916) in so far as trade unions were expressly exempted from the restrictions imposed upon political unions, and the prohibition of the use of foreign languages in meetings was abolished (April 1917). The law of May 22 1918 suspended Art. 153 of the body of regulations affecting industrial occupations (*Gewerbeordnung*), which had for 50 years placed under special and vindictive legal provisions workers who had been guilty of offences during strikes and lockouts.

The most important act of social legislation during the war was the law concerning war-work (*Vaterländisches Hilfsdienst*) of Dec. 6 1916. It obliged every male between the ages of 17 and 60—who was not serving in the army—to work at war industries,

at agriculture, in hospitals or in the work of securing food supplies for the nation. In order to settle disputes arising from this compulsory labour—as, for instance, whether an industry fell under the head of war-work, whether the worker was capable of complying with the regulations, or whether he might change his place of work—conciliation boards were established, composed half of employers and half of employees, under official guidance. They had the right of giving arbitral decisions. With the object also of cultivating good relations between employers, workers and salaried employees, workers' boards were compulsorily established in the various industries. The execution of the law rested with the Minister of War, with whom a committee of the Reichstag was associated for this purpose. The last act of social legislation during the war was the establishment of a Ministry of Labour for the Empire, with a leading trade unionist as Minister (Oct. 4 1918). This dealt with matters of social policy which had previously appertained to the Department of the Secretary of State for the Interior, or the Department of National Economy.

III. *After the Revolution.*—After the Armistice supreme authority passed into the hands of the Commissaries of the People. One of their first edicts (Nov. 12 1918) contained important acts of industrial legislation; the right of forming associations and holding meetings was freed from all restriction; the law concerning war-work was suspended, except that the conciliation boards remained; the regulations concerning domestic servants were repealed, as were also the special laws which bore hardly upon agricultural labourers. The provisions for the protection of workers, which had been suspended at the outbreak of the war, were again put into force. Apart from these ordinances, which had the effect of laws, it was announced that the 8-hour day for workers would come into force by Jan. 1 1919, at the latest.

On Nov. 18 1918, the Commissaries of the People, by official decree, gave the status of law to an agreement which had been concluded by the great employers' unions and the trade unions. This agreement covered the following points:—Recognition of the trade unions as the elected representatives of the workers; free right of association; no support to "yellow" unions; reëmployment of ex-service workers; supply of raw materials and placing of orders; equal distribution of work; regulation of terms of labour by collective agreements (wages contracts); establishment of workers' boards, conciliation boards and boards of arbitration; introduction of an 8-hour day; and the establishment of a central committee to carry out these measures.

On this basis the ordinance for the regulation of hours of work for industrial workers (Nov. 23 1918) was framed, which fixed the length of the working day in all industrial concerns. The same was done for the transport services by the ordinances for railways and the post (Nov. 24 1918), and for salaried employees (March 18 1919), as well as for bakeries (Nov. 23 1918), in the case of which night-work between the hours of 10 P.M. and 6 A.M. was forbidden. Finally a provisional ordinance of Jan. 24 1919 fixed the hours of work for agricultural labourers at 8, 10 and 11 hours during 3 periods of 4 months respectively, overtime being permissible. In April 1919 the miners in the Ruhr district were granted a 7-hour day, including the time spent in descent and ascent. The hours of Sunday rest in commercial establishments, shops and offices were extended (Feb. 5 1919). All these regulations, as was expressly stated, were only intended as provisional measures, especially for the period of demobilization.

Demobilization in its social, political and economic aspects, and the regulation of the labour market, demanded a special organization, in view of the vastness of the task of finding work for the millions who were returning from the fronts, and the change from the economics of war to those of peace-time. As early as Nov. 12 1918 a Government office for demobilization was established. Among its numerous ordinances and measures the following were of particular importance for the legal rights of labour: Regulation for the engagement and dismissal of workers and salaried employees (Feb. 12 1920); for making places free for workers (April 25 1920); for remedying the scarcity of labour in agriculture (March 16 1919); for the enforced employment of seriously injured ex-service men (April 4 1920); for the stricter regulation of distribution of work (Dec. 9 1918); for the carrying-out of measures of relief for the unemployed, partly by means of monetary support, partly by finding work through the collective efforts of the Reich, the state and the commune. The Government office for demobilization was abolished on April 26 1919. Its duties were taken up by the respective ministries of the Reich; and the demobilization commissioners and committees were, for the most part, abolished in April 1921.

The legal position of labour underwent an important development in three directions during the period of transition, by means of the ordinance of Dec. 23 1919, which was subsequently endowed with the force of law. The wages contract was declared to be universally binding. All concerns with 50 or more employees must institute workers' committees for the safeguarding of workers' rights. The war-time conciliation boards were regularized and firmly established. The committees for the different occupations, which had been contemplated in the Home Employments Law of 1911, but had not yet been put in force, were called into being on Jan. 13 1919 and given extended powers. In the beginning of May 1919 an expert committee was formed in the Ministry of Labour in order to frame a uniform system of labour law. The decisive turn in labour legislation, however, was taken by the Factory Councils Law (*Betriebsrätegesetz*) of Feb. 4 1920, which entrusted the representatives of the employees, who now replaced the former workers' committees, with the task of upholding the common economic interests of workers and salaried employees in their relations with the employers. This law is described fully in the separate section below.

IV. *International Labour Laws.*—Germany, which for 30 years had striven both officially and by the efforts of independent organizations after an international coördination of legislation in the matters of social policy, declared in the constitution of the Reich of Aug. 11 1919:—

"The Reich advocates a regulation by agreement between different states of the legal position of workers, so as to win, for working classes of mankind, a universal minimum of social rights."

Without being a member of the League of Nations, Germany was admitted to the International Labour Organization by decision of the General Conference of Washington (Oct. 31 1919); she had two seats in the Administrative Council of the International Labour Office, and took part in the annual conferences.

The main principles for the development of German labour legislation are laid down in the constitution of the Reich. The economic life of the nation must be ordered in accordance with social justice and must aim at securing for all an existence worthy of human beings. Within these limits the economic liberty of the individual is to be assured (Art. 151). Labour is under the special protection of the State; the Reich will frame a uniform body of labour laws (Art. 157). The right of association for the purpose of guarding and improving the economic and industrial conditions of work is guaranteed to everyone and to all occupations. All agreements and measures which aim at restricting or diminishing these liberties are illegal (Art. 159). For the maintenance of health and ability to work, for the protection of motherhood and for securing provision for the economic consequences of old age, ill-health and the accidents of life, the Reich has created a comprehensive system of insurance, in which the insured persons play a decisive part (Art. 161). Without any infringement of his personal liberty, it is the moral duty of every German to employ his intellectual and physical powers in such a manner as is demanded by the welfare of the whole community. Every German shall be given the opportunity of earning his living by economically productive work (Art. 163). Workers and salaried employees have the right to coöperate on equal terms with the employers in regulating the conditions of wages and work, as well as in the entire economic development of the means of production. The organizations of both parties and the agreements effected by them are recognized (Art. 161, 1).

Besides the industrial councils, an Economic Council of the Reich was established in June 1920 as an advisory body; regional economic councils were in preparation in 1921, and a thorough-

going reform of the whole system of social insurance was being undertaken. A Government Labour Exchange Department for the Reich supervises and regulates the labour market. The *Reichsarbeitsblatt* (Labour Gazette of the Reich) reports all that goes on in connexion with labour legislation. (E. F.*).

### The Factory Councils Law

The idea of securing representation for workers in the conduct of the establishments in which they work is not new. It was bound to arise from the special character of modern great industrial enterprises, in which the majority of the employees have a common interest in their position as regards their employer. The idea of such representation was confronted by obstacles such as a claim of the employer to authority and his determination to be "master in his own house," and, on the other hand, the legal conception that contract alone determined the relations between the two parties, so that the employer had only to do with the individual employee. The instances in which the employer voluntarily recognized the right of his workers as a body were rare; exceptions, such as were made by philanthropic employers like Abbe and Freese,—the former at the well-known Karl Zciss works at Jena,—were very rarely imitated. There were extremely few cases before the World War in which a collective wages tariff was set up. It is true that wages-tariff contracts had succeeded in finding a foothold in workshops (*Handwerksbetriebe*) and industrial establishments of medium size, and that the extension of the principle of collective-wages contracts was being vigorously advocated among the working classes. The great German employers of industry, however, declined to have any dealing with the workmen's organizations. It was for this reason that the method of wages-tariff contracts was comparatively seldom the means of establishing representation of workers in the concerns in which they worked. Legislation continued to avoid the subject. It is true that the industrial regulations for the German Empire recognized committees of workers; but these were not obligatory and they had no decisive rights or functions. The one exception was the mining industry. In this instance, after fierce struggles, the introduction of obligatory committees of workers had been secured, particularly in Prussia. The rights of these committees were no doubt extremely limited. Nevertheless, an instrument for negotiations had been constructed for the miners, and with it at least opportunity for the regular exchange of views had been secured.

The war undermined in Germany the old conception of the position of the "masters." The desire to preserve social peace during the war became, as in all countries, a national anxiety. The employers were accordingly urged to conclude wages-tariff contracts. These contracts set up representation of the workers for the separate industrial establishments; a representation which, it is true, was invested with only limited rights. But more than anything else it was the War Emergency Law for securing Auxiliary Service (*Hilfsdienstgesetz*), imposing upon all able-bodied men the legal duty to work, which promoted the conception of the establishment by legislation of representative bodies of workers. The employee, according to the terms of the Hilfsdienstgesetz, could no longer exchange his employment for another without a special certificate (*Abkehrschein*). There had thus been instituted an obligation to continue to work in a particular establishment, or in other words a legal restriction of liberty for which some counterbalancing advantage had to be secured for the other party. If the employee was chained to the establishment in which he worked, it was only right that he should obtain influence upon the conduct of that establishment. The Hilfsdienstgesetz accordingly set up, in the form of obligatory workers' and salaried employees' committees, organs of the employees in each industrial establishment, and these representative bodies had above all the right, in disputes where all the workers were involved, to appeal to the services of a Board of Settlement, thus making the matters in dispute between the employers and employed more or less matters of public interest.

Such was the situation with which the so-called "Councils Movement," following upon the Revolution, was confronted. There were several tendencies which converged in that movement. In the first stage, when in all the larger towns great placards were exhibited bearing the words "All power to the Workmen's and Soldiers' Councils," the Councils Movement appeared to be merely an imitation of what had taken place in Russia. But it was an elemental impulse which drove the masses into the streets. It was an instinctive revolt against the mechanical apparatus of the authority in control of industrial establishments. The old authority of the State had collapsed. The idea of liberty seemed to know no bounds. What could appear more natural to the masses, whose powers of endurance had been totally exhausted by war and privations, than to demand the control of the establishments in which they worked? This instinctive movement, regarded historically, was a relapse into the earliest stages of the development of socialism. Just as the masses had formerly attempted in blind despair to destroy the machines to which they attributed their distress, so now they directed their attacks against the great citadels of the factories, which they regarded as the source of the merciless exploitation of their minds and bodies. If it be further borne in mind that Germany at that time was in the trough of the sea and that there seemed no glimmer of hope that she could again recover in the ordinary way, it will be understood why this movement possessed such a mighty force and why it actually threatened to swallow Germany up. The newly established State was confronted with the task of adopting the legitimate and practical demands of the movement and giving them form and shape. The outcome of this policy is embodied in Art. 165 of the constitution of the Reich, which was framed after great strikes and as the issue of bitter conflicts and prolonged debates at the Congresses of the Councils in Berlin. The text of Art. 165 is as follows:—

"Workers and salaried employees are entitled to coöperate on equal terms with the employers in the settlement of the conditions of wages and work, and also in the whole economic development of the processes of production. The organizations of the parties on both sides and their mutual agreements shall be recognized.

"For the furtherance of their social and economic interests workers and salaried employees shall have legal representation by means of Industrial or Factory Workers' Councils (*Betriebsarbeiterräte*), and also by District Industrial Councils (*Bezirksarbeiterräte*) distributed according to industrial regions, and by an Industrial Council for the whole Reich (*Reichsarbeiteramt*).

"With the object of fulfilling the whole of their economic tasks and of coöperating in the execution of the Socialization Laws, the District Workers' Councils and the Workers' Council of the Reich shall meet the representatives of the employers and of any other interested sections of the population through the medium of District Economic Councils and the Economic Council of the Reich. These District Economic Councils and the Economic Council of the Reich shall be so constituted that all the leading industrial occupations are represented in them in accordance with their respective economic and social importance.

"Social or economic bills of fundamental importance shall be laid by the Government before the Economic Council of the Reich for its opinion before being tabled in the Reichstag. The Economic Council of the Reich shall itself have the right to propose the introduction of bills of this nature. Should the Government not agree to a bill proposed by the Economic Council, the bill must nevertheless be submitted to the Reichstag. The Economic Council of the Reich may have the proposed bill submitted to the Reichstag by a member of the Council.

"Powers of control and administration may be conferred upon the Workers' and the Economic Councils in the spheres assigned to them.

"The development of the Workers' and Economic Councils and the functions to be assigned to them, as well as their relations with other self-administering bodies occupied with questions of social policy, fall exclusively within the province of the Reich."

Article 165 of the constitution of the Reich, containing the general programme for prospective German legislation concerning the Councils, is based upon four main principles.

The first principle is the idea of a separate economic constitution within the State, side by side with the political constitution. Within the last 30 or 40 years the powers of the State have been enormously increased; it has been increasingly empowered to intervene in social and, more particularly, in economic matters and to regulate them. In the present generation this tendency will be strengthened, for the idea of "economic freedom" is receding and every kind of economic activity is being subjected

more and more to the tendencies of organization. The idea is steadily gaining ground that the economic activities of a people form one great organism, and that for this reason a general economic administration is necessary in order to put production on a rational basis and to promote social justice. But how can the State perform the tasks of general industrial administration, seeing that it is overwhelmed by other duties? The methods of the State are political methods, but the management of economic enterprises requires special technical knowledge and business methods. The idea of a general management of economic enterprises is therefore inseparable from the idea of a special economic constitution with independent machinery to enable it, on behalf of the State, to fulfil these general economic functions. The machinery of a separate economic constitution of this nature is to consist of the Councils referred to in Art. 165 of the constitution of the Reich.

The second principle is the ideal of an economic democracy. Up to the present time economic enterprise has been the private affair of the persons engaged in it. They were the creators of the industries and to them alone the products of labour belonged. They alone were responsible for what took place in the economy of the enterprise; the employees were not regarded as coöperating with them, but merely as their assistants who could act only in accordance with the wishes of those conducting the business. They received their wages; the method of conducting the business was no concern of theirs. They had no voice in framing the regulations affecting relations between employer and employed; they had nothing to do with the way in which the enterprise was conducted. "Industry," "commerce," and "agriculture" were alike represented, not by employers and employees, but solely by employers. Economic democracy, however, calls upon the employee to join in determining not only the conditions on which labour is hired but also questions concerning the management of the business. Such questions are to be regarded as the concern both of employer and of employed. The employee must not only concern himself with his own particular task, but he must also consider the object of all labour, which is to provide the whole community with economic products. Hitherto Germans have been living in a period of economic autocracy; now a constitution had to be framed which should give the employee the right of coöperating in the sphere of business management and social welfare. This was implied in the first paragraph of Art. 165, by which the workers and salaried employees are entitled to "coöperate on equal terms with the employers in regulating conditions of work and wages and also in the whole economic development of productive capacity."

The third principle is the construction of a system of representation of labour in accordance with the principles of association and of community of interests. Social life is comprised in two manifestations of the human will. In the one man is opposed to man, group to group, interest to interest. The struggle for existence is the essence of it. In the other, connexions are formed between individuals and between groups, which are subordinated to a higher unity in order to achieve a common object. In this manifestation the guiding principle is that of mutual aid. If this two-fold object of the forms of social life be applied to the organization of labour, the legislator finds himself confronted by two distinct tasks. On the one side he must institute organs of representation by means of which labour may look after its own special interests in the face of interests which conflict with them. On the other hand he must institute for labour such means of representation as may enable it to coöperate with, and to have a saying in, the decisions of other organizations for their mutual benefit. It will be seen, therefore, that, according to Art. 165 of the constitution of the Reich, two kinds of councils have to be instituted. In the one kind the workers and salaried employees obtain, "for the protection of their social and economic interests, legal representation on Industrial Factory Councils and also on Regional Workers' Councils and in a Workers' Council for the whole Reich. In the other kind the District Workers' Councils and the [illegible]ers' Council," in order to fulfil their economic tasks [illegible] to coöperate in the execution of socialization laws, shall meet the employers' representatives and delegates from other sections of the people concerned in District Economic Councils and in an Economic Council for the whole Reich. These District Economic Councils and the Economic Council for the Reich shall be so constituted that all the leading groups of trades are represented on them in accordance with their economic and social importance."

The fourth principle is concerned with the future relations of these councils with other forms of organization by which employers and employed have hitherto managed their mutual affairs. Economic and social life is not organized by the State alone; it organizes itself in various forms. One of the most important is the collective-wages tariff. Since the end of the war another form of self-determination has arisen, that of *joint labour organizations*, in the shape of unions of employees' and employers' associations (*Arbeitsgemeinschaften*) for the purpose of dealing with questions connected with particular trades which affect both parties, more particularly economic questions. There are joint organizations of this kind for industry, commerce and agriculture. Collective-wages contracts and joint labour organizations constitute the voluntary bodies for self-administration in the constitution, which was the object of the legislation in regard to councils. The councils legislation does not aim at suppressing the activities of this social self-determination, but at maintaining it, and at linking it up with the economic structure as a whole. This is the meaning of the second sub-section in Sect. 1 of Art. 165 of the constitution of the Reich by which the organizations of both parties and the agreements between them are "recognized," and of the final sentence of this article in which the adjustment of the relations between the statutory councils and these social autonomous bodies is regarded as the business of the Reich.

Up to the autumn of 1921 the Factory Councils Law of Feb. 4 1920 (*Reichsgesetzblatt*, p. 147) had been the only piece of legislation enacted to carry out Art. 165 of the constitution; the Economic Council of the Reich had been instituted provisionally; its functions had not yet been defined in detail. Arrangements for the formation of the District Economic Councils were still proceeding; they were bound up with more extensive plans for administrative organizations, in particular with the question of the formation of so-called industrial provinces. The main lines of the Factory Councils Law are as follows:

Factory councils are to be established in all factories employing as a rule a minimum of 20 workers. These councils deal with the conjoint economic interests of the employees (wage-earning workers and salaried employees) in their relations with the employer, and are to assist him in carrying out the objects of the industrial enterprise in which they are engaged. For the protection of the particular economic interests of the workers and salaried employees in their relations with the employer, separate workers' councils and salaried employees' councils shall be established in all factories where factory councils exist in which workers and salaried employees are represented. Public officials and candidates for official posts are not regarded as employees. Home workers who, in the main, work for the same factory and do not themselves employ others have a special council in those factories where a minimum of 20 home workers are employed. The establishment of special industrial councils for those who are employed in maritime and inland navigation is contemplated. By the term "factories" (*Betriebe*) is understood all factories, businesses, and managements both publicly and privately owned—that is to say, not households, but State and communal factories, in so far as workers and salaried employees not officials are employed. The factory council consists of at least 3 and at most of 30 members, according to the size of the factory. Those members of the factory council who, as workers and salaried employees, are also members of the workers' or the salaried employees' council are chosen by direct and secret vote on the system of proportional representation; they are elected for a period of one year, and are eligible for reëlection.

All male and female workers over 18 years of age who enjoy full civil rights have the right to vote. Electors over 24 years of age who are citizens of the Reich, who have passed the stage of apprenticeship, and who on the day of election have been employed in the factory or business for at least 6 months, and have been engaged in that particular branch of industry or occupation for at least 3 years, are eligible for election. The members of the factory council and their representatives are to fulfil the duties of their office without payment and as honorary officials. In factories where, as a rule, less than 20, but more than 5, workers having the right to vote are employed, of whom at least 3 are eligible for election, a factory

steward (*Obmann*) must be elected. Apart from a few details the factory steward has the same rights as the factory council or the workers' and salaried employees' councils.

The factory council is the organ of the whole of the workers in a factory, but it is also an official body (*Amt*).

As an organ of the workers the factory council safeguards their collective interests and also the interests of individual workers. The interests of the workers collectively are concerned with matters connected with labour and factory management. These two subjects must be carefully distinguished. In so far as the factory council is concerned with matters affecting conditions of labour, it only represents a considerable advance along the lines on which the wage-earners' and salaried employees' committees under the old legalized system had already started. In so far as it deals with questions affecting the business management of the factory it is taking the first step in a new development, the essential principle of which lies in the fact that the worker is henceforth to have a direct interest, not only in matters connected with his work but also in matters connected with the management of the factory, and that the workers collectively are to be entitled to exercise influence requisite for this purpose. The interests of individual members of the whole working staff are protected by the factory council more particularly in cases coming under Sect. 34 of the Statute, according to which, in the case of notice of dismissal being given on the part of the employer, the worker, within 5 days after such notice, may enter a protest by appealing to the workers' or salaried employees' council. This council, if there is reason to believe that the notice of dismissal was unwarranted, may then intervene with the employer on behalf of the worker, or, if an agreement is not reached within one week, it may appeal after a further interval of 5 days to the Conciliation Board.

The factory council exercises the functions of a department of the public service (*Amt*) in those cases in which duties appertaining to the State are assigned to it, the State having invoked its assistance. Such duties comprise, above all, the vindication of the legal rights and the protection of the interests of the workers. Thus, the factory council must see that, in matters concerning the work of the factory, the decisions of a Conciliation Board, or of any other body to which by consent differences have been submitted, are carried out, and that the statutory regulations and other measures which have been enacted for the benefit of the workers are observed. The council must also devote its attention to the prevention or removal of conditions in the factory which involve the danger of accident or are prejudicial to health. It must give its assistance to factory inspectors and other officials occupied with these matters, and must offer suggestion, advice, and information. It must also see to it that police regulations in regard to industrial occupations and regulations framed to prevent accidents are carried out; and it must appoint one of its members to be present at inquiries into accidents which may be instituted by the employer or by the factory inspector or other competent authority.

In addition to the exercise of these statutory powers the factory council may, in particular cases, exercise special functions by virtue of a mandate conferred upon it by the persons concerned. Thus, individual workers in a factory may ask the council to act for them. In that case the council acts as the representative of the interested party in the ordinary legal sense of the term. A factory council may also have conferred upon it by a wages contract functions for which the Factory Councils Law did not provide. A way is thus left open for the adaptation of the council to special circumstances and needs. In no case may the statutory powers of this representative body in a factory be withdrawn from it by private agreement between the parties concerned.

The workers' demand for a voice in the management of factories arose in the first place from a vague but intense longing for emancipation from the lifeless mechanism of factory routine. The worker wanted to be in a position to shape the conditions of his or her occupation, a thing which had become impossible in the mechanized system and the division of labour which prevails in factories on a large scale. This longing soon took shape in the demand that the assent of a factory council invested with equal rights should be requisite for all dispositions made by the employers. The law as it now stands has accepted the fundamental idea of this councils movement, but has by no means met the demand in full.

A voice in shaping decisions is only possible where right of acting together with the employer is conferred upon the factory council. The council has this right in regard to the issue of regulations regarding the work, the framing of factory by-laws, the fixing of wages and other conditions of labour. It also has the right of coöperation in laying down the lines to be followed in regard to the engagement of workers, the fixing of penalties and the decisions of the Board of Supervision [1] (*Aufsichtsrat*) to which the factory council has the right to send delegates. It has further the same right to a voice in the case of the dismissal of a member of the representative body of the factory, which can only take place with the consent of the members of that body. The working regulations of the factory must be mutually agreed upon in all factories employing 20 or more workers, whereas formerly these regulations were issued by the authority of the employers alone. Should no agreement be arrived at the matter must be settled by the irrevocable decision of the Conciliation Board. The same applies to the fixing of penalties and the dismissal of members of the representative body of the factory. A voice in the decisions becomes illusory where the representative body of the factory is only able to exercise an influence upon the will of the employer. This influence may be exercised in two ways: in the first place by the workers' right to be heard (*Audienzrecht*), which means that, in certain cases, the representative body has the right to demand that the employer shall listen to what they have to say. In other cases this right may extend still further and enable the representative body to demand that the employer shall enter into negotiations with them, as, for instance, in the case of the engagement of workers and notices of dismissal. Finally, the right to be heard may take the more precise form of a claim to receive information from the employer, so that the latter is obliged to give particulars of anything that occurs which may affect the workers' contracts or their general activities. Similarly, the employer may be required to produce the wages books and the necessary proofs that existing wages contracts have been carried out. He may be required to furnish quarterly a report on the position and progress of the business and on the state of the industry in general; further, on the output of the factory and, more particularly, on the labour likely to be needed for it. The employer must likewise, on demand, produce for inspection a balance sheet and a statement of the profit and loss on the factory. The will of the employers can also be influenced by the right of the factory council to bring the employer before a court. The representative body may, in the case of differences, appeal to the Conciliation Board or to any conciliation or arbitration court which may be agreed upon. This right enjoyed by the representative body implies an obligation on the part of the employer to appear before the Conciliation Board. There is no obligation to negotiate, but a verdict may be pronounced, even if the other party has not appeared or has not negotiated. It is true that the verdict of the Conciliation Board, except in the cases mentioned above (working regulations, etc.), is not binding. The method of arbitration to be observed in the case of engagement of workers and notices of dismissal will be dealt with more particularly below, but it may be remarked here that, in accordance with a legal practice, generally adopted though not unchallenged, the demobilization commissioner is considered to be within his rights in declaring, by means of an administrative order, such arbitral decisions to be of binding force as would otherwise, according to law, not be obligatory.

The right to a voice in decisions affecting the engagement of workers and notices of dismissal requires special consideration. Legislation on this point encountered peculiar difficulties. The working classes pressed for unrestricted coöperation in all decisions concerning engagements and notices of dismissal. Serious strikes, more particularly of salaried employees and above all of bank clerks, occurred in connexion with this question. The employers fought for the maintenance of their absolute freedom as regards the engagement and dismissal of their staffs. The law is based on a compromise between these two demands.

In the first place, as regards the engagement of workers, the employer remains, as hitherto, unrestricted in the choice of his employees. But the Factory Councils Law provides that, as mentioned above, certain main lines for the engagement of workers may be agreed upon and that the employer shall be bound by them. At the same time the employer is not *under any obligation* to agree to such lines of action; so that this provision of the law may be rendered nugatory by him, unless the balance of power is such as to compel him to agree to accept general guiding lines for his action. If certain lines have been agreed upon the employer must observe them. If he deviates from them the representative body of the factory may appeal to the Conciliation Board. The Conciliation Board may issue a binding order that, in case of a departure from the course of action agreed upon, the contract of the employee with the employer shall terminate as soon as the decision has come into force, subject to the observance of the legal term of notice.

Of greater and more far-reaching significance than this coöperation of the workers' representative body in regard to the engagement of workers is the coöperation of this body in cases of dismissal. Sect. 84 of the Factory Councils Law directs that in all industrial establishments having a factory council, the individual worker, in case of dismissal by the employer, has the right to enter a claim within 5 days of the notice of dismissal by appealing to the workers' or salaried employees' council, "(1) if there is ground for the suspicion that the dismissal is due to the worker's sex, to his or her political, military or (religious) denominational activities or to his or her activities as a trade unionist, or to the fact that he or she does not belong to some particular political, religious or industrial association, or to some military society; (2) if notice of dismissal has been given without any reasons being assigned; (3) if the notice has been given because the worker has refused to undertake permanently other work than that for which he or she was originally engaged; (4) if the dismissal appears to be an act of unwarrantable severity not justified by the behaviour of the worker or the conditions in the factory."

When an employee has entered a protest with the workers' or employees' council against his dismissal, the council shall endeavour,

[1] Every limited-liability company in Germany has in addition to the directorate a smaller board of expert business men which exercises control or supervision over the directorate.

if they consider the objection justified, to come to an agreement with the employer by negotiation. Should no agreement be arrived at within one week the council may appeal to the Conciliation Board after a further period of 5 days. The individual worker who has received notice of dismissal enjoys the same right of appeal. Should the Conciliation Board consider the appeal against dismissal to be justified, and should the employer nevertheless refuse to continue to employ the worker in question, the committee shall then impose on the employer the obligation to give him compensation. The compensation shall be proportionate to the total number of years during which the worker has been employed in the factory, and may be reckoned for each year up to a maximum of one-twelfth of the amount of wages earned during the last year of employment. The total, however, must not exceed six-twelfths of that amount. In making this calculation the economic position of the worker and also the financial capacity of the employer must be considered.

The principle of the factory council was not accepted forthwith by the socialist sections of the community and by the trade unions. It is intelligible that the employer, who had been accustomed to autocratic position, would not feel well-disposed towards the institution of factory councils from which he apprehended unwarrantable interference in his affairs. But the fact that the zealous advocacy of factory councils met with opposition from the advanced sections of the labouring classes calls for explanation. The idea of factory councils was connected in Germany, as in other countries, with a wave of syndicalism. At first it seemed as though, by means of the factory councils, industries would be brought under the control of the workers, so that, in this way, industrial property might be transformed into the property of labour. A demand of this sort has always been contrary to the fundamental principles of socialism, according to which the socialization of industry should be effected not by and for separate industrial establishments, but by means of an economic community of the entire nation, which should control all the separate industrial enterprises. The syndicalist demand, moreover, was really contrary to the fundamental principles for which the trade unions had fought. They had always been organized on the basis of whole trades. They were united in a central organization, and their whole system was based on the perception of the fact that the regulation of wages and of conditions of labour depended on the state of the labour market, and that the labour market could be regulated for the benefit of labour only through trades unions on a large scale. The trades unions could not but fear that, if the real representation of labour became concentrated in the factory councils, the methods hitherto employed by the unions would be altogether superseded. And, indeed, the tendencies of the councils movement were in direct conflict with those of the trades unions.

It may now (1921) be asserted that these conflicting tendencies in Germany have been reconciled, although under certain circumstances the old differences might be revived. The view has prevailed that it is the business of the factory councils not only to safeguard the interests of particular factories, but also to be responsible for safeguarding the interests of the whole industrial economy. Moreover, the factory councils, as things have actually developed, have more and more become instruments of the trades-unions movement in the factories, so that the great impulses of the social movement continue, as before, to emanate from the trades unions. They have, in particular, kept a firm control of regulation of conditions of labour. The Factory Councils Law paved the way for this development. The factory council, from its whole structure, is intended to be not merely a representative body for the workers in a particular industrial undertaking. This, it is true, would be the historical development of the factory council from the fundamental ideas of the councils movement as described above. The factory council, however, is also to be conceived as an official institution designed to safeguard the interests of the whole industrial economy. This is expressly laid down in Sect. 68 of the Factory Councils Law, which says: "The factory council in carrying out its functions must endeavour to see that neither party puts forward demands or adopts measures which would be prejudicial to the general interest." As regards the relative position of the trades unions, the Factory Councils Law is carefully framed so that in all cases of dispute the precedence of the trades unions shall be recognized. For this reason the wages contract takes priority of any other agreements between the factory council and the employer. For the same reason the representatives of the trades unions have the right to attend the meetings of the factory council and to take part in the general meetings of the factory workers. More especially, the right of the trades unions to represent the workers in negotiations with the employer is not affected by the right of representation enjoyed by the factory council. This point is determined by Sect. 8 of the Factory Councils Law, which says: "The right of economic associations of workers and salaried employees to represent the interests of their members is not affected by the provisions of this law."

What is the significance of the German factory council in the social movement of labour? That the rights of labour have been extended by the factory council is beyond all doubt. Where factory councils are in existence arbitrary conduct on the part of the employer in regard to matters fundamentally affecting conditions of labour is rendered impossible, and the legal position of the worker in the industry is firmly established. Rights hitherto exercised by the employer without any restriction—such as, for instance, the right to issue factory regulations, to fix penalties and to give notice of dismissal at will—have been limited. The worker's sense of his own personality has thus been raised. But, above all, the worker's sphere of influence has been extended to a province from which he was hitherto excluded. This province is the conduct of the business. It is true that the powers of the factory council in this sphere are not so far-reaching as in the sphere of the regulation of conditions of work. The actual right to a voice in business decisions has nowhere been conceded to the factory council. The employer, however, is obliged to answer questions put to him with regard to these matters; he must discuss them and must lay facts and figures before the council. Nevertheless, in forming an opinion on the right of the workers to a voice in the business conduct of an enterprise, it must be remembered that the precise limits within which the law permits such coöperation are of comparatively small significance. The manner in which the right is exercised by the workers is of far greater importance.

It is no mere coincidence that, since the institution of factory councils, a new educational movement on the part of the labouring classes has developed in Germany. This movement is connected with the fact that new functions have been assigned to the factory councils, functions which can only be performed by those who possess the necessary expert knowledge. So-called "courses of instruction for councils" (*Rätekurse*) are being instituted all over Germany with the object of enabling the working classes to acquire the knowledge and capacity requisite for the fulfilment of their new duties. This educational movement is becoming more and more systematic and conscious of its own significance. At the university of Frankfort-on-Main an "Academy of Labour" has been founded, to the support of which trades unions of all kinds are contributing large sums. The object of the "Academy of Labour" is to produce a new class of leaders for the new tasks of the labour movement by means of a comprehensive scheme of education.

In this intellectual side of social politics to which the Factory Councils Law has given birth there lie the seeds of a highly important development. For social questions are not merely questions of power. The supremacy of capital over labour has not been due solely to the ownership of the instruments of production; it was, above all, based on intellectual capacity for business management and leadership. The labour movement, by striving with purpose and system to obtain the intellectual equipment which is requisite, not only for acquiring the instruments of production, but also for managing them in the way that will be most beneficial to the entire community, is taking a step forward which may be of greater significance to the economic life of the nation than any laws and schemes for socialization. It is an undoubted fact that this intellectual movement, bound up as it is with the new rights of the factory councils and with the general and fundamental principles of the councils movement, is a preliminary step in the socialistic transformation of economic life which is taking place before our eyes, although many of us may not be aware of it, or may not wish to become aware of it.

BIBLIOGRAPHY.—Information on the general questions involved is given by Anschütz in *Die Reichsverfassung* (zu Art. 165; 1921); by Sinzheimer in *Das Rätesystem. Eine Einführung in den Rätegedanken* (1920); Proceedings of the Constitution Committee of the National Assembly (1919–20). ### POLITICAL HISTORY

*From 1910 to Outbreak of World War.*—The question of reform in imperial financial system, which in 1909 led to the resignation of Prince Bülow and the appointment of Bethmann Hollweg as Chancellor, continued to exercise a predominant influence in German domestic politics until the Reichstag elections of Jan. 1912. Against the so-called "black and blue *bloc*" (the Catholic Centre and the Conservatives) which had carried the

financial reforms through the Reichstag, and of which Bethmann Hollweg was considered to be the representative, the hitherto divided Liberal Left (*Freisinnige Vereinigung*, *Freisinnige* and *Deutsche Volkspartei*) at the beginning of 1910 united to form the Progressive People's party (*Fortschrittliche Volkspartei*), which held its first party congress in March of that year. In the electoral contest of 1912 the question of Prussian suffrage reform played an important part. It was a question which was really of the first importance for the policy of the Empire on account of the predominant position of Prussia. In accordance with an undertaking which had been given in Jan. 1908 by Prince Bülow, as Prussian Minister-President, Bethmann Hollweg introduced a Government bill on Feb. 4 1910 in the Prussian Diet. This bill, however, did not provide, as had been desired in many quarters, for the application of the suffrage of the Reichstag to Prussia; on the contrary it retained the antiquated original electoral districts and the division of the electorate into three classes according to the amount of their income-tax assessments. Certain provisions of the bill were, it is true, intended to effect alterations in the distribution in the three classes of electors, and the direct method of election was to have been substituted for the system of choosing electoral colleges. After various vicissitudes, the bill was rejected by the Diet on May 27 1910. The question nevertheless continued to form a constant subject of public discussion during the ensuing years, and franchise reform constituted one of the chief demands of the parties of the Left, more especially the Social Democrats, after the World War started. The rejection of the suffrage bill led to a change of ministers in Prussia; the chief president of the province of Silesia, Dallwitz (afterwards Statthalter of Alsace-Lorraine), became Minister of the Interior, and Baron von Schorlemer-Lieser Minister of Agriculture, while the chief burgomaster of Magdeburg, Lenze, took over the Ministry of Finance. About the same time the Imperial Secretary for the Colonies, Dernburg, retired, and the under-secretary von Lindequist was appointed in his stead. Dernburg had been attacked for the favour he was alleged to have shown to the great capitalists in the exploitation of the S.W. African diamond fields, yet to him undoubtedly belongs the credit of having been the first to awaken the active interest of the nation in its colonial possessions. Shortly afterwards there was also a change in the secretaryship for Foreign Affairs, Kiderlen-Wächter having been appointed in succession to Baron von Schön, who was sent as ambassador to Paris. The St. Borromeo Encyclical of the Pope against the Reformation, which was felt in Protestant circles to involve great danger for the religious peace of Germany, threatened to cause difficulties in internal politics. A crisis was averted, however, by the Pope's disavowal of any thought of offending the non-Catholic population of Germany or the German Protestant sovereigns.

The person of the Emperor repeatedly became a central subject of discussion in the course of 1910. Excessive importance was attached to an incident of a not very serious character caused by the Conservative deputy Oldenburg-Januschau, in the Reichstag. That deputy declared in a debate on military discipline that the German Emperor must always be in a position to say to a lieutenant: "Take ten men and close the Reichstag." Although this unfortunate utterance did not deserve to be taken so seriously as it was in the press and in several of the German parliaments, it nevertheless showed the complete opposition which eight years before the revolution of 1918 existed in Germany between the different conceptions of the monarch's position. An extraordinary sensation was produced by a speech of the Emperor, who at Königsberg claimed in the following words that he held his office by the grace of God:—

"Here in Königsberg my grandfather set the crown of Prussia on his head in his own right,[1] distinctly asserting once more that it was bestowed upon him solely by the grace of God and not by parliaments, popular assemblies or popular resolutions, and that he thus regarded himself as a chosen instrument of Heaven and as such fulfilled his duties, first as Regent, and afterwards as Sovereign. Regarding myself as the instrument of the Lord, without paying attention to views and opinions of the hour, I go my own way, which is dedicated simply and solely to the well-being of the peaceful development of our country."

The Emperor, it is true, modified this utterance in a speech delivered shortly afterwards at Marienburg, declaring that the cross on the robes of the Teutonic Order, which meant its subjection to the will of Heaven, illustrated what he had said at Königsberg. "As my lamented grandfather and I," he continued, "both represented ourselves as working under the supreme protection and with the supreme permission of our Lord God, I assume the same to be true of every honest Christian whoever he be." Nevertheless an interpellation was moved in the Reichstag in Nov. on the subject of these speeches. There was also in this connexion the additional fact that the Social Democrats at their congress at Magdeburg had laid strong emphasis upon their republicanism. The Socialist party, moreover, succeeded at this congress in composing dissensions which had arisen among them on the question of voting the budget in Prussia, and they were able to maintain the unity of the party. While criticism of the Government on various matters that arose became more and more severe, an understanding with regard to the elections was effected between the National Liberals and the new Progressive People's party. It was about this time, too, that the catchword, "the *bloc* from Bassermann to Bebel," was coined.

The Bethmann Hollweg Government had managed in spite of this opposition to carry two highly important measures. One was the law coördinating the social insurance system of the Empire passed by the Reichstag on May 3 1911. By this law a work of social policy was completed which became a model for many countries. The new law extended the system of sickness and accident insurance, and further developed the insurance of invalids and surviving dependents. It granted a subvention to widows and orphans (*Reliktenversicherung*), the annual amount of which was estimated at 60,000,000 marks. Among the insured were included some 7,000,000 additional workers employed in home industries, in agriculture and in domestic service. A proposed reduction of the pension age from 70 to 65 was not carried at this time on account of the cost, which would have meant a fresh expenditure of 9,000,000 marks per annum; this reform had to wait until after the revolution of Nov. 1918, when various other bills amending the national system of insurance were carried, and the contributions, pensions, etc., were increased in accordance with the depreciation of the currency. A fundamental reconstruction of the insurance laws was contemplated for the year 1922.

Another measure of great significance was the bill for giving a constitution to Alsace-Lorraine, introduced on Sept. 23 1910, and passed, together with a complementary Franchise bill, on May 26 1911. According to this measure, the Emperor had the right to nominate, without consulting the Federal Council, the Statthalter for the Reichsland and 19 members of the First Chamber. The other half of the members took their seats partly *ex officio*, partly as the representatives of the estates of the country. Alsace-Lorraine was given three votes in the Federal Council, and its representatives on that body received their instructions from the Statthalter. In order, however, to prevent a too great preponderance of Prussia in the Federal Council, the provision was added that the three Alsatian votes should not count in cases where a Prussian proposal could not be carried without them. It was evident that, since the Emperor, who was also King of Prussia, appointed the Statthalter, and the Statthalter gave the Alsatian members their instructions, the Alsatian votes in the Federal Council in reality meant Prussian votes. For the Second Chamber of the Reichsland Parliament, universal, equal, direct and secret suffrage was granted, although it continued to be withheld from Prussia; and the anomaly was witnessed of the Prussian Minister-President, Bethmann Hollweg, advocating in the Reichstag, as Imperial Chancellor, this

[1] Only two of the Prussian Kings had been crowned: Frederick I., on Jan. 18 1701, and William I., on Oct. 18 1861. Both crowned themselves at Königsberg, the first because, as Duke, and subsequently King, of Prussia, he could assert in his eastern possessions, which were outside the Holy Roman Empire, his absolute independence of the Emperor, from whom, nevertheless, he had received permission to assume the royal dignity.

suffrage for Alsace-Lorraine. When the bill was being debated, there was a revival in Conservative circles of the old demand for the incorporation of Alsace-Lorraine with Prussia. The Chancellor met this demand by pointing out that the avowed object of Bismarck's policy was to give the people of Alsace-Lorraine a country of their own, as nearly as possible on an equal footing with the other German states and under the protection of the whole Empire. The constitution came into force on Sept. 1 1911. The first and only elections to a German Parliament of the Reichsland took place on Oct. 22 1911 and resulted in a Clerical majority. There were, nevertheless, in the sequel repeated incidents in Alsace-Lorraine, some of them in the Parliament itself. A good deal of excitement was caused in Nov. 1913 by the so-called Zabern affair, when young Lt. von Forstner—who afterwards fell in the war—employed a local term of abuse, "Wackes," to characterize the Alsatians. The consequence was that German officers were insulted by the population, and, as the civil authorities did not interfere, the regimental commander governing the garrison, Colonel von Reuter, had arrests made on his own responsibility. This incident made a very bad impression among the anti-militarist parties in the Reichstag, and led to excited debates, which were followed on April 1914 by the resignation of the Statthalter, Count Wedel. This had been preceded on Jan. 29 by the retirement of the Secretary of State of the Reichsland, Zorn von Bulach, and also of two under-secretaries. The Prussian Minister of the Interior, von Dallwitz, was appointed Statthalter. It is noteworthy that in the course of the Reichstag debates on this subject a vote of no confidence in the Chancellor was passed for the first time in German parliamentary history. The official view of parliamentary responsibility, which was strongly held by the Emperor, prevented the vote from having any further consequences.

On June 18 1911 the German nation celebrated the fortieth anniversary of the foundation of the Empire. In the course of the same year the despatch of the gunboat "Panther" to Agadir caused a highly strained European situation, attended by the greatest excitement in Germany. The so-called "*geste* of Agadir" was at first joyfully greeted by the whole of the parties of the Right, and more particularly by the Pan-German members, as a sign that Germany was determined to assert her position in the world. When, however, the Government appeared to be abandoning German interests in Morocco in exchange for compensations in the French Congo, the Secretary of State, Kiderlen-Wächter, and the minister responsible for the conduct of German policy, the Chancellor Bethmann Hollweg, were subjected to very violent attacks, with which even some of the deputies of the Left associated themselves. In the midst of this excitement the speeches of Mr. Lloyd George and Mr. Asquith in England were regarded as wounding to Germany. When the details of the Franco-German Morocco-Congo Convention, signed on Nov. 4 1911, were published, they had a calming effect upon public sentiment. Only the Pan-German newspapers continued to speak of the "disgrace" of Agadir. The Secretary of State in the Colonial Office, von Lindequist, resigned because he could not approve of the agreement. He was succeeded by Dr. Solf, who had been governor of Samoa. There was a debate in the Reichstag, lasting several days, upon the Morocco negotiations, and the Imperial Chancellor took up an attitude of vigorous opposition to the ideas of the Conservative leader, von Heydebrand. A great sensation was caused by the action of the Crown Prince, who appeared in uniform in the Court Gallery and demonstratively applauded von Heydebrand. This incident led to further parliamentary discussion. In one of the speeches which the Chancellor delivered, he declared that Bismarck's principle never to wage a "preventive" war had continued to guide the Government in the Morocco crisis. For himself he had to bear the responsibility, and it was his duty so to conduct affairs that any war which was avoidable and was not necessitated by [illegible] honour should be avoided. In another speech [illegible] Hollweg expressed his regret that von Heydebrand [illegible] language with regard to German relations with Great [illegible] might be useful at an election meeting but was not customary in a Parliament alive to its responsibility. With these proceedings the legislative period of the Reichstag which had been elected in 1907 closed.

On Jan. 12 1912, the new Reichstag elections took place, and resulted, as had been expected, in showing that the "black and blue *bloc*" (Conservatives and Catholic Centre) no longer commanded an effective majority. Although most of the by-elections in the previous year had revealed a strong movement toward the Left, the extent of the success of the Social Democrats proved extraordinary. They were sent back to the Reichstag with 110 deputies, which made them the strongest party in the House. The "black and blue *bloc*" lost 45 seats. This change in the parliamentary situation did not, under the German political system of those days, entail a reconstruction of the Government; its effects, however, were manifested at the election of the president and the vice-presidents of the Reichstag. These, according to parliamentary custom, had to be elected twice over. At the first election the veteran Socialist leader, Bebel, only missed being elected president by 11 votes, while for the first time in German political history a Socialist, Scheidemann, was elected vice-president. At the second election the Progressist (*bourgeois* Democrat) Kampf was elected president, while Scheidemann was defeated by the National Liberal, Dr. Paasche. The times were not ripe for placing Social Democrats in positions which entailed personal relations with the Court. The new Reichstag—the Reichstag which lasted throughout the war and proved to be the last under the old Imperial *régime*—was ultimately swept away together with the Bismarckian constitution by the revolution of Nov. 1918.

In Bavaria, the second largest German Federal state, elections had almost simultaneously taken place for the Diet. Their result was signalized by the appointment of the leader of the Catholic Centre in the Empire, Baron von Hertling (who afterwards became Imperial Chancellor), to the presidency of the Bavarian Ministry. An ordinance issued by this Government, permitting certain limited activities in Bavaria to the Jesuits, who had been expelled from Germany since 1872, led to much discussion, which was also taken up in the Reichstag. In consequence of the decision of the Federal Council, Bavaria withdrew this Jesuit ordinance in Nov. 1912. New army and navy bills, providing for the establishment of two new army corps at Allenstein and Saarbrücken and contemplating the completion of the third squadron of battleships for the fighting line, involved measures for meeting fresh expenditure, in connexion with which the Secretary of State of the Imperial Treasury, Wermuth, resigned. He was succeeded by the under-secretary Kühn, and was elected a few months afterwards to the office of chief burgomaster of Berlin. As a presage of what was afterwards to take place it may be noted here that there was already a Social Democratic majority in the Diet of the smallest of the federated states, Schwarzburg-Rudolstadt.

On Dec. 12 1912, the Prince Regent Leopold of Bavaria died at the age of 92. He had governed in place of the incurably insane King Otto since 1886. He was succeeded as regent by his son Prince Louis (Ludwig), and in the following year (1913) the Hertling Ministry introduced an amendment to the constitution providing that if the king was unable, owing to bodily or mental infirmity, to exercise his office, and if, after a period of 10 years, there was no prospect of his recovery, the regent should declare the throne vacant. The Bavarian Diet agreed on Oct. 30 1913 to this alteration of the constitution, and the regent assumed the Bavarian crown as King Louis (Ludwig) III. In another state of the confederation, Brunswick, the regency which had lasted for many years was also terminated in 1913. The legitimate heir was the Duke of Cumberland, son of the King George of Hanover who had been deposed in consequence of the events of 1866. The Duke of Cumberland had expressly refused in 1884 to renounce his right to succession to the throne of Hanover. By decisions of the Federal Council in 1885 and 1907 he was accordingly debarred from taking up the succession to the ducal throne of Brunswick. It was only the marriage of his sole surviving son, Prince Ernest Augustus, with the daughter

of the German Emperor, Princess Victoria Louise, that put an end to these difficulties. The marriage was celebrated at Berlin on May 24 1913 with great splendour, and a large number of European sovereigns and princes were present. Among them were the King and Queen of England and the Tsar of Russia. Prince Ernest Augustus, who had previously entered the Prussian army, had on April 20 addressed a letter to the Imperial Chancellor intimating that his father had transferred to him his rights to Brunswick; further, that his marriage with Princess Victoria Louise and his entrance into the Prussian army would, in his view, justify a reversal of the former decision of the Federal Council concerning the Brunswick succession. On the proposal of Prussia the Federal Council then declared (Oct. 27) that it agreed to the prince's accession to the throne of Brunswick. The young Duke and Duchess of Brunswick were, therefore, able to make their state entry into Brunswick on Nov. 3. The fact nevertheless had a sequel. Attacks were made in the Reichstag on the Federal Council because it had given its consent to the accession of Prince Ernest Augustus without the renunciation of the throne of Hanover by his father, the Duke of Cumberland, which it had demanded in the year 1907. The German Crown Prince in a correspondence with the Imperial Chancellor associated himself with this protest, a proceeding which caused some transient annoyance. Meanwhile, the Hanoverian Guelphs turned the settlement of the Brunswick succession to account by advancing in the most uncompromising manner demands, which since 1866 they had never abandoned, for the reëstablishment of the Guelph kingdom of Hanover.

The Secretary of State for Foreign Affairs, von Kiderlen-Wächter, suddenly died on Jan. 2 1913. He was succeeded by the ambassador in Rome, Gottlieb von Jagow. On Jan. 29 the chief in command of the High Seas Fleet, Adml. von Holtzendorff, was placed on the retired list and was succeeded by Adml. von Ingenohl. The danger of war, which had again overshadowed Europe, and more especially Germany's ally, Austria, in consequence of the Balkan War and the Russo-Austrian tension, caused the German Government to introduce the great Army Bill of 1913, to meet the cost of which a non-recurring war contribution (*Wehrbeitrag*) was to be levied upon the well-to-do sections of the nation. The Imperial Chancellor introduced the bill on April 7 in a great speech, in which he referred to the change in the military and political situation resulting from the issue of the Balkan War. "If ever," he said, "there should be a European conflagration in which Slavs and Germans were opposed, a disadvantage for the Germans would lie in the fact that the place in the balance of power hitherto occupied by European Turkey would now to some extent be occupied by the South Slav states." After alluding to the growth of Pan-Slavic tendencies, to the literature of Chauvinism in France, and to the fact that in Germany, as contrasted with France, the idea of universal service was no longer completely carried out, the Chancellor declared:—"We are not bringing in this bill because we want war, but because we want peace, and because, if war comes, we desire to be the victors." The bill raised the strength of the German army, as from Oct. 1 1913, from 544,271 men to 661,176. It passed the third reading in the Reichstag on June 30 1913. The financial measure accompanying it, defraying the proposed expenditure to the amount of more than one milliard marks by a non-recurring war contribution levied upon personal fortunes, was passed at the same time. The bill for this impost, which in the ensuing years—indeed for the most part in the first year—was paid up without any disturbance of the economic life of Germany, was the work of the Secretary of State for the Treasury, Kühn. The sovereigns of the German Confederation renounced their privilege of exemption from taxation and paid their share of this contribution on behalf of the national defences. As regards the construction of warships, the Secretary of State for the Navy, von Tirpitz, had stated in the Reichstag on Feb. 7 that he had no objection to the proportion of 10 to 16 between the numbers of the German and the English battleships, as proposed by the British First Lord of the Admiralty.

The remarkable progress of the German nation up to 1913–4 was advertised in a striking way by the great celebrations of 1913, the centenary of the War of Liberation, and the twenty-fifth anniversary of the accession of William II. All the German sovereigns assembled to take part in a ceremony in the hall built at Kehlheim to commemorate the national liberation, and in the dedication of the monument erected at Leipzig in memory of the "Battle of the Nations" (*Völkerschlacht*). On the occasion of the *fêtes* celebrating the Kaiser's accession, there were many references to the industrial, economic and financial prosperity which had been achieved. Dr. Helfferich calculated that the national wealth of Germany amounted at that date to something like 300 milliard marks (about £15,000,000,000). The population, according to the census of 1910, was 64,896,881. Nevertheless, Germany had one constitutional weakness which was a flaw in its prosperity. The World War came upon it at a stage of its internal political development when it had not yet succeeded in readjusting the rights and duties of the various factors in the life of the state, in the sense of a compromise, such as the times demanded, between monarchy and parliamentary democracy. In the very centre of this political struggle, which had been going on for many years, stood the question of the suffrage for the Prussian Diet. The Social Democrats, almost exactly one year before the outbreak of the World War, lost on Aug. 13 1913 by the death of August Bebel their veteran leader in the struggle for the democratization of Germany. His successor in the presidency of the party organization was the man who was destined subsequently to be the first president of the Republican Reich, Ebert. (O. B.)

*The War Period.*—The prosperous development which Germany had experienced for more than 40 years of peace had been both politically and economically a mighty one; and there had arisen in the German people a profound sense of their strength, based in great part upon the absolute confidence which they felt in their military power. This confidence continued to influence popular feeling during the first years of the war. The events which led up to it, the crime of Sarajevo, the Austrian ultimatum to Serbia, the preparations for war in Russia, were followed throughout the country with earnest attention, but until the end of July 1914 there was scarcely any sign of satisfaction among the German people at large at the prospect of war. It was only when it became known that there was no hope of avoiding the conflict that any national enthusiasm for war suddenly broke out and communicated itself to all sections of the people. It found expression in lively demonstrations. Characteristic of the state of public feeling were the words which the Emperor addressed from the balcony of Berlin Castle to the assembled masses below:—"I no longer know any parties among my people; there are only Germans." The necessity of setting aside all party strife was felt from the extreme Right far into those working-class circles which, as belonging to the Social Democratic party, had hitherto been opposed on principle to war. On Aug. 1 1914 the Socialist leaders had issued a manifesto exhorting their followers to persist in their confidence that the future, in spite of everything, belonged to Socialism as the great bond between the nations. Indeed, if the Social Democrats had frankly taken up an attitude of opposition to the war, the masses, even those who belonged to the party, would in their patriotic enthusiasm have declined to follow their lead. The appeal by the Kaiser to his people on Aug. 6, the manifestos of the different German sovereigns, the Emperor's speech from the throne on Aug. 4, and the speech of the Imperial Chancellor Bethmann-Hollweg on the same day, awakened an accordant response from the nation. On Aug. 4 the Social Democrats joined with the rest of the parties in the Reichstag in voting the first war credit of 10 milliard marks. A united front of all parties was established.

And now the events of the war followed each other in rapid succession. The overrunning of Belgium by the German troops and the victory of Hindenburg over the Russians at Allenstein produced a whirlwind of victorious exultation. On Sept. 9 the Socialist leaders published a protest against the anti-German attitude of the International Socialist Bureau, and thus drew a clear line of cleavage between the German Social Democracy and

that of enemy countries. On Dec. 2 a second war credit was voted by the Reichstag. In this instance the express assent of the Social Democrats was given, and their then leader, Haase, explained in a long speech the reasons for their attitude. The feeling in Germany was everywhere the same; victory was believed to be certain; even the unfavourable issue of the battle of the Marne, the fall of Tsing-tau and the destruction of the German cruiser flotilla off the Falkland Is. did nothing to impair this conviction. Although the participation of England in the war was keenly felt, the unquestionably great military successes of Germany in 1914 dispelled any apprehensions that the nation might not be strong enough to face its enemies.

The beginning of 1915 brought no alteration in this respect. In March the Social Democrats, by the mouth of their leader, Haase, expressed in the Reichstag the gratitude of the country to the German troops for their valour. At the same time the Government did its best to meet the Social Democrats halfway by fulfilling demands which that party had hitherto preferred in vain. The Secretary of State for the Interior, Dr. Klemens Delbrück, indicated in the Reichstag that new lines of policy were to be adopted; the question must be considered to what extent the great events which were taking place confronted the Empire with the necessity of meeting legitimate desires of the Left. In Aug. the president of the Reichstag, Dr. Kampf, intimated that the Government had abandoned its opposition to the proposal to place the inscription "To the German People" on the place long reserved for it on the Reichstag building.

In May Italy entered the war, an event which had long been foreseen and therefore did not exercise any very depressing influence. In certain circles a feeling nevertheless began to gain ground that, in view of the steady increase in the number of Germany's foes, the prospect of victory was becoming more doubtful. The Government did its best to repress this feeling. On Aug. 19 1915, the Chancellor, Bethmann Hollweg, delivered a speech in the Reichstag directed chiefly against England, and culminating in the prediction that the numbers, the powers, the wealth and the malice of Germany's enemies would be shattered against the iron determination of the German race. Once more the Reichstag, including the Social Democrats, voted a war credit, but this time one Socialist vote, that of Dr. Liebknecht, was recorded against it. Gradually, however, the Social Democrats began to give expression to aspirations for peace. As early as Nov. 1915 the Social Democratic leader, Scheidemann, addressed a question to the Government regarding the possibility of concluding peace. And now for the first time a Socialist group of 18 deputies, under the leadership of the deputy for Leipzig, Geyer, voted against a fresh war credit, although the Socialist Dr. Landsberg still protested in the most emphatic manner against any surrender of German territory. A division in the ranks of Social Democracy began. A sensation was caused by the publication of a peace manifesto issued by the German Social Democratic minority in the Paris newspaper *Humanité*.

This was vigorously repudiated by the Socialist majority. On July 19 Haase, Bernstein and Kautsky published in the *Leipziger Volkszeitung*, under the title "A Necessity of the Hour," a declaration in favour of the early conclusion of peace. The official leaders of the Social Democratic party issued, it is true, a counter-declaration, but in this document it was acknowledged for the first time that the Government must be ready for peace negotiations if a suitable opportunity offered. The chief party organ, *Vorwärts*, which published this counter-declaration, was temporarily suppressed by the Government. Thus there arose between the Social Democrats and the Government a discordancy which gradually extended among the masses. All the non-Socialist parties identified themselves in this instance with the attitude of the Government. Another element in the situation was that in Prussia there was a campaign going on for the reform of the suffrage, demanded by the Social Democrats but somewhat peremptorily refused by the Prussian Ministry. The bombing of Freiburg in Baden by enemy airmen, causing the death of eight persons, and the similar fate of Karlsruhe, where 27 persons were killed and 57 wounded, helped, no doubt, to revive popular feeling against the Entente and against the idea of peace. Nevertheless, a sense of war-weariness became more and more apparent and began to spread even in non-Socialist circles.

This change of feeling was above all due to the increasing difficulties in providing the masses with food. The severance of all communications between Germany and foreign countries prevented the importation of raw materials and foodstuffs of every kind. Although, at first, raw materials, sometimes in large quantities, could be imported through Holland, Switzerland and Sweden, these supplies gradually diminished as scarcity began to be felt in those countries. As far back as the beginning of 1915 the German Government was compelled to adopt measures for securing a supply of food for the whole population. All grain and flour were sequestrated on Feb. 1 1915. A system of bread cards was introduced for a ration of 200 grammes of bread per head of the population. It was further decreed that the bread should be baked with an admixture of substances like potato-flour. On June 29 1915 a Grain Office for the Empire was instituted and took over the whole traffic in grain; and on July 23 a similar department was set up for providing fodder for animals. A prohibition was issued against feeding cattle with rye or wheat. As it was at first impossible to enforce this prohibition by a system of minute surveillance, an order was issued that one-third of all the swine should be slaughtered. The lack of petroleum made itself felt, especially in the rural districts which had no other means of lighting. Illicit traffic in the kinds of goods that were under Government control began to spread, and profiteers raised prices far above real values. The Government was, therefore, compelled to adopt measures for preventing profiteering on the necessities of life. Maximum prices for petroleum were fixed in July 1916, and in Oct. of the same year for butter and potatoes. On May 22 1916 a War Food Office was established, with the former chief president of E. Prussia, von Batocki, at its head. The bread card was supplemented on Oct. 2 by a meat card allowing 250 grammes of meat weekly per head of population.

From Nov. 1 1916 meat might be obtained only on Tuesdays and Fridays. Milk was also rationed, in order to assure a supply for infants and young children. The municipalities and communes made arrangements for supplying food to indigent persons; in the large towns popular kitchens were established which provided a meal at a low cost. The pupils in the schools were instructed to collect remnants of food and kitchen-refuse to supplement the fodder for cattle. The older pupils volunteered to go into the country and bear a hand in the harvest. Materials for clothing gradually began to be scarce. In July 1916 a Clothing Office for the Empire was instituted, and everyone who wanted to buy an article of wearing apparel had to apply to it for a permit; without the production of this purchase certificate no article of wearing apparel could be sold. German scientific experts were meanwhile doing their best to devise substitutes for articles of which there was a scarcity, and these efforts led to many new inventions.

The provision of financial resources for the prosecution of the war and for other public requirements presented a special problem. While Great Britain met her war expenditure in the main by increasing the tax revenue and issuing short-dated loans, Germany adopted from the first the method of issuing long-dated war loans. At the beginning of the war the Secretary of State Kühn was in charge of the finances of the Empire; he resigned in Jan. 1915 and was succeeded by Dr. Helfferich, who at a later date became the leader of the German National party (the Conservative Right). In May 1916 Dr. Helfferich succeeded Dr. Klemens Delbrück as Secretary of State for the Interior, and was himself succeeded in the Department of Finance by Count Rodern, hitherto Secretary of State in Alsace-Lorraine. The method of providing money remained the same throughout the war. The loans were employed not merely for meeting expenditure but also for meeting interest due upon previous loans. The result was a very rapid increase of the public debt, which by 1918 had reached the amount of nearly 102 milliard marks.

Altogether nine war loans were issued. The first (Sept. 1914, issue price 97·5%) produced 4,491,861,000 marks; the second (March 1915, issue price 98·5%) 9,106,394,700; the third (Sept. 1915, issue price 99%) 12,161,630,100 marks; the fourth (March 1916, issue price 95%) 10,767,598,000 marks; the fifth (Oct. 1916, issue price 95%) 10,651,726,200 marks; the sixth (April 1917, issue price 95%) 13,122,000,000 marks; the seventh (Sept. 1917, issue price 95%) 12,626,000,000 marks; the eighth (April 1918, issue price 95%) 15,001,000,000 marks; the ninth (Nov. 1918, issue price 95%) 10,443,000,000 marks. Beginning with the sixth war loan a system of periodical drawings was introduced in order to attract subscriptions. This method of meeting financial necessities was maintained until almost the end of the war, when it became manifest that the increased burden of interest was becoming gigantic. It is true that in 1916 and 1917 new measures of taxation were passed by the Reichstag, but the yield of this taxation was inconsiderable. By 1918 the estimates had grown to over 7½ milliard marks, or almost 3 milliards more than in the previous year. The necessity of imposing fresh taxation was manifest, and the Reichstag adopted measures for this purpose in April 1916. The new taxes were estimated to produce a revenue of 3,179,000,000 marks. They were as follows:—a monopoly in spirits, to be administered by a Central Spirit Office, to which all the spirit manufactured by the distillers was to be delivered; an increase in the duty on beer; an increase in the duty on wine, amounting to an additional 20% of its value; an increase in the duty on sparkling wine of three marks per bottle; a duty on mineral waters and manufactured non-alcoholic drinks; a duty on coffee of 130 marks per 100 kgm.; a duty on tea of 230 marks, and on cacao and chocolate of 140 marks per 100 kgm.; an increase in the postal and telegraph tariffs; a war duty ranging from 10% to 50% on increased profits of companies; a stamp duty of four-tenths per thousand for ordinary stock, two-tenths on war loan and seven-tenths on foreign stock; further an increase of the duty on bills of exchange and money transactions (*Geldumsätzen*); a duty of 5 per mille on sales; a luxury tax on precious metals, jewels, works of art, antiquities, carpets, furs, pianos, fire-arms and motor vehicles. Simultaneously a law dealing with the evasion of these as well as previous forms of taxation, and imposing severe penalties, was passed. Further, a tax upon excess of income beyond the amount of the last pre-war assessment was enacted, with the object of confiscating a considerable part of war profits. These new measures of taxation did not succeed in putting the finances of the Empire upon a sound basis, as they could no longer be properly administered. After the close of the war, in consequence of the Revolution and the reparation payments imposed upon Germany, the national finances fell more and more into a state of complete disorder.

From the beginning of the year 1916 war-weariness was becoming more and more prevalent among the people, and the attempts of the Government and the press of the Right to fight it were unsuccessful.

A conflict arose between the navy administration and the Government of the Empire regarding the adoption of an intensified form of the U-boat warfare, and this conflict cast its shadow upon the whole of political life and formed the subject of violent debate in the press. In March 1916 the two conservative parties in the Reichstag tabled a resolution to the effect that complete freedom in the use of the U-boat weapon should be reserved in any negotiations with other Powers. Ultimately a compromise was effected in favour of another resolution, which declared:—"Seeing that the U-boat has proved an effective weapon against the British method of waging war with the object of reducing Germany to starvation, the Reichstag expresses its conviction that it is imperative to make such use of the U-boats as will assure the achievement of a peace giving security for the future of Germany." The Social Democrats voted in favour of this resolution with the exception of the Minority group of 18 deputies, to whom it gave the signal for separating themselves from the Social Democratic party in Parliament and forming a separate party under the name of *Sozialdemokratische Arbeitsgemeinschaft*. It was out of this group that at a later date the party of the Independent Socialists sprang.

On April 5 1916 the Imperial Chancellor delivered a speech in the Reichstag describing peace negotiations as out of the question so long as on the British side the object of the war continued to be the destruction of Germany. In describing the objects of Germany the Chancellor said that peace could only be concluded on the basis of the results of the war. Poland therefore could not be handed over again to Russia; the Polish question must be solved conjointly by Germany and Austria. On the German eastern frontier securities must be demanded against any repetition of the Russian attack. Belgium must not become a British vassal state, and must be economically joined up with Germany. In the Reichstag the speech was received with strong demonstrations of approval. It did not, however, succeed in uniting the nation afresh in a vigorous determination to prosecute the war to a successful conclusion. A similar fate attended later speeches which the Chancellor delivered in the Reichstag in Sept. and Nov., and in which, among other things, he said:—"A statesman who hesitated to employ against the enemy any effective instrument of warfare which is really calculated to shorten the war would deserve to be hanged." The dissensions between the Right and Bethmann-Hollweg became more and more acute. He was reproached with watering down the war aims and of having too little backbone when confronted with the pressure of the Left for a democratization of the Government. The Social Democrats on the other hand, and gradually also the *bourgeois* Democrats and the Catholic Centre, demanded from the Chancellor unequivocal assurances that the Imperial Government was prepared to conclude peace on an acceptable basis, and in particular to renounce all annexations and war indemnities. The Chancellor himself was inclined to yield to this pressure, but he encountered vigorous opposition from the Chief Command of the army, where General Ludendorff in particular advocated the principle that Germany could not conclude a peace which did not compensate her in the fullest degree by annexations and indemnities for the sacrifices she had made in the war. The Chief Command even went so far as to try to influence the policy of the Government, and Bethmann-Hollweg was not the kind of man resolutely to repel these endeavours. There gradually arose a situation in which the Chief Command actually acquired a real influence on the policy of the Empire. The result was that the Chancellor found himself in an ambiguous position in dealing with the demand of the Majority of the Reichstag for an unequivocal demonstration of the German desire to make peace. At this stage the Catholic Centre deputy Erzberger became more and more prominent as the champion of the views of the Majority, so that ultimately two strongly contrasted groups were formed, the Minority on the Right which represented the views of the Chief Command, and the Majority, composed of the Catholic Centre, the *bourgeois* Democrats and the Social Democrats, who pressed for an acceptable peace. In addition to these there arose on the extreme Left a small but very active group which put itself in the most uncompromising opposition to the Imperial Government and from 1916 onwards voted against all war credit. The leaders were the deputies Haase (the former president of the Social Democratic party), Dittmann, Geyer and Ledebour. As already mentioned, 18 deputies of this colour seceded on Jan. 12 1916 from the Social Democratic party. The deputies Liebknecht and Ruhle, who were still further to the Left, did not join this new extremist group, because it did not go far enough for them. In Sept. 1916 the Congress of the Social Democratic party of the whole Empire adopted a resolution which, while laying stress on the duty of defence, rejected the idea of a war of conquest and advocated reestablishment of international relations.

The position of the Chancellor was rendered still more difficult by fresh and much more violent attacks upon him from the Right. He found it necessary to repel these attacks in very strong language in a speech which he delivered in the Reichstag. The worst of these attacks was a pamphlet directed against the Chancellor, which was published under the *nom de guerre* of

"Junius Alter" and had a large circulation. About the same time the director of the E. Prussian Credit Institute, Kapp (destined in 1920 to become celebrated as the perpetrator of the "Kapp *Putsch*"), published a denunciation of Bethmann Hollweg under the title of *Die Nationalen Kreise und der Reichskanzler*. The Chancellor's language in the Reichstag was so vigorous and contemptuous that Kapp sent him a challenge to a duel, which the Chancellor did not accept. There were a number of other similar incidents. Prof. Cossmann of Munich published violent attacks against Prof. Valentin of Freiburg, whom he charged with having obtained by theft material which he had used for an article on the number of vessels which had been sunk by the U-boats. Grand Adml. von Tirpitz intervened in this controversy. On June 28 1916 the Reichstag deputy Liebknecht was condemned to two-and-a-half years' penal servitude for having caused a popular demonstration in the Potsdamerplatz in Berlin, by a violent speech against the prolongation of the war. The constantly increasing influence which the Social Democrats were acquiring was shown by the action of the Government in conceding two of their demands: the prohibition of the use of foreign languages at political meetings was abolished, and the participation of young persons in assemblies arranged by the trade unions was now permitted.

The food situation had become considerably worse in the course of 1916. In Jan. of that year further restrictions had to be imposed upon traffic in winter corn and in groats for fodder. Maximum prices were fixed for artificial manures. Restrictions were placed upon the use of barley for brewing. In the following April the State took possession of coffee, tea and the substitutes (*Ersatz*) for them. Soap was rationed—600 grammes monthly per person. The consumption of meat in restaurants was restricted. In Feb. all materials for clothing and all ready-made clothes were seized by the Government. In Dec. the boot and shoe trade was subjected to the authority of the Department for Wearing Apparel. In April 1917 an order of the Federal Council limited the supply of paper for printing. In consequence of the bad harvest a great part of the milch-cows had to be slaughtered by order. The employment of substitutes (*Ersatzmittel*), the artificial production of albuminous foods, the manufacture of textile fabrics from nettle fibre and so forth, failed to make up for the deficiency in the real articles. On Nov. 25 Gen. Groener was entrusted with the charge of a department for providing for the efficiency of the economic and industrial equipment of Germany. A special law (*das Hilfsdienstgesetz*) enacted that all males between the ages of 17 and 60 should be compelled to work. Field-Marshal von Hindenburg issued an appeal for providing the munition workers with a better supply of food fats, whereupon the agricultural interest started a "Hindenburg Donation" movement for the purpose.

The opposition, which had gradually been gathering strength during 1916, was intensified early in 1917. On Feb. 1, Bethmann Hollweg announced to the Central Committee of the Reichstag the intention to prosecute the unrestricted submarine offensive, and, in view of the attitude of the United States of America, he defended this policy in a further detailed statement at a full session of the Reichstag on Feb. 27. The naval administration laid before the Reichstag certain calculations on the strength of which it was asserted that England would only be able to hold out against the submarine warfare for a few months. The Reichstag did not take up any definite standpoint in regard to the question, although the members of the different parties who spoke did not oppose the submarine warfare. Among the Social Democrats, the Democrats and the Catholic Centre party, however, a feeling was gradually gaining ground that tended more and more to emphasize the necessity for peace, and Bethmann Hollweg was reproached with being under the influence of the Supreme Military Command and with coöperating in the latter's war policy. On May 15 this feeling culminated in an important debate in the Reichstag on the subject of Germany's war aims. In a speech which gave rise to lengthy discussions, the Chancellor summarized these to the effect that a binding statement in detail of Germany's war aims would be injurious to the interests of the nation at that moment; that he would not permit himself to be influenced by any party, but would be guided solely by the consideration of the interests of the whole nation; that if Russia—the Tsar's Government having been overthrown on March 16 by the Russian Revolution—wished to conclude peace with Germany, Germany would make no demands incompatible with the liberty and welfare of the nations. In the course of the debate which followed, Scheidemann, the leader of the Social Democrats, vigorously attacked the war aims of the Pan-Germans, and said that if the Government continued to pursue such aims Germany itself would soon be faced by revolution. The speaker on behalf of the Central party, Dr. Spahn, also voiced the longing of the German people for peace, and emphasized the necessity of sincere coöperation between the Kaiser and his people. The Reichstag was then adjourned until July 6. When it reassembled on that day the strength of the feeling against Bethmann Hollweg had become more ominous than ever. The predictions in regard to the submarine warfare had not been fulfilled. America had entered the war, and the prospects for Germany were constantly becoming more and more gloomy. Deputy Erzberger had constituted himself leader of the opposition against the Chancellor, and on July 6, at a meeting of the Central Committee of the Reichstag, he disputed the possibility of bringing the enemy to terms by means of submarine warfare. Erzberger demanded the immediate initiation of negotiations for peace, on the ground that Germany's military situation would not be so favourable at a later date and that it was still possible to make an offer for peace which would have the prospect of obtaining a result favourable to Germany. The Social Democrats and the Democrats supported Erzberger, the former mainly with the object of demanding guarantees that would safeguard the influence of Parliament on the development of the political situation. Long and continuous conferences between the Chancellor and the party leaders ensued. Hindenburg and Ludendorff came to Berlin in order to intervene, but Bethmann Hollweg succeeded in preventing their being received by the Kaiser. The Crown Prince also came to Berlin and had consultations with members of the Reichstag. The Conservatives declared that they did not consider Bethmann Hollweg to be the right man to conduct German policy at this crisis. The Catholic Centre, the Democrats and the Social Democrats were united in working for his fall; and finally, Dr. Stresemann, who, owing to the severe illness of the leader of the National Liberals, Bassermann, was at the head of that party, declared that the National Liberals also had no further interest in his continuance in office. Bethmann Hollweg, however, did everything in his power to retain his position. He even persuaded the Kaiser to issue a declaration on July 11 in which a promise was made to carry out the franchise reform in Prussia which had long been demanded by the Left, and to conduct the next Prussian general election on the basis of this reform; the declaration entrusted the execution of these measures to the Chancellor.

But this final attempt to regain the support of the Left also failed. On the same day, July 11, the Bavarian minister-president, Count Hertling, was summoned to Berlin, and negotiations were conducted with him regarding his succession to the Chancellorship. Hertling, it is true, declined. Nevertheless, Bethmann Hollweg's day was over. On July 14 he tendered to the Kaiser the resignation of the Cabinet, and that resignation was accepted. Dr. Michaelis, who was at that time commissioner of state at the Food Department of the Empire, and who was regarded as an extremely capable official but had hitherto played no part in political life, was appointed as his successor. Michaelis was in general sympathy with the Conservative party. The press received the news of his appointment with marked reserve, as did also the Reichstag.

The new Chancellor was at once confronted with a difficult situation. The Catholic Centre party, the People's party and the Social Democratic party had agreed among themselves on a resolution in favour of peace, which they brought before the Reichstag on July 19 1917. This resolution proposed that a declaration be issued by the Reichstag to the effect that it

desired to bring about a peace by agreement, which should be incompatible with acquisition of territory by force and with political, economic or financial measures of coercion. The declaration further condemned economic blockades and the creation of enmity between nations, and demanded that the "freedom of the seas" should be secured, and that the readiness of Germany to promote the organization of international law should be manifested. So long as the enemy Governments refused to entertain a peace of this kind the German people would resolutely stand together like one man and fight for their right of existence and development. The new Chancellor, Dr. Michaelis, declared, on the subject of this peace resolution, that Germany had only gone to war under compulsion, and that she would not continue to fight a day longer merely for the sake of making conquests by force of arms. He hoped to be able to achieve the aims of Germany within the four corners of the Peace Resolution "as he understood it." The Chancellor further expressed his readiness to appoint men who enjoyed the confidence of the principal parties to leading positions in the Government. His words, "As I understand the resolution," gave rise to lively discussions in the press and contributed to the immediate creation of a hostile feeling against Dr. Michaelis among the parties of the Left. The Chancellor himself modified the effect of his saving clause by stating that, in using it, he had had no intention of putting himself in opposition to the Peace Resolution of the Reichstag. The Resolution was passed by 216 votes against the 126 votes of the Right and the Independent Socialists, who were joined by a few members of the Catholic Centre party. Michaelis arranged for the Kaiser to meet a number of members of the Reichstag. This meeting took place at a social gathering at the official residence of the Secretary of State Helfferich, at which the Kaiser was present. This was doubtless the first occasion on which the Emperor William came into personal contact with the leaders of the Social Democratic party; among those present were Ebert, David and Scheidemann.

On August 5th Michaelis's new Cabinet was formed. Dr. Helfferich became Vice-Chancellor, vacating the Secretaryship of the Interior. A new economic department was detached from the Department of the Interior and entrusted to the burgomaster of Strassburg, Schwander. The chief burgomaster of Cologne, Wallraf, became Secretary of State for the Interior. The chief government president of Pomerania, von Waldow, was placed at the head of the War Food Department, with the Social Democratic trades union leader, August Müller of Hamburg, as his under-secretary. Von Krause became Secretary of State for the Department of Justice, and von Kühlmann, at that time ambassador at Constantinople, became Secretary for Foreign Affairs. The National Liberal deputy Schiffer, was appointed under-secretary of state to the Treasury. Maj.-Gen. Scheuch was made head of the War Ministry in the place of Gröner. Simultaneously with the reconstitution of the Cabinet of the Empire, that of the Prussian Government took place, from which the Ministers von Lobell, Beseler, von Trott zu Solz, von Schorlemer and Lentze, who were opposed to the introduction of universal suffrage, had resigned. The leader of the Catholic Centre, Dr. Spahn, was appointed Minister of Justice; Dr. Schmidt, up to that time ministerial director in the Ministry of Public Worship and Education, became Minister; the Minister of Agriculture was Landeshauptmann von Eisenhart-Rothe; Minister of Finance, Government President Dr. Hergt.

From the first the parties of the Left severely criticized these appointments on the ground that the desired parliamentarization of the Government had not been sufficiently carried out by them. The Social Democrats in particular immediately dissociated themselves in the most vigorous terms from Dr. Michaelis, and he found but few supporters either in the Progressist or the Catholic Centre parties. The adjournment of the Reichstag, however, gave Dr. Michaelis some respite. No actual crisis occurred until Oct. when the Reichstag reassembled. Early in 1917 there had been a case of mutiny in the navy. In the course of an inquiry into this case it had transpired that the mutineers had, previously, had dealings with the deputies Haase and Dittmann, members of the Independent Socialist party, and that these politicians had advised them "to be extremely prudent." Michaelis mentioned the matter in his speech in the Reichstag on Oct. 9, making it the text for a bitter attack on the Independents in the Reichstag, who, he said, had overstepped all permissible bounds because their aims were such as to endanger the existence of the Empire. The Secretary of State for the Navy, von Capelle, seconded the Chancellor's attacks. This parliamentary action against the Independent Socialists, which had not been very skilfully managed by Michaelis, as there existed no definite material for the prosecution of the deputies Haase and Dittmann, created an unfavourable impression among the Right also, as deputies on that side of the House considered that the disclosure of the fact of the mutiny had seriously damaged the prestige of the German navy. Michaelis himself ultimately realized that, under such circumstances as these, he could no longer remain in office, and he resigned.

On Nov. 2 the President of the Bavarian Ministry, Count Hertling, for many years leader of the Catholic Centre in the Reichstag, was appointed as successor. Hertling, who was over 70 years of age, was regarded as a man of diplomatic talent; his long parliamentary experience was in his favour, so that he entered upon his new duties with good prospects of success. He at once discussed the Government programme in detail with the different political parties and agreed to undertake the further development of the parliamentary system. He immediately confirmed this promise by appointing the leader of the Progressist People's party, von Payer, to replace Dr. Helfferich, who had retired as Vice-Chancellor. The leader of the National Liberal party in the Prussian Diet, Professor Dr. Friedberg, was similarly appointed vice-president of the Prussian Ministry. At the end of Nov. the Secretary of State of the Economic Department, Schwander, retired, and the under-secretary, Stein, was appointed in his stead. Hertling further made a number of concessions to the Social Democrats, such as the institution of Chambers of Labour and an extension of the trade-union right of combination to political associations. On Nov. 29 Hertling laid his programme before the Reichstag. He emphasized the fact that Germany's war aims were confined to defending the Fatherland, preserving her territories intact, and maintaining the freedom and independence of her economic existence. He gave proof of his endeavours to obtain peace by referring to the answer given to the Pope on November 19th in reply to his transmission of an alleged overture for peace, a reply in which Germany's readiness to enter upon peace negotiations was expressed. Hertling closed with the exhortation: "Wait, endure and persevere." He managed to avoid any collision with the various political parties, so that he soon gained their confidence, and by the end of 1917 stable conditions had once more been established in the Government of the Empire.

On July 24 1917 there died Ernst Bassermann, for many years the leader of the National Liberal party. On Sept. 2 a number of leading personalities founded the German *Vaterlandspartei*, with Duke Johann Albrecht of Mecklenburg as hon. president and Admi. von Tirpitz in charge of the practical conduct of the party. The programme of this party was to stand above all parties and to unite within itself members of any of them. Its purpose was to strengthen the resolution of the people and to leave nothing undone in order to create the conditions necessary for perseverance to the bitter end. Internal politics were not to be its business: nevertheless it was precisely in this sphere that it was destined soon to exercise a determining influence. It became the centre of all those who attempted to infuse into the people a spirit of victory and to oppose in the most resolute manner all thoughts of a disadvantageous peace. At first certain members of the Social Democratic party had joined the *Vaterlandspartei*; but soon the Social Democrat press opened the most vigorous campaign against it, charging it with wrecking every chance of peace. Then developed a bitter struggle which soon played a large part in the various German Parliaments and in the widest public circles. The *Vaterlandspartei* had large funds at its disposal, conducted far-reaching propaganda, and

soon had vast numbers of members. Its activities produced no solid results in political life, but rather had the effect of further embittering internal struggles.

During 1917 food difficulties increased to an almost incalculable extent. Even rye for making bread became scarce. War bread steadily deteriorated in quality through the admixture of substitutes. Gradually a state of insufficient nutrition became prevalent among the entire populace and caused particular suffering to children and the aged. The winter of 1917–8 was popularly called the "swede winter," for lack of potatoes and meat made swedes a chief article of diet. In all the great cities soup-kitchens were established, partly from communal and partly from charitable funds, in order to offer to the poorer classes at least the possibility of obtaining meals which were at all adequate. Popular anger was directed especially against food profiteering, which assumed great dimensions. All legislative attempts to remedy this evil failed, because the cunning of the profiteer found ever new ways and means of evading the meshes of the law. In many places there were food riots, which were also directed against certain parts of the agricultural population, who tried to sell food at the highest possible prices. Regular centres of the profiteering trade arose, in which everything that was wanted could be obtained, though at enormously high prices; while trainloads of food and other necessaries were diverted or even stolen in transit in order to find the articles for this illegal traffic. It was in vain that specially instituted war-profiteering offices strove everywhere to put a stop to this trade; it remained impossible to eradicate it. The whole community of swindlers, too, profited by this state of affairs. The prosecution of a certain Frau Meta Kupfer, which came before the courts at Berlin in July, was a characteristic example. This woman had obtained loans all over the town, for which she often paid 100 per cent or more, alleging that she made enormous profits with these sums in the (illegal) food traffic. In reality she spent the money on a life of luxury, and paid interest out of fresh loans which she raised. She accumulated many millions of marks before the edifice of fraud which she had erected collapsed. The lack of food caused particular suffering to the labouring classes. Following an appeal by Field-Marshal Hindenburg in Sept. for a new economic and military armament of Germany, a "Hindenburg dole" was created in Oct. which was primarily intended for the benefit of soldiers disabled in the war. Maximum prices were fixed for a fresh series of commodities. In the spring of 1917 the consumption of bread had to be reduced to 170 grammes per head per diem, and even this quantity could not in some instances be supplied. All these circumstances materially contributed to create a feeling of longing for the end of the war; and this feeling, at the same time, was directed against the Government, which was considered responsible for such conditions. Strikes also began even among the munition workers. In order to make possible the continued production of munitions, great increases of wages had to be conceded.

At the very beginning of 1918, the fight for peace began with fresh violence. The main question was whether Pres. Wilson's Fourteen Points could form the basis for a peace. On Jan. 25, the Chancellor Count von Hertling announced his attitude to the Fourteen Points in the Main Committee of the Reichstag. He declared himself satisfied with them on the whole, with this restriction, that the peace must satisfy the rightful claims of Austria-Hungary, and secure the inviolability of Turkey. The nation began gradually to split into two parties, of which one rejected any disadvantageous peace, while the other conducted vigorous propaganda for peace even with concessions on the part of Germany. The deputy Erzberger became more and more prominent as the champion of this latter view. He entered into relations with Vienna, where the need for peace was even more urgent. In his endeavours Erzberger worked hand in glove with the Social Democratic party. The conclusion of peace with Russia furnished fresh material for the agitation of the advocates of peace. It was objected that this peace was not of such a nature as to enable Germany to hope for any conciliatory response from her enemies in the West. On Oct. 8, Erzberger laid down, in the Main Committee of the Reichstag, principles for Germany's Eastern policy, which could only betoken a declaration of war against the Hertling Cabinet. The Centre party, far from siding with Erzberger, actually published a declaration to the effect that the Government enjoyed the full confidence of the party; but the difference between Erzberger and Count Hertling was not thereby removed; and Hertling declined to receive Erzberger any longer.

In the spring of 1918, great attention was also aroused by a document published the previous year by the former German ambassador in London, Count Lichnowsky, who asserted in it that the German Government was responsible for the outbreak of war, while Sir Edward Grey on his side had done everything to prevent it. Lichnowsky in this connexion referred to a meeting of the Crown Council at Potsdam on July 5 1914, which was alleged to have been held with the Kaiser presiding, and which, according to Lichnowsky, adopted at that early date the decisions regarding the commencement of the war. The Vice-Chancellor, von Payer, declared on March 10 1918, in the Main Committee of the Reichstag, that these assertions were not in accordance with the facts, and denied that the alleged meeting of the Crown Council referred to had ever taken place. The controversy about this Crown Council was continued after the war. It was asserted again and again that it had taken place, as for instance after the Revolution by the then Bavarian Minister-President Eisner. Persons who were supposed to have been present at the Council, such as the Secretary of State von Jagow, repeatedly asserted, however, that the story of a meeting of the Crown Council on July 5 1914 was a fable (*see* EUROPE, section *War Period*).

As regards internal policy the Hertling Cabinet was the author of a number of new laws complying with some of the Social Democratic demands. Thus on June 8 the Reichstag passed a law for broadening the basis of the Reichstag. By this law the larger municipal and rural constituencies having more than 300,000 electors had a larger number of deputies assigned to them, and these were to be elected on the principle of proportional representation and *scrutin de liste*. On June 6 the salaries of members of the Reichstag were raised from 3,000 marks to 5,000.

In May the president of the Reichstag, Kampf, a member of the Progressive People's party, died. Fehrenbach, a member of the Catholic Centre party, succeeded him. Dr. Scheidemann and Dr. Paasche—Progressist Social Democrat and National Liberal respectively—became vice-presidents. Although the relations between the Chancellor Hertling and the Reichstag remained tolerable, dissatisfaction with several of the members of the Cabinet began to arise in the Reichstag. This applied especially to Kühlmann, the Secretary of State for Foreign Affairs, who was accused by the Left of having made a policy of annexation the guiding principle in concluding peace with Russia. Further, the *Deutsche Tageszeitung*, an organ of the Extreme Right, raised charges regarding Kühlmann's personal conduct during his stay at Bucharest. On June 21 Kühlmann made a very remarkable speech in the Reichstag, in which he stated among other things that an end of the war could no longer be reached by purely military decisions. The Chancellor, Count Hertling, considered it necessary in the next sitting to contradict this assertion by pointing out that there could actually be no question of any diminution of German confidence in victory. Herr von Kühlmann thereupon resigned, July 9. Adml. von Hintze, hitherto German minister at Christiania, was appointed his successor.

Meanwhile the Social Democrats clamoured for further progress in the direction of parliamentary Government. In Sept. they presented a series of minimum demands as the price of their continued support of the Government (demands which were very far-reaching) in internal affairs, and at the same time asked for the restitution of Belgium, liberation of all territories still under occupation, and the abandonment of the treaties of Brest-Litovsk and Bucharest. On Sept. 21 it was reported that Bulgaria had asked for an armistice. The Social Democrats now adopted a still firmer tone against the Government, demanding a true parliamentarism as the condition of their further collaboration.

Count Hertling did not see his way to complying. But the Catholic Centre and the Democrats adopted a similar basis for their demands in the Main Committee of the Reichstag, and on Sept. 30 Count Hertling asked to be relieved of his office.

The parties had already selected his successor, this being the first time a purely parliamentary choice had been made. They chose Prince Max of Baden, heir-apparent to the grand ducal throne of that state, who was considered to be a man of thoroughly democratic principle. His programme was the introduction of a radical parliamentary system, the restriction of the Kaiser's powers, and the acceptance of President Wilson's Fourteen Points. As Prince Max subsequently stated in the *Preussische Jahrbücher*, he did not intend to ask for an armistice, but merely wished to make an appeal to President Wilson in order to explain to him that he accepted his war aims and that Germany was ready to make heavy sacrifices in order to get peace. But Prince Max did not get the chance of putting his aims into practice. He succeeded indeed in making a few alterations, chiefly in regard to the appointment of Secretaries of State taken from the ranks of Parliament and invested with far-reaching powers. The opportunity for any further activities was denied to Prince Max of Baden's Cabinet. At the beginning of Oct. General Headquarters had already demanded that an immediate application should be made for an armistice. Meanwhile naval mutinies began in Kiel and Wilhelmshaven. In Munich the Republic was proclaimed, and the Social Democrats threatened the Imperial Government with action of a very thoroughgoing character. Accordingly Prince Max retired on Nov. 9 1918, having first appointed the Social Democrat Ebert to be his successor, and now the period of revolution began for Germany.

(C. K.*)

*The Revolution.*—The official birthday of the German Revolution is Nov. 9 1918. Its real beginning lay much further back. The war-years, with the burdens and the hardships which they imposed upon the people, had aroused feelings and had created conditions which in the political as in other spheres were big with the elements of a volcanic outbreak. A wise and skilful government might perhaps have been able to control the whole movement and to divert it into calmer channels, either by meeting the demands of the masses and effecting reforms of the constitution in time, or by fighting the movement with ruthless determination by every means at its command. The Government had neither the resolution nor the strength to adopt either of these courses. It vacillated between concession and resistance, and it drifted with the stream of circumstance into a situation where events simply crushed it out of existence. The last Imperial Chancellor of the old *régime*, Prince Max of Baden, had attempted at the last moment to stem the course of events by concessions. But he only did so when it was too late, and did it in a way which exhibited the characteristics of weakness too patently to have any real influence upon the course of events. It has already been mentioned that Prince Max desired to carry out a programme which would have placed the constitution of the Empire upon a new and far more liberal basis, and which in its broad lines would have embodied the principle of an Imperial Democracy (*Volkskaisertum*). The authoritative posts in his Cabinet were entrusted by Prince Max to Secretaries of State taken from the ranks of Parliament. The appointments were Gröber and Erzberger of the Catholic Centre party, Haussmann of the Progressive party (corresponding to the post-Revolution *bourgeois* Democrats) and Scheidemann of the Social Democracy. The Imperial Home Office was also given to a member of Parliament, the Catholic Centre deputy Trimborn, while the Department of Public Economics (*Wirtschaftsamt*) was given to the Social Democrat Bauer, with the Catholic Centre deputy and prominent trade unionist Giesberts as under-secretary. At the head of the Foreign Office was placed the former Colonial Secretary, Dr. Solf, with the Social Democrat David as under-secretary. The Prussian War Minister, von Stein, was replaced by General Scheuch, who was reputed to have Liberal views. In the speech which Prince Max delivered in the Reichstag on Oct. 5 1918, he set forth a government programme containing a decisive profession of democracy, and other points asserting as an article of faith the right of nationalities to determine their own political destinies. He likewise declared himself in favour of the evacuation of Belgium, and even offered compensation. This declaration of policy was immediately followed, on Oct. 28 1918, by a number of measures intended to make the constitution democratic and curtailing the prerogative of the Emperor. The Secretaries of State, who were members of Parliament, were accorded far-reaching powers. The military authorities were in future to issue instructions only with the assent of the civil administration. For the Imperial Chancellor in the exercise of his office the confidence of the Reichstag was to be requisite. Appointments, transfers, promotions and dismissals of officers could take place only with the counter-signature of the Imperial Chancellor or of the War Minister, whereas they had hitherto been effected by Imperial Cabinet order.[1] The Emperor issued an edict, published on Nov. 2, referring to this democratization of the constitution, and containing the sentence "the office of Kaiser is service for the people." But, as has been pointed out, all these measures were useless, because, before effect could be given to them, they were anticipated by the Revolution and all that it entailed.

The Revolution started in Kiel. A rumour had spread among the sailors that the fleet was at last going to be staked in battle. The result was that the crews hoisted the red flag on the ships and arrested the officers, or even, when they resisted, murdered them. The mutiny spread from Kiel to Travemünde, Hamburg and Wilhelmshaven. On Nov. 8 the Republic was likewise proclaimed at Munich. The Imperial Chancellor, Prince Max, did not know what to do when confronted by these events; his attitude was one of helplessness. The Social Democrats urged him to compel the Emperor to abdicate. Prince Max considered that he must yield to this demand, so he sent plenipotentiaries to Grand Headquarters at Spa, who pressed the Emperor to renounce the throne. The Emperor at first refused; and it has never been definitely ascertained how far there was a misunderstanding about this. What is certain is that, at the moment when Prince Max announced on the morning of Nov. 9 that the Emperor had resolved to renounce the throne and that there had been a corresponding renunciation on the part of the German Crown Prince, no renunciation either by the Emperor or by the Crown Prince was actually in his possession. He may have hoped by proclaiming such a renunciation to be able at least to save the throne for the House of Hohenzollern. But in that case he entirely failed to realize how far matters had already gone. On Nov. 9 the Revolution had already commenced in Berlin. For Prince Max no other course was now open but to retire at once together with his Cabinet. He vanished from Berlin and betook himself to his home in Baden.

Meanwhile the final events were taking place on the western front—the German request for an armistice, the negotiations with Foch, and the agreements which were concluded with him. The Emperor William left the front on Nov. 10 on the advice of those about him, because they believed that they could no more guarantee his personal safety. He betook himself to Holland, where, to begin with, he claimed the hospitality of Count Bentinck at Amerongen Castle. He was followed by the German Crown Prince, who was interned on the island of Wieringen in the Zuyder Zee. On Nov. 28 the Empress left Germany and joined her husband in Holland. The actual abdication of the Emperor did not take place till Nov. 28, the day of the Empress's arrival at Amerongen Castle. The Emperor signed on that day the abdication document which was laid before him by a deputation sent to Amerongen by the new Revolutionary Government. The Crown Prince renounced the succession on Dec. 5.

In the Republican Reich (formerly the German Empire) mat-

[1] The Emperor had three "Cabinets" or offices of his household—a civil, a military and a naval Cabinet, through which and occasionally on whose advice he had directly exercised his military and civil prerogatives. (Ed. *E.B.*)

ters were now *en train*. In all the states of the Confederation the sovereigns had been compelled to abdicate; nowhere had there been any fighting or bloodshed in connexion with these particular events. In Berlin the Revolution wore a theatrical rather than a dramatic aspect. The *bourgeoisie* there as elsewhere had been systematically kept by the Imperial Government in ignorance of ominous symptoms and incidents. The press had not been allowed to make the slightest disclosure of these things. Thus the citizens of Berlin—and the same holds true of the whole Reich—were absolutely taken by surprise when on the afternoon of Nov. 9 motor-lorries suddenly appeared in the streets all over the city, full of armed workmen, mostly youths, carrying red flags. They delivered speeches from the lorries and asserted that the Government had fallen. The only other thing that they did was to tear the black-white-and-red cockades from the caps of officers and soldiers whom they met in the streets, and to cut the epaulettes from the officers' coats. The outward beginning of the Revolution in Berlin was a procession of workmen which made its way into the city from the working-class quarter in the north and started by attempting to storm the barracks situated at the north end of the Friedrichstrasse. The guard fired upon them. Then the command arrived not to fire upon masses of workmen. This command was issued to all the military posts. From whom it came was never definitely ascertained. In these circumstances the only thing that the military could do was to surrender to the insurgents without a blow. In a number of instances sections of the troops joined the insurgents. There was therefore no bloodshed on the day of the Revolution or on the succeeding days. In fact one or two battalions would have sufficed to nip the whole business in the bud. Here and there shooting occurred—at the Castle, for example, where a search was being made for officers reported to be armed, and in the neighbourhood of the Castle; but these incidents rather provided amusement for the revolutionary bands, largely composed of youths.

The Revolution had been systematically prepared by members of the Independent Socialist party. The deputy Ledebour afterwards publicly boasted that he had been working at these preparations since 1916. Barth and Däumig made similar statements. The Independent Socialist Cohn is understood—indeed he subsequently admitted it—to have received large sums of money from Russia for the purposes of the Revolution; they were said to have amounted to about 12½ million marks. Bands of picked men (*Stosstruppen*), lavishly provided with rifles and machine-guns, had everywhere been formed. The "majority" (or governmental) Social Democratic party did not officially participate in these schemes. But when the Revolution began on Nov. 9, they associated themselves with the revolutionaries, and it was perhaps due to them that the Revolution did not take the course which it took in Russia, and that by persistent efforts order was gradually restored. The *bourgeoisie* was absolutely helpless in the days of the Revolution. It took things as they came and did not lift a finger to prevent them. Many sections of this class even thought that the time had come to go over with flying colours into the revolutionary camp of the Social Democracy, in order to participate in the advantages which the Revolution promised to secure for those who professed extreme opinions.

The Social Democrat Scheidemann, who had been in the Cabinet of Prince Max of Baden as a Parliamentary Secretary of State, had announced his resignation on Nov. 8. Prince Max, when he withdrew on Nov. 9, installed the Socialist leader Ebert as Imperial Chancellor. Ebert issued on the same day an appeal "to German citizens," inviting them to coöperate in the new order of things, even if they felt difficulty in doing so; on no account must there be any breakdown in that hour of trial. The Social Democrats then opened negotiations with the Independent Socialists, and a Council of Commissioners of the People (*Volksbeauftragten*) was set up as the supreme revolutionary authority, the two parties each being represented on it by three of their leading men. Ebert, Scheidemann and Landsberg were the three Social Democratic commissioners; Haase, Dittmann and Barth were the three Independents. The bureaucracy, with few exceptions, declared its readiness to continue its work provisionally under the new revolutionary *régime*. All the officials of the ministries, for example, remained at their posts, and tried their best, amid the confusion which at first reigned, to go on with their work upon the old lines.

The Council of Commissioners of the People had first of all to form a new Cabinet. It is noteworthy that this Cabinet consisted almost entirely of non-Socialists (*Bürgerliche*). The Prussian War Minister, Scheuch, and the Secretary of State for the Navy, von Mann, remained at their posts, and so did Dr. Solf at the Foreign Office, and Erzberger as a Parliamentary Secretary of State. The National Liberal deputy, Schiffer, became Finance Secretary, and the Progressist (non-Socialist Democrat) Professor Preuss was made Secretary of State for the Interior. It was only at the Food Department of the Reich that a Social Democrat, the deputy Wurm, was appointed. The first legislative order, which was issued in the form of an "ordinance having the force of law," swept away a number of pre-revolution enactments. Thus it raised the state of siege, abolished the restrictions upon the right of association and public meeting, decreed freedom of the press, proclaimed an amnesty for political offenders, repealed the wartime law which made patriotic auxiliary service obligatory, abrogated the regulations applying to domestic service and the special provisions regarding the obligation of agricultural labourers to work, while it enacted that private property should be protected. Further, it was at this early stage announced that elections would be held for a Constituent National Assembly, and that all men and women who had attained the age of 20 should be entitled to vote. At first, it is true, the new revolutionary Government was unable to evolve order out of the turbulent situation which had arisen with the Revolution. In all the towns and the larger villages Workmen's and Soldiers' Councils were formed and took over the administration, doing as they pleased with the money that was at their disposal, and in many instances issuing absolutely ridiculous and absurd orders. A central authority that could in any way intervene did not exist, so that each Workmen's and Soldiers' Council did as it pleased. Gradually the Berlin Workmen's and Soldiers' Council attempted to introduce a certain degree of order into the situation by assuming the part of the authoritative and supreme body placed over all the Workmen's and Soldiers' Councils of Germany, although it by no means succeeded in getting itself recognized by all the rest of the Councils. There was even a movement in the Berlin Workmen's and Soldiers' Council to get the powers of the Government permanently into its hands and to prevent the elections for a National Assembly. In the other parts of Germany, especially in the south, the most violent opposition arose against this arbitrary action of the Berlin Workmen's and Soldiers' Council. The Social Democratic party likewise published a declaration of its fundamental conviction that a reign of terror by an arbitrary Parliament of Councils was not in accordance with democratic principles such as it considered to be authoritative for the construction of the new Republic. The Soldiers' Councils now dissociated themselves from the Workmen's Councils and turned against them, accusing them of gross mismanagement of the finances and of squandering war material and food. Meanwhile the Berlin Workmen's Council had elected an Executive Board as its supreme authority, and this new body was claiming for itself the management of the whole business of the Reich and representing itself as the body which was entitled to exercise supreme authority and surveillance over the Government.

The constant attacks which were being made by the various Workmen's and Soldiers' Councils upon officers caused the War Minister, Scheuch, to resign office on Dec. 15. Colonel Reinhardt was appointed his successor. The Government now convoked for Dec. 16 a congress of delegates of all the Workmen's and Soldiers' Councils of Germany to meet in Berlin. At this congress there were wild scenes of conflict between the Extremists and the Moderates. The latter, however, were throughout in the majority, so that the Congress conferred executive and

legislative powers upon the six Commissioners of the People, fixing the date of the elections for the National Assembly for Jan. 19 1919. The Berlin Executive Board was thus put out of action. It continued, indeed, to make attempts to get into power again, but without success.

Meanwhile the Extremist group on the left wing of the Independent Socialists had seceded and had formed a party of their own called the Spartacus League, the more prominent leaders of which were Dr. Liebknecht, Rosa Luxemburg, and Däumig. This Spartacus League rejected the principle of democracy, and advocated a "dictatorship of the proletariat" in the form of a Soviet Republic on the Russian model. The Russian Bolshevik, Radek, was present at the meeting at which the League was founded, and was welcomed as the representative of Bolshevik Russia. The League at once organized a violent campaign conducted by every conceivable method against the Council of Commissioners of the People, preaching a second revolution against them. Already on Dec. 5 there had been collisions between a mass demonstration of the Spartacists and some military detachments. On Dec. 24 a regular battle began for the possession of the imperial castle, occupied by the Spartacists, and for the neighbouring imperial stables, which they also held. The Government sent troops against the insurgents, who chiefly consisted of former members of the Sailors' Division, formed during the first days of the Revolution in Berlin. The castle and the stables were stormed by the troops after a sanguinary struggle; there were heavy losses on both sides. The sailors were finally compelled to lay down their arms on a promise of immunity from punishment.

The Independent Socialist members of the Council of Commissioners of the People, Barth, Dittmann and Haase, had during the fighting adopted a very ambiguous attitude. After the capitulation of the insurgents they resigned office on the ground that the revolutionary Government ought not to have employed troops against the rebels. Their places in the Council of Commissioners were taken by the Majority Socialists Noske and Wissel, the first-mentioned of whom had done very good service in putting a stop to the naval mutiny at Kiel at the beginning of the Revolution. On Dec. 20 Dr. Solf resigned his post as Secretary of State at the Foreign Office, and was replaced by the minister at Copenhagen, Count von Brockdorff-Rantzau.

In Prussia, too, the Revolution had resulted in upsetting the central organization of that state. On Nov. 12 a Prussian Ministry, composed of Social Democrats and Independent Socialists, was formed. It took the curious form of a kind of dyarchy running through the whole of the departments, one minister being presumably appointed to watch and check the other. The presidency was held conjointly by the Social Democrat Hirsch and the Independent Socialist Ströbel, with equal rights. The Upper House and the Chamber of Deputies were dissolved. The only minister of the old régime who remained in office was the Minister for Railways, Breitenbach, but he retired on Nov. 26 and was succeeded by the ministerial director of that department. The Minister of Justice, Spahn, was replaced by a couple of Socialist lawyers, Rosenfeld and the highly cultured and gifted Wolfgang Heine; the Majority Socialist Dr. Sudekum was made Minister of Finance. The maddest appointment was that which was made to the Ministry of Public Worship and Education, where, alongside of the moderate Majority Socialist Haenisch, the Independent Socialist Adolf Hoffmann was installed, a man known by the nickname "Ten Commandments Hoffmann," because he was fond of introducing in his speeches passages from the Bible, although he had left the Church and did not profess any religion. Hoffmann was not proficient either in speaking or in writing the German language; he could neither open his lips nor take up his pen without perpetrating solecisms and grammatical blunders, to say nothing of the fact that he had not the slightest idea of the administration of schools or churches. His action was in keeping with his qualifications and was absolutely reckless; he never even informed his Majority Socialist colleague Haenisch of the autocratic ordinances which he issued. He straightway abolished the contribution of the State to the expenditure of the Church, and decreed that instruction in history should henceforth only be given from Social Democratic text books. He likewise abolished all religious instruction. There was soon a storm of indignation against Hoffmann in all scholastic circles, so that his colleague Haenisch had to revoke all Hoffmann's decrees. Irritated at this, Hoffmann resigned, after having taken care to draw his salary from the funds of the Ministry for several months in advance. There was a still worse state of things in the former duchy of Brunswick, where the president of the state was a tailor named Merges, while the Minister of Public Worship was a washerwoman.

The year 1919 opened with sanguinary disturbances. The Spartacus League under the leadership of Dr. Liebknecht had made elaborate preparations for a fresh insurrection. In the first days of January, mass demonstrations of the Spartacus League began in Berlin with the participation of large numbers of the Independent Socialists. The Majority Socialists called upon their adherents to assemble for counter-demonstrations in the Wilhelmstrasse and the Wilhelmsplatz, the quarter in which the Government offices were situated. Collisions at once took place in this district, but there was no bloodshed. It was not till Jan. 5 that the real rising commenced. The adherents of the Spartacus League, who were amply provided with rifles and machine-guns, first occupied the so-called "newspaper quarter" of Berlin, in particular the offices of the great non-Socialist journals, and also the great building of the Majority Socialist organ *Vorwärts*. They then tried to force their way into the Wilhelmstrasse. The Government had at its disposal only a small and diminishing number of troops. If the Spartacists had pressed their attack home with greater energy, it would have been easy for them to occupy the Government offices and to expel the Government. They were, however, intimidated by the sight of a handful of soldiers, who had occupied the approaches to the Wilhelmstrasse with machine-guns, and although there were various shooting affrays they did not venture upon any real assault. The Cabinet now entrusted one of its members, Noske, who had taken over the Ministry of National Defence (*Reichswehrministerium*), with the task of procuring troops. Noske, with the assistance of Gen. von Lüttwitz, collected in the western suburbs of Berlin all the troops that were available in the neighbourhood of the capital. Some new formations were also organized; they were mostly recruited from officers of the former German army. With these troops Gen. von Lüttwitz marched into Berlin, and a bloody struggle began, which lasted several days and finally resulted in the defeat of the Spartacists. Some of the newspaper offices had to be besieged for days and even bombarded with artillery, before the Spartacists who were holding them would surrender. There was a great deal of isolated fighting, and frequently there was firing from the roofs of the houses. A warrant for the arrest of Liebknecht and Rosa Luxemburg, who were at the head of the insurrection, was issued. Liebknecht was arrested on Jan. 16 in a Berlin suburb where he was in hiding, and was taken to the Eden hotel, where Gen. von Lüttwitz had established his headquarters. When the prisoner was being transported from the hotel to Moabit prison, he was shot by his military guards as he was making an attempt to escape.[1]

His associate, Rosa Luxemburg, had a similar fate. She, too, was arrested, and was conducted to the Eden hotel. When she was about to be transported thence to prison, she was felled by a soldier with the butt end of his rifle. Seriously injured and unconscious, she was placed in a motor-car, where another soldier shot her through the head. The motor-car rapidly conveyed her body to the neighbouring Landwehr Canal, into which it was flung. Several weeks elapsed before the body was found. Her funeral, like Liebknecht's, was attended by large crowds of their Spartacist followers. The murderer of Rosa Luxemburg was subsequently brought to trial, and was condemned and sentenced to a term of imprisonment. Altogether there were

[1] The Independent Socialists and the Communists afterwards persisted in maintaining, on the ground of some contradictory medical evidence, that Liebknecht was shot in cold blood.

several hundred lives lost in the Spartacist rising of Jan. 1919. In Stuttgart, as also in Bremen, Munich and other towns, there were sanguinary struggles, until the insurrection could be regarded as having been everywhere suppressed.

The elections for the National Assembly had taken place on Jan. 19. They resulted in a Socialist majority. The Majority Socialists won 163 seats, the Independents 22. As against these 185 Socialists there was a non-Socialist (*bürgerlich*) majority of 236, of whom 42 belonged to the German National People's party (the former Conservatives), 21 to the German People's party (formerly the National Liberals), 88 to the Christian People's party (formerly known as the Centre) and 75 to the Democratic party (formerly the Progressists); while 10 non-Socialist deputies did not adhere to any party. The total numbers of the votes recorded for the different parties were 11,509,048 for the Social Democrats, 2,317,290 for the Independent Socialists, 5,980,216 for the Christian People's party, 5,641,825 for the Democrats, 3,121,479 for the German National People's party, and 1,345,838 for the German People's party. It is noteworthy that the non-Socialist parties had all assumed new popular designations. In course of time, however, their old names came again into use, except in the case of the Democrats, whose new designation was more generally convenient.

The National Assembly was convoked to meet, not in Berlin, where constant disturbances were probable, but in Weimar in Thuringia, where it assembled on Feb. 6 1919. The Berlin Spartacists—the party afterwards known under the more comprehensive designation of Communists—made a fresh attempt at the beginning of March to abolish the National Assembly and to set up a Dictatorship of the Councils. It decreed a general strike for the whole of Germany, but the strike attained considerable dimensions only in Berlin. Once more it was the Marine Division which had recourse to acts of violence. It occupied the suburb of Lichtenberg, whence it attempted to force its way into the centre of Berlin. There were again sanguinary struggles in which more than 1,000 persons were killed. Among these were 29 members of the Sailors' Division, whom First Lieut. Marloh caused to be shot, after they had been arrested by the troops, when they had unsuspectingly come to fetch their pay. Proceedings were instituted against Marloh, but he was acquitted. The March rising of the Spartacists was completely quelled. Local risings in different places had the same fate,—at Halle, for example; at Stuttgart and at various other places in Württemberg; at Munich (where on April 7 a Soviet Republic was proclaimed); at Dresden (where on April 12 the Saxon War Minister Neuring, a Social Democrat, was thrown into the Elbe by the mob and perished); at Leipzig, at Hamburg, and so forth. In many of these local risings hundreds of people lost their lives.

The Constituent National Assembly sat at Weimar from Feb. 1919 onwards, meeting in the Weimar theatre, which was specially reconstructed. The Majority Socialist David was almost unanimously elected President. A matter of first concern was to get together a majority upon which a responsible Government could be based. Negotiations between the Majority Socialists and the Independents failed, because the two parties together were not sufficiently numerous to form a majority in the House, while the Independents refused to enter a coalition with any of the non-Socialist parties. The Catholic Centre and the Democrats, on the other hand, were prepared to renew the connexion which had united them with the Social Democrats in the old Reichstag since the date of the "Peace Resolution." Thus there arose a coalition of the Catholic Centre, the Democrats and the Social Democrats, who undertook to form a Cabinet. On Feb. 11 the National Assembly elected the Social Democrat Ebert to the presidency of the Reich by 277 votes against 102. Ebert entrusted the formation of a Cabinet to the Social Democrat Scheidemann, who assumed the office of Minister-President. The Democrat Schiffer was appointed Vice-President of the Ministry. The other members of the Cabinet were [illegible]ckdorff-Rantzau (Foreign Affairs), Preuss (Interior), [illegible]inance)—all these three belonged to the Democratic party—Giesberts (Post Office), Bell (Colonies)—both members of the Catholic Centre—Landsberg (Justice), Noske (National Defence), Bauer (Labour), Wissel (Ministry of Economics), Robert Schmidt (Ministry of Food), all these being Social Democrats. Erzberger, of the Catholic Centre, the Democrat Gothein and the Social Democrat David were members of the Cabinet but without portfolio. Fehrenbach replaced David as President of the National Assembly. The Right, *i.e.* the German National party and the German People's party (formerly Conservatives and National Liberals respectively), at once placed themselves in the most pronounced opposition to the new Cabinet, and on the extreme Left the Independent Socialists did the same. The whole session of the National Assembly at Weimar was characterized by controversies on these lines, which frequently assumed an extremely violent character. This was particularly the case during the debates on the new Constitution, for which Prof. Dr. Preuss had drafted a scheme. There were particularly stormy scenes when the questions of the socialization of industries and the new colours of the Reich were being discussed. A compromise on the second of these questions was proposed by the Catholic Centre and the Social Democrats, and it was finally agreed that the colours of the Reich should be black, red and gold, while the flag of the mercantile marine should be black, white and red, the colours of Imperial Germany, with black, red and gold in the upper canton next the staff. This was carried by 211 votes against 89.

The first grave ordeal which the new Coalition had to undergo was the ratification of the Treaty of Versailles. Up to the end of June the House, with the exception, perhaps, of the extreme Left, was unanimously of the opinion that a peace such as that which had been dictated by Germany's adversaries could not in any circumstances be accepted. The Minister-President Scheidemann declared in the House, amid tremendous applause: "Let the hand which signs this peace wither!" On June 22 the debates on the question of accepting or rejecting the Treaty of Versailles began. Scheidemann's Cabinet, which had committed itself to rejection, had resigned on June 21; it wished to leave the National Assembly perfectly free in its decision. The formation of the new Cabinet was effected under the greatest difficulties; it was finally undertaken by Bauer, who had hitherto been Minister of Labour. The Democratic party, the majority of whom were against signing the Treaty, declined to enter the new Cabinet. The Catholic Centre, too, was at first against accepting the Treaty, and it required great efforts and all the parliamentary diplomacy of Erzberger to bring about a change of opinion in the majority of his party. Finally the Bauer Ministry was formed for the purpose of signing the Treaty; the only parties represented in it were the Social Democrats and the Catholic Centre. Members of it who may be mentioned here were Müller (Foreign Affairs), Noske (National Defence), Erzberger (Finance) and Bell (Colonies)—the last-mentioned being, so to speak, a minister *in partibus*, as Germany no longer had any colonies. Each of the parties in the Assembly made only a short formal statement; the vote resulted in the acceptance of the Treaty of Peace by 237 against 138, while 5 deputies refrained from voting. The majority consisted of the Catholic Centre with the exception of its 13 Bavarian members, the Social Democrats and the Independent Socialists, together with 7 of the Democrats. The resolution adopted was in the following terms: "The National Assembly approves of the attitude of the Government in the question of the signature of the Treaty of Peace." The Government now sent word to Paris that it was prepared to sign the Peace, but that it rejected the passage in the preamble which dictated a confession of Germany's guilty responsibility for starting the war, and further, that it rejected the extradition of the army leaders and of those who were characterized by Germany's enemies as war criminals. The reply having come from Paris that the Peace must be signed unconditionally, the National Assembly gave the Government, on June 23, by the same majority as before, full power to sign even in these circumstances. The signature accordingly took place at Versailles on June 28 by the hands of the German Minister for Foreign Affairs, Hermann Müller, and the Minister

for the Colonies, Bell. On July 9 the National Assembly, by 208 votes to 115, gave its assent to the signature.

The most active member of the Bauer Ministry turned out to be the representative of the Catholic Centre, Erzberger, who gradually gave the whole Ministry its characteristic colour. He was always in the forefront when the Opposition had to be met. He replied to the attacks of the Right with still sharper counter-attacks. The question of responsibility for the war took a leading place in these encounters. Erzberger charged the Right and those who had been behind it with having destroyed all chance of concluding peace before it was too late. The Right, on the other hand, reproached Erzberger with having prematurely published the news of the Pope's attempt at mediation in Aug. 1917, with the result that the Vatican was compelled to abandon its efforts, so that the effect of Erzberger's action had really been to prevent peace. Erzberger's chief opponent in these controversies was the former Secretary of State for the Imperial Finances, Dr. Helfferich, who was now a deputy belonging to the German National (Conservative) party. A newspaper feud between Erzberger and Helfferich ensued, and led to an action for libel by Erzberger against Helfferich, the issue of which was delayed until March 1920. These controversies were again and again fought out on every possible occasion in Parliament, and filled columns of the press for many months.

The deliberations on the new Constitution were concluded on July 31 1919, and the final vote was taken upon the project as a whole. The Constitution was carried by 262 votes against 75, the minority consisting of the German National (Conservative) and the German People's (National Liberal) parties. On Aug. 11 the formal signature of the Constitution took place, and on Aug. 21 the Provisional President of the Reich, Ebert, solemnly took the oath of fidelity to the Constitution. According to the terms of the new Constitution (Art. 41) the President of the republican Reich must be elected by the whole of the Germans who possess the franchise; but, as the future extent of German territory had not yet been settled in accordance with the Treaty of Versailles, seeing that plebiscites had still to be taken in various regions, the first President, Ebert, was elected provisionally. The Minister-President Bauer now assumed the title of Chancellor of the Reich in accordance with Art. 52 of the Constitution. The National Assembly then adjourned till Sept., and decided to return to Berlin, where the situation had meanwhile become calmer, so that there was no longer believed to be any danger of interruption by demonstrations.

When Parliament resumed its session in Berlin at the end of Sept. negotiations were at once opened by the Government parties—the Catholic Centre and the Social Democrats—with the non-Socialist Democrats, with a view to the reëntry of the latter into the Coalition. The result was that the Democrats Schiffer and Koch became members of the Cabinet, Schiffer at the Ministry of Justice and Koch at the Ministry of the Interior. Shortly afterwards the Bavarian Democrat Gessler, chief burgomaster of Nürnberg, was appointed to a new office, that of Ministry of Reconstruction. On Oct. 11 the Ministry for the Colonies was abolished, as there were no longer any colonies to administer. The Right now started a campaign in favour of having a general election at an early date for the Reichstag, on the ground that the National Assembly had finished its task by passing the Constitution. This demand was extremely unwelcome to the Left, which did not expect to be successful in new elections and wanted to carry with the existing majority a number of laws in fulfilment of its own legislative programme. Perhaps the most important of these measures was the Factory (or Industrial Councils) bill, which contemplated the formation of councils in factories and other industrial and commercial establishments, giving the workers and salaried employees representative boards as well as a certain influence upon the management of the business in which they were engaged. Another important bill which was ultimately passed was the Socialization Law, laying down in general terms the principle that the whole mining industry should be transferred to the ownership of the State. The controversies on these matters were conducted by the interested parties throughout the country as well as in Parliament. The Factory Bill was not passed until 1920.

Particular difficulties were caused by the necessity of opening up new sources of revenue for the State. The public debt had increased to about 220 milliards of marks; the budget had reached the figure of 15 milliard marks of ordinary expenditure and 41 milliard marks of extraordinary expenditure. On June 28 the Minister of Finance, Erzberger, submitted to the National Assembly a number of minor taxation proposals, the most important of which was the War Contribution bill, which contemplated a levy rising to 50% upon the excess of incomes during the war over peace incomes. Similarly the greater part of capital increases during the war was to be appropriated by taxation, and the taxation of tobacco, sugar, matches, etc., was to be raised. On July 8 Erzberger developed a detailed financial programme in which he announced proposals for the so-called Emergency Contribution for the Reich (*Reichsnotopfer*), contemplating the sequestration of a considerable percentage of all personal fortunes. He advocated at the same time the transference of the administration of all state taxation from the territories (states) to the Reich. On Nov. 27 the National Assembly accepted this principle by passing a bill for regulating contributions by the states to the finances of the Reich. On Nov. 17 1919 the law enacting the Emergency Contribution to the Reich was carried by 238 votes against a minority of 43. On Nov. 7 the leader of the Independent Socialists, Haase, died from wounds which had been inflicted upon him by an insane assassin some days earlier as he was entering the Reichstag building. Other noted parliamentarians who died in the second half of 1919 were the leader of the Catholic Centre Gröber (Sept. 19) and Friedrich Naumann, leader of the Democratic party and author of the celebrated book *Mitteleuropa* (1915).

(C. K.*)

*After the Revolution.*—On Jan. 10 1920 the Treaty of Versailles came into force. On that day the representatives of Germany, von Simson and Lersner, signed the protocol of ratification at the French Ministry for Foreign Affairs in presence of representatives of the principal Allied Powers. America was not represented. From this date the time-limits for the fulfilment of the obligations contemplated by the Treaty and for the plebiscites began to run; and the whole course of German politics in 1920 was dominated by the anxieties over these problems. In a New Year's message the President of the Reich, Ebert, said: "Under the pressure of ruthless coercion a Peace Treaty had to be concluded which threatened to place the honour of our nation, its prosperity and the fruits of its past and future toil, at the mercy of foreigners." On the day of the ratification of the Peace, the Government of the Reich addressed a message of farewell to the "hundreds and thousands of members of the German nation" who were being separated under the Treaty from the Reich. In the occupied Rhineland, at Flensburg, at Malmédy, in the Saar region, in Upper Silesia, in the Memel district, at Bromberg, a foreign sway, which was in some cases to be temporary and in others permanent, came into force in accordance with the terms of the Treaty. In Jan. and Feb. the German prisoners-of-war in France were at last sent home. On Feb. 10 1920 the first of the plebiscites took place, and resulted in the transfer of a strip of territory in northern Schleswig, including Hadersleben, Apenrade and Tondern, to Denmark. The vote in the second Schleswig zone took place on March 14 and resulted in a German majority. A serious economic consequence of the conclusion of peace was that an even greater quantity of luxuries flooded Germany through the customs "gap in the west" (*Loch im Westen*) than had been the case in 1919. The consequence was that the exchange value of the mark continued to fall, so that it constantly became more difficult to import the food-stuffs, textile fabrics and raw materials that were urgently needed. Not until March or April was it possible to get the "gap in the west" partially closed by agreements with the Allied Powers.

The German National Assembly resumed its session on June 30 1920. On the orders of the day was the third reading of the

Factory Councils bill, the provisions of which did not go far enough to satisfy the extreme Left, the Independent Socialists. In consequence of the agitation conducted by that party, a crowd numbering close upon 100,000 persons assembled in the vast square in front of the Reichstag building and ultimately attempted to force their way into the National Assembly. The armed police were compelled to fire upon them, 40 persons being killed and over 100 wounded. The bill was finally passed on Jan. 18. The Taxation bill was then discussed—the income tax for the Reich, a special tax of 10% on incomes from invested capital (*Kapitalertragsteuer*) and the taxation of companies. Erzberger continued to be the leading spokesman of the Government in the advocacy of these proposals. He was at the same time occupying public attention in consequence of the action for libel which he had brought against the Conservative leader and former Secretary of State, Helfferich, who had accused Erzberger of combining with his political activity the advocacy of private commercial interests, and had also charged him with untruthfulness. The trial lasted seven weeks and resulted in the condemnation of Helfferich to a fine of 300 marks for libel or insult (*Beleidigung*), although the court animadverted upon Erzberger's conduct in terms which led his party, the Catholic Centre, to recommend his withdrawal for a time from public life. He had previously resigned the Ministry of Finance. During the trial an attempt had been made on Erzberger's life by a young officer named von Hirschfeld, who succeeded in wounding him.

Immediately after the conclusion of peace the Allied Powers demanded from Holland the extradition of the German Emperor. Holland persisted in declining to comply with this demand, but undertook to subject the ex-Kaiser to strict surveillance. Although the ex-Kaiser now enjoyed little popularity in Germany, the demand for his extradition was regarded as a national humiliation, and this feeling was intensified in the highest degree by the subsequent demand for the extradition of the so-called war criminals, seeing that the original French list contained the names of almost all the military leaders, including Hindenburg, Ludendorff and Tirpitz, and further the former Imperial Chancellor Bethmann Hollweg, several German sovereigns and heirs to German thrones, as well as 895 persons of different military ranks belonging to all classes of the German people. The list, moreover, was very imperfect and inaccurate in its designation of the persons whose extradition was demanded. Some of them were dead. The president of the German Peace Commission in Paris, Baron von Lersner, accordingly declined to receive the list which Millerand handed to him on Feb. 4 1920. The list was then presented in Berlin, and was followed by an exchange of notes and finally by a decision of the Supreme Council on Feb. 14 to the effect that certain alleged war criminals should be tried by the German Supreme Court at Leipzig. A list containing the names of 45 persons was presented to the German Government on May 7 1920. The trials were delayed by the fact that the Allied Powers took a long time to furnish the German public prosecutor with the names and the evidence of the witnesses for which he had asked. Some 15 cases were tried in the summer of 1921, some of them ending with a verdict of guilty and a sentence, others with an acquittal. In the army the excitement over the demand for the extradition of the military leaders was especially strong. Among the soldiers, as among the police, there was a determination to refuse to coöperate in any way in fulfilling this demand. Another cause of discontent was that the members of the small new army remained in complete uncertainty regarding their personal future. According to the Treaty, the German army, which in peace times had numbered about 700,000 men and during war had risen to 32,000[illegible] had now to be reduced to 100,000. This reduction had to take place within three months of the ratification of the Treaty. At Germany's request, however, the Supreme Council agreed on Feb. 18 1920 to extend the period for reduction to July 10. Until April 10 a strength of 200,000 men was to be permitted. At Spa, in July 1920, it was decided that the new army (*Wehrmacht*) should have a strength of 150,000 until the following Oct., but should be reduced to 100,000 by Jan. 1 1921. This decision was carried out by Germany.

The army reduction originally determined for April 10 was one of the direct causes of the military *Putsch* on March 13. There were two bodies of troops, the Ehrhardt Marine Brigade and the Löwenfeld Brigade, which refused to be disbanded. The political grounds for the insurrection, known as the "Kapp *Putsch*," may be explained as follows. In Jan. 1920 the text of the electoral bill for the first republican Reichstag and for the election of the President of the Reich had been published. It seemed that the date for the general election could not be long delayed. Yet the National Assembly rejected on March 9 a Conservative proposal for the dissolution of the National Assembly on May 1. On the Right the view was held that the mandate of the National Assembly had been fulfilled when it had constructed a new Constitution and concluded peace. It presently became known that the Social Democrats intended to propose that the President of the Reich should be elected by the Reichstag instead of, as the bill provided, by the whole nation. The feeling against the Government and Parliament created by this prospect was utilized by Kapp (*see* KAPP, WOLFGANG) of Königsberg and by Gen. von Lüttwitz, and on the morning of March 13 1920 they seized power in Berlin with the aid of the marine brigades quartered at Döberitz. The Government offices in the Wilhelmstrasse were occupied. Kapp assumed the Chancellorship and Lüttwitz the office of Minister of National Defence, and the constitutional Government was declared to be deposed. A new Government of "order, liberty and action" was described in a proclamation as having been instituted. The National Assembly and the Prussian Constituent Assembly were declared to have been dissolved. A Committee of the Social Democratic party replied by the proclamation of a general strike, an appeal to which the names of the President of the Reich and the Socialist ministers were attached. The Government and the President of the Reich fled to Dresden to prevent civil war and bloodshed. The Kapp movement was, however, confined to parts of north Germany and collapsed in a few days. Kapp and Lüttwitz threw up the game on March 17 and fled. Warrants for their arrest and for that of their leading accomplices on the charge of high treason were issued. Among these accomplices were Col. Bauer (a right-hand man of Ludendorff), Capt. Ehrhardt and the former Berlin prefect of police, von Jagow, who for a few days during the *Putsch* had played the part of Minister of the Interior. The National Assembly met on March 18 in Stuttgart, whither the Government had removed, and denounced the *Putsch* as a monstrous crime against the German nation. In the sequel disciplinary measures were taken, and a number of officers and officials were dismissed. The rank and file of the participators in the movement, however, were let alone. The prosecution of the chief conspirators was ultimately fixed to take place at the end of 1921.

The Kapp enterprise had been started with an incredible degree of political ignorance, and must be regarded as having amounted to an attempt at a monarchist revolution. It may be asserted, however, that none of the parties represented in the Parliament, including the *Deutschnationalen* (Conservative) party, participated in the movement. During the *Putsch* days there were sanguinary collisions in various towns between workmen and those bodies of troops which had declared for Kapp. Nine officers were murdered at Schöneberg, a suburb of Berlin, and a number of persons were shot on the departure of the so-called Baltic Corps at the Brandenburg Gate. In consequence of these events there was a new outbreak of the extreme revolutionary movement. In the Ruhr region in particular there were regular warlike operations by the Red Army, while at the same time the Communist free-lance, Max Hölz, overran the Saxon Vogtland and burned and plundered. A Bolshevist "terror" reigned for some days in the Ruhr region, where the extremists considered the moment to have arrived for setting up a Soviet republic, for which they had long been making preparations. There was a good deal of intimidation and raiding of banks and other commercial establishments, and

Government troops were being attacked and surrounded. The Government, however, hesitated for a time to intervene. In Berlin the general strike was with difficulty brought to a close. After negotiations with the trade unions, which demanded greater influence upon the formation of the Government and the conduct of affairs, a new Cabinet was formed under the presidency of the Social Democratic Minister for Foreign Affairs, Hermann Müller. The Minister of National Defence, Noske, whom the Independent Socialists and also a section of the Majority Socialists made responsible for the revival of the "militarist reaction," had previously resigned and was replaced by the Bavarian Democrat Gessler. Dr. Wirth of the Catholic Centre was appointed Minister of Finance. There were also ministerial changes in Prussia, the Social Democrat Braun becoming Minister-President, and Severing, also a Social Democrat, being appointed to the Ministry of the Interior—a post of the first importance in times of internal disturbance. Severing had come to terms with the Ruhr insurgents on March 25 at Bielefeld, and the Government had undertaken that if the conditions were fulfilled the regular troops (*Reichswehr*) would not be sent into the region. The truce was not maintained, and on April 3 troops marched into the Ruhr region from the north and the east. This action had an unfortunate effect upon the policy of France. The French seized the occasion to occupy Frankfort-on-Main and the Maingau. The Ruhr district formed part of a neutral zone, 50 km. broad, which was to have been denuded of all German troops in accordance with Art. 43 of the Treaty of Versailles. By a special agreement of Aug. 8 1919, however, Germany was permitted to keep a small garrison of regulars within the region. This garrison proved too weak to suppress the insurrection, and the Minister for Foreign Affairs, Hermann Müller, asked for permission to reënforce these troops. France refused. When German troops were nevertheless sent into the Ruhr region in consequence of desperate appeals from part of the population, and when Hermann Müller asked the Allied Powers to give their retrospective assent to these measures, the French Government gave orders to its troops to occupy the Maingau on April 6 as a guarantee. Germany appealed to the League of Nations without result. At a conference of the Supreme Council at San Remo (in April 1920) it was decided—as appeared from a subsequent declaration of Millerand in the French Chamber—that the evacuation of the Maingau should take place so soon as the numbers of the German troops in the Ruhr region were reduced to the figure permitted in the special agreement of 1919. The French evacuation accordingly took place on May 17, but not before six Germans had been killed and over 30 wounded in a collision with a detachment of black troops who were occupying the chief guardhouse at Frankfort.

The Social Democrat Dr. Adolf Köster, a journalist, succeeded Hermann Müller as Minister for Foreign Affairs on April 14. The National Assembly, after voting a bill for transferring to the Reich those railways which had hitherto been the property of the separate German states, and after having voted the sum of one milliard marks as compensation for damage caused during the civil disturbances, closed its session on May 21 1920. On June 6 the elections for the first German republican Reichstag were held and resulted in a distinct disavowal of the Coalition Ministry. The Democratic party suffered most seriously of all, while a great increase of seats was achieved by the Independent Socialists and by the two parties of the Right (the Conservatives and the National Liberals, to call them by their old names). The Democrats were reduced from 74 to 45, the Social Democrats from 163 to 112. On the other hand the *Deutsche Volkspartei* (National Liberals) were increased from 22 to 62, the *Deutschnationale Volkspartei* (Conservative Right) from 42 to 66, and the Independent Socialists (extreme Left) from 22 to 81. In view of these changes, the formation of a new Government presented the greatest difficulty. The President of the Reich had ultimately to entrust the task to the Catholic Centre deputy Fehrenbach, who succeeded in forming a Cabinet on June 26. This Cabinet no longer contained any Social Democrats, but, for the first time since the revolution, representatives of the *Deutsche Volkspartei* (National Liberals) were in the Government. Dr. Simons, who had been director of the legal department of the German Foreign Office but had resigned in 1919 with other members of the German delegation at Versailles, was appointed Minister for Foreign Affairs. He was soon the leading spirit in the new Cabinet, which to some extent fulfilled the demand of the *Deutsche Volkspartei* (National Liberals) for experts in ministerial posts. After the first republican German Reichstag had elected its presidential bureau from the different sections of the House, the Social Democrat Löbe being chosen president, the provisional President of the Reich, Ebert, addressed a communication to the Chancellor on June 25 asking the Reichstag to fix the date for the presidential election. The Cabinet, however, decided that the definitive election of the President of the Reich should not take place until after the plebiscite in Upper Silesia.

The formation of this Government took place under political pressure from abroad. The Supreme Council had determined at San Remo on April 18 1920 to discuss, in immediate conference with the German Government, certain outstanding questions arising out of the Treaty of Peace. At Hythe Mr. Lloyd George and M. Millerand had agreed that this conference was to be postponed until the new German Government had been formed. After a further conference at Boulogne on June 23 had produced three Notes complaining of the lack of goodwill on Germany's part to carry out the Treaty, German ministers sat for the first time at the same table with leading representatives of the Allies at Spa from July 5–16, in order to discuss with them questions connected with the execution of the Treaty. On the German side these negotiations were conducted by Dr. Simons and the Chancellor Fehrenbach, but there were moments when almost the whole Cabinet was at Spa. Under threat of the occupation of the Ruhr district the following points were arranged:—(1) the disarmament of the German army and its reduction to the strength of 150,000 men by Oct. 1 and to the strength of 100,000 men by Jan. 1920; (2) the reduction of the monthly deliveries of coal from 2,400,000 to 2,000,000 tons, with a reservation on behalf of the German share of Upper Silesian coal. In the negotiations on this point considerable impression was created by the appearance of the German coal and iron magnate Hugo Stinnes, accompanied by the miners' leader, Hue, both advocating the same view. The final arrangements for the payment of all the reparations due by Germany were adjourned, pending a further conference at Geneva.

While the Spa conference was still sitting a disagreeable incident took place in Berlin. On July 14, the day of the French national fête, a German workman hauled down the French flag on the embassy in Berlin. On Aug. 26 there was a further incident at Breslau, where a crowd of people who had been excited by the arrival of German fugitives from Upper Silesia forced their way into the Polish and French consulates. The satisfaction which was demanded was given by saluting the French flag and by an apology conveyed by the Minister for Foreign Affairs to the French ambassador.

On July 11 the second of the plebiscites was held on the borders of East and West Prussia and resulted in a distinct German success, some 95% of the inhabitants having voted for remaining German. Soon afterwards East Prussia was threatened by the backwash of the Russo-Polish war, and Germany asked to be permitted to send troops into the region which was still under the administration of the Plebiscite Commission. Both Poles and Bolsheviks were crossing the frontier into East Prussia at this time and were being disarmed and interned. In accordance with the German declaration of neutrality the transit of arms and munitions to Poland was being prevented, and this led in some cases to an excessive display of zeal by the German railway men, some of whom were in sympathy with Soviet Russia, so that regular Allied transports, e.g. the troops in Upper Silesia, were here and there held up.

The decision of the Ambassadors' Conference on the East Prussian plebiscite gave Poland only a narrow strip of territory on the right bank of the Vistula. Eupen and Malmédy went

by the plebiscite of July 24 to Belgium. In the summer of 1920 ambassadors from the Powers which had been at war with Germany were once more sent to Berlin, the business of their embassies having meanwhile been conducted by *chargés d'affaires*. On July 1 the French Ambassador Laurent, on July 2 the British Ambassador Lord d'Abernon, and on July 31 the Italian Ambassador Martino presented their credentials to the President of the Reich. Germany had, for her part, sent in Jan. 1920 the Catholic Centre deputy, Dr. Mayer, to Paris, the Hamburg senator, Dr. Sthamer, to London, and the former Minister for Foreign Affairs, Dr. Solf, to Tokyo. The newly instituted Papal nunciature to the Reich was taken over by the Papal Nuncio at Munich, Mgr. Pacelli.

The next business of the Reichstag was to give effect to the Spa decisions. On July 30 universal and compulsory military service, which had existed for more than 100 years, was abolished, and also military jurisdiction. On July 31 the law on the disarmament of the civil population was passed. It was carried out in the autumn by Secretary of State Peters, a process which included the surrender and destruction of over 2,000,000 rifles. In this connexion the much-canvassed "Orgesch" (*Organization Escherich*) instituted by the Bavarian Director of Woods and Forests, Escherich, for the protection of the citizens in the event of a renewal of Bolshevist disturbances—an organization characterized by certain extreme reactionary tendencies—was forbidden in Prussia. After the London Conference of May 1921 it had to be dissolved, together with the Bavarian *Einwohnerwehr* (voluntary military organization for citizens' defence).

The movement for the socialization of industry, which had reached its zenith during the period of the revolution, had in course of time become concentrated upon schemes for the socialization of the mining industry. A Socialization Commission had been appointed, and in Sept. 1920 it presented two alternative schemes. The one scheme was for the immediate and complete socialization of the mining industry, with compensation for the mine-owners. The other, of which Walther Rathenau, afterwards Minister for Reconstruction, was the author, contemplated a State monopoly of the wholesale coal trade, with still more ample compensation for the mine-owners. Meanwhile a new and novel kind of parliament had been established (June 30). This was the so-called provisional Economic Council of the Reich (*Reichswirtschaftsrat*), a non-political, purely economic parliament with 326 members. A joint committee of this Economic Council and the Coal Council of the Reich (*Reichskohlenrat*) discussed the two socialization schemes. Its verdict, of which Hugo Stinnes was doubtless the father, was in favour of a proposal that the coal-miners and workmen should participate in the capital and the profits of the industry by means of small shares. The miners, however, rejected this proposal, and in the course of a debate in the Reichstag the Minister for Economics, Dr. Scholz, declared that the question was not yet ripe and could be decided only on economic grounds.

About this time fundamental changes took place in the grouping of the Socialist parties. The Independent Socialists had applied at Moscow to be received into the fold of the Third International, whereupon the Third International had set up 21 conditions of admission, among them the exclusion from the party of all leading members who professed any kind of democracy or were infected with any kind of "social patriotism." At the Independent Socialist party congress held at Halle these conditions were accepted, after a speech by the Russian Bolshevik Zinoviev, on Oct. 16 1920, against a strong minority vote. The minority, the right wing of the Independents under the leadership of Crispien, thereupon separated from the New Communists, whose leaders were Däumig and Stöcker. The latter united in Berlin on Nov. 1 with the Communist party (led by Dr. Levi) and formed the "United Communist party of Germany, Section of the Third International." In the preceding spring a still more extreme group, the Communist Workers' party, had seceded from Dr. Levi's organization.[1] This group eschewed all participation in elections or parliamentary work. The Majority Socialists (*i.e.* the governmental or moderate Socialist party) renewed in Aug. 1920 at Geneva their adhesion to the Second (the Amsterdam-London) International, and, in the presence of their foreign associates, made confession of their own and Germany's responsibility for the German war policy.

The United Communist party instigated in March 1921 in central Germany, in the region between Halle and Eisleben, an insurrection, the chief object of which doubtless was to demonstrate their revolutionary character to their masters at Moscow. The Chief President of the Prussian province of Saxony, Hörsing, had had recourse to the services of the armed police (*Schutzpolizei*) in consequence of the intolerable situation in several great factories, where thefts, intimidation and strikes were the order of the day. The *Rote Fahne*, the organ of the K.P.D. (the Communist party of Germany), thereupon called a general strike and exhorted the whole of the workmen to take up arms. Many of the workmen of central Germany accordingly rose. What might be called the military conduct of the insurrection was assumed by the locksmith Max Hölz, who extorted money from "the bourgeoisie" for his Red Army and set their houses on fire. Attempts were made to wreck railway bridges and stations, post-offices and banks. In the great Leuna nitrogen works near Merseburg, the centre of the movement, all authority was for some weeks, on the Russian model, in the hands of the workmen. The Prussian Government, which at that time was predominantly Socialist, considered it politically expedient not to employ the regular army (*Reichswehr*) against the insurgent workmen, but to use only the armed police (*Schutzpolizei*). This police liberated the central region of Germany after hard fighting. The violent agitation conducted by the central committee of the K.P.D. in Berlin had meanwhile succeeded in causing the insurrection to spread to other towns, particularly Hamburg. The movement altogether cost the lives of several thousands of workmen and armed police. Dr. Levi and Klara Zetkin had shortly before this *Putsch* been compelled to retire from the leadership of the central committee of the Communists, in order to make room for people who would blindly obey the orders of Noske. The failure of the insurrection led to further disciplinary measures and splits within the Communist party in the Reichstag and also at the Communist party congress. Hölz was tried and condemned to penal servitude for life. The insurrection had nevertheless proved that by far the greater part of the Socialist working classes were no longer inclined to be driven into hopeless enterprises by irresponsible agitators.

In Prussia the elections for the Diet took place in Feb. 1921. Their result, like that of the elections for the Reichstag six months earlier, was that the old coalition was weakened and that the Social Democrats left the Government. A new Government was formed, after difficult negotiations, by the leader of the Christian trade unions, Stegerwald, a member of the Catholic Centre party; it was composed of Catholic Centre men and Democrats. The Fehrenbach-Simons Government fell in May over the Reparations question. The Allies, after a number of preliminary meetings, had settled at their Paris Conference in Jan. 1921 that the total amount to be paid by Germany should be 226 milliards of gold marks and an *ad valorem* tax of 12% on German exports. The German Minister for Foreign Affairs, Dr. Simons, stated on Feb. 1 in the Reichstag that these proposals did not give the German Government any possible basis for an arrangement. At the Reparations Conference in London (March 1–7) he submitted a German counter-proposal which was summarily rejected by the Allies. A memorandum, which was submitted by German experts, pointed out that the result of accepting the Paris decisions would be to compel the German workman to work 14 hours a day, and German industry and commerce to dump German goods on the markets of the world. The negotiations were finally broken off, and Dr. Simons left with the German delegation. The Allied Powers now imposed their so-called "sanctions." Düsseldorf, Duisburg and Ruhrort

[1] In German books and newspapers the first of these groups was frequently designated by the letters K. P. D. (*Kommunistische Partei Deutschlands*), the second by the letters K. A. P. D. (*Kommunistische Arbeiter-Partei Deutschlands*).

were occupied, a customs frontier was set up on the Rhine, and German exports were penalized by a 50% duty. On April 24 1921 Germany, after the President of the United States of America had declined to act as arbitrator, addressed a fresh request to America asking her to mediate in the Reparations question. At the third and last conference in London (May 1–5) the Allies addressed to Germany, in the form of an ultimatum which had to be accepted by May 12, the following demands:—The whole indebtedness of Germany for Reparations was to be 132 milliards of gold marks (£6,600,000,000), of which 50 milliards were to be rapidly paid off; a fixed annual payment of not less than three milliards of gold marks was to be made, consisting of a direct fixed payment of two milliards and a varying impost of 25% or 26% on German exports. The Reichstag accepted the ultimatum on May 10 after debates characterized by exceptional violence. A new Government, composed of Social Democrats, members of the Catholic Centre and Democrats, with Dr. Wirth (hitherto Finance Minister) as Chancellor, was formed, and was prepared to hazard the attempt to fulfil these colossal demands. Dr. Bauer (a former republican Chancellor) took the office of Vice-Chancellor; the Social Democrat Dr. Gradnauer was the new Minister of the Interior; while Dr. Walther Rathenau, managing director of the Allgemeine Elektrizitätsgesellschaft, took the Ministry of Reconstruction. Dr. Rosen, an experienced diplomatist, hitherto German Minister at The Hague, became Minister for Foreign Affairs. The first milliard of gold marks for the year 1921 was punctually paid by Germany by Aug. 31. On Oct. 6 and 7 the Minister for Reconstruction, Rathenau, concluded at Wiesbaden a convention with the French Minister for Reconstruction, Loucheur, regarding German payments in kind for restoring the devastated regions of northern France. The value of the contemplated deliveries of material was not to exceed seven milliards of gold marks up to May 1 1926. Associations of German industrial contractors were to be formed to carry out the deliveries.

The effect of the gigantic Government purchases of foreign bills for the Reparations payments was a heavy fall in the mark, which assumed a disastrous character in Oct. 1921 in consequence of the recommendations of the Council of the League of Nations regarding the partition of Upper Silesia. Upper Silesia had voted in the plebiscite of March 20 by a two-thirds majority for remaining German. At innumerable public meetings and demonstrations the German people had urged that the region ought to remain in the Reich; the Reichstag had voted a bill at the close of 1920 giving it autonomy. Another Polish insurrection instigated by Korfanty in the spring of 1921 had caused great suffering and damage. In spite of the protests of the whole German nation and of the great majority of Upper Silesians, including a good number of Poles, the portions of the region which were the most important for German commerce and industry, and therefore for the payment of the Reparations, were assigned to Poland in Oct. 1921 by the Allied Council of Ambassadors in accordance with the decision of the Council of the League of Nations. The result was a political crisis in Berlin and the resignation of the Wirth Ministry. But Dr. Wirth was indispensable at this stage, and in a few days he resumed office.

The negotiations between the Government of the Reich and Bavaria regarding the disarmament and the disbandment of the Bavarian *Einwohnerwehr* entailed difficult discussions. Both demands were, however, finally fulfilled by Bavaria. The Bavarian Minister-President, von Kahr, resigned in Sept. 1921 because he found himself unable to agree to the demand of the Government of the Reich that the state of siege in Bavaria should be raised. In Oct. the ex-kings of Württemberg and Bavaria died within a very short time of each other. The assassination of Erzberger on Aug. 26 1921 had caused great indignation and excitement among the parties of the Left and the Catholic Centre, and led to measures being taken by the Government of the Reich against press organs of the Right. The Reichstag after the autumn recess was engaged through the party leaders in negotiations that lasted for weeks in an endeavour to broaden the basis of the Coalition by making it include all the parties from the *Deutsche Volkspartei* (the old National Liberals) on the Right to the Social Democrats on the Left, with a view to securing a more stable basis for the economic life of the country and also in the interest of the Reparations payments, as the National Liberals largely represent industrial capitalism.

While, during the first years of the Revolution, all attempts to introduce any degree of order into the confusion which reigned in Germany seemed almost hopeless, it was nevertheless found possible, in course of time, to bring about a more tolerable state of things in both political and economic life. Until well into the year 1920 insurrections and disturbances, sometimes of a very ominous character, were constantly recurring in different parts of Germany. The insurrectionary movement then began to subside, and unrest became confined to a strike movement, which was, no doubt, very extensive and successively affected all kinds of workers and salaried employees. This movement, however, although it partially undermined the economic life of the country, ceased to constitute a real danger for the State. Events like the rising in central Germany and the earlier sanguinary disturbance in Berlin, in which the then prefect of police, Eichhorn, an Independent Socialist, played a very dubious part, and other dangerous incidents of the kind, were scarcely to be apprehended at the end of 1921. One great reason was that Communism, which was transplanted from Russia at the time of the Revolution, became more and more weakened in Germany. While in the year immediately following the Revolution strike movements bore a thoroughly political character, this was no more the case after the middle of 1920. In 1921 the whole nation was again systematically at work; it was only the constant rise in prices of the necessaries of life that exercised a powerful pressure upon the poorer sections of the population and incited them to frequent demands for higher wages and consequently to strikes. It was found impossible to maintain State control of traffic in the necessities of life. In particular the State could not permanently burden its finances by a standing subvention for the purpose of reducing the retail cost of articles of food. The system of control was therefore gradually replaced by internal free trade. This, it is true, was attended by an increase in food prices, which were further sent up by constant deterioration of the mark exchange to Germany's disadvantage. Not only the working classes, but also, in an especial degree, the officials suffered, and the latter class was reduced to a condition which more and more tended to herd them socially into the ranks of the proletariat. The same applied to intellectual workers and salaried employees. The constant recurrence of strikes with the object of maintaining the standard of living constituted a danger for the economic future of the country, especially as every increase of wages automatically led to an increase in the price of commodities. In the financial situation in which Germany found herself at the end of 1921, and in view of the vast payments which she had to make in consequence of the Reparations imposed upon her, the end of these unsound conditions was not yet in view. The financial demands of the State, too, were constantly increasing taxation. Germany was willing to work, but it was considered that the possibility of economically fruitful work could be secured only if Germany's creditors did not make excessive demands upon her and if they gave her time and means for carrying out those obligations of labour and payment which she had undertaken. (O. B.)

**GHENT** (*see* 11.919*).—Pop. (1914) 169,473, or, including suburbs (1910), nearly 250,000. The city measures 26 km. in circumference, much space being taken up by nurseries and gardens, Ghent having become a most important horticultural centre, especially for the cultivation of azaleas, rhododendrons, begonias, orchids, etc., under glass. Linen-weaving has greatly developed as a main industry and schools of industry and mechanics have been established. In 1913 2,363 vessels of over one million tonnage entered the port, and transport by smaller river-craft represented an equal tonnage.

The original panels of the famous "Worship of the Lamb" by Hubert and Jan van Eyck, which had been dispersed since

**These figures indicate the volume and page number of the previous article.*

1816, were brought together again in 1920 in pursuance of the terms of the Treaty of Versailles. The cast-iron steeple of the Belfry was removed in 1912. In 1913 a Great International Exhibition was held.

From Oct. 9–11 1914 Ghent was the headquarters of the British 7th Div. of the IV. Army Corps. On Oct. 12 the Germans entered the city and held it until Armistice Day, the Belgian army in following up the German retreat having reached the outskirts on Oct. 24 1918. During the occupation the Germans published the *Vlaamsche Post*, an organ professing Flemish sympathies and advocating the partition of Belgium. Intrigues on the part of the Germans to transform the university of Ghent into a purely Flemish institution (an aim long desired by the Flemish Nationalists) were resisted by the professors, some of whom were deported in consequence. The western suburbs suffered some damage in the final war operations.

See V. Fris, *Histoire de Gand* (1913), and *Bibliographie de l'Histoire de Gand*, 2 vols. (1907–21).

**GIBB, SIR GEORGE STEGMANN** (1850– ), British railway administrator, was born at Aberdeen April 30 1850. He was educated at Aberdeen grammar school and university, and in 1872 entered a solicitor's office as an articled clerk. In 1877 he became assistant in the office of the solicitor to the Great Western Railway, and from 1880 to 1882 practised his profession in London. In 1882 he became solicitor to the North-Eastern Railway, and in 1897 acted as arbitrator for that company on the question of wages before Lord James of Hereford. From 1891 to 1906 he was general manager and from 1906–10 director of the North-Eastern Railway, and in 1906 became managing director of the Underground Electric Railways Co. and chairman of the Metropolitan District Railway. In 1904 he was knighted. He served on the War Office Reorganization Committee in 1901, and the London Traffic Commission in 1903, and from 1910–9 was chairman of the Road Board. In 1915 he was appointed a member of the Committee on Production, and became its chairman in 1918.

**GIBBONS, JAMES** (1834–1921), American Roman Catholic cardinal (*see* 11.936), celebrated his golden jubilee as a bishop Oct. 20 1918. In 1917 he published *A Retrospect of Fifty Years*. He died in Baltimore March 24 1921.

**GIBSON, MARGARET DUNLOP** (1843–1920), and LEWIS, AGNES SMITH (1843– ), British orientalists, were twin daughters of John Smith, solicitor, of Irvine, Ayrshire. They were born at Irvine Jan. 11 1843 and educated at private schools and by private tuition, principally in classics and oriental and modern languages. In 1883 Margaret married the Rev. James Young Gibson (d. 1886), the translator of Cervantes, and in 1887 Agnes married the Rev. Samuel Savage Lewis, fellow of Corpus Christi College, Cambridge (d. 1891). The two sisters made together several journeys to Syria and Palestine, visiting Sinai six times, and in 1892 they discovered and photographed the Syro-Antiochene, or Sinaitic palimpsest, the most ancient known MS. of the four Gospels in Syriac. Four years later they brought to England the first leaf of the Hebrew *Ecclesiasticus*. In 1897 they founded and endowed the Westminster Theological College at Cambridge. In 1915 both were made gold medallists of the Royal Asiatic Society; they also received honorary degrees from St. Andrew's, Dublin, Halle and Heidelberg universities. They published numerous works on Syriac, and especially Sinaitic, MSS., on Arabic Christian MSS. and other ancient literatures. Mrs. Lewis also, before her marriage, published travel books and stories. In 1892 she wrote a *Memoir* of her husband and late in life published a volume of poems (1917). Mrs. Gibson died at Cambridge Jan. 11 1920.

**GILBERT, CASS** (1859– ), American architect, was born at Zanesville, [illegible] 24 1859. He was educated in the schools of Zanesville and [illegible] St. Paul, Minn., to which his parents moved in [illegible] and at the Massachusetts Institute of Technology. In 1883 he began the practice of architecture in St. Paul but subsequently moved to New York. He is perhaps most widely known as the architect of the Woolworth building in New York, 57 storeys, 760 ft. high, and, excepting the Eiffel Tower in Paris, the tallest structure in the world. Other buildings designed by him include the Minnesota State Capitol, St. Paul; the Endicott building, the Dayton Ave. church, and St. Clement's Episcopal church, in St. Paul; the U.S. Custom House and the Union Club, New York; the Brazer building, and the Suffolk Savings Bank, Boston; Art building and Festival Hall (for the Louisiana Purchase Exposition), and the Central Public Library, St. Louis; Ives Memorial Library, New Haven, Conn.; Public Library, Detroit. He also drew the plans for the university of Minnesota and for the university of Texas. He was appointed by President Roosevelt a member of the Council of the Fine Arts; and by President Taft a member of the National Commission of Fine Arts, and was reappointed by President Wilson. He was a member of the National Jury of Fine Arts at the Chicago Exposition (1893) and a member of the National Jury for Architecture at the Paris Exposition (1900). He was made a member of the National Academy in 1908 and of the American Academy of Arts and Letters in 1914. He was elected president of the American Institute of Architects in 1908, of the Architectural League of New York in 1913, and of the National Institute of Arts and Letters in 1919.

**GILBERT, GROVE KARL** (1843–1918), American geologist (*see* 12.7), died at Jackson, Mich., May 1 1918. Among his latest writings were *The Transportation of Débris by Running Water* (1914) and *Hydraulic Mining in the Sierra Nevada* (1917).

**GILBERT, SIR WILLIAM SCHWENK** (1836–1911), English playwright and humorist (*see* 12.9), was drowned at Harrow Weald, Middlesex, May 29 1911 in an effort to save a lady in his own grounds. His play *The Hooligan* was produced on the variety stage a short time before his death.

**GILBEY, SIR WALTER,** 1ST BART. (1831–1914), English wine merchant (*see* 12.11), died at Elsenham Hall, Essex, Nov. 12 1914.

**GILL, SIR DAVID** (1843–1914), British astronomer, was born in Aberdeenshire June 12 1843 and educated at the university of Aberdeen. From 1868 to 1873 he was in charge of a private observatory at Aberdeen, and from 1873–6 of Lord Crawford's observatory at Dunecht, organizing from there the expeditions to Mauritius to observe the transit of Venus in 1874 and to Ascension I. to determine the solar parallax by observations of Mars in 1877. He became Astronomer Royal in Cape Colony in 1879 and retained that post till 1902. There he observed the transit of Venus of 1882 and photographed the great comet of that year. He did much to advance stellar photography and its use in cataloguing the stars, and he was responsible for the geodetic surveys of Natal and Cape Colony, British Bechuanaland, German S.-W. Africa and Rhodesia. He was the recipient of many medals and honorary degrees and was created K.C.B. in 1900. In 1907 he was president of the British Association. He died in London Jan. 24 1914.

See *David Gill, Man and Astronomer*, by George Forbes (1916).

**GILLETT, FREDERICK HUNTINGTON** (1851– ), American politician, was born at Westfield, Mass., Oct. 16 1851. He was educated at Amherst (A.B. 1874; A.M. 1877) and at the Harvard Law School (LL.B. 1877). In 1877 he began to practise law in Springfield, Mass. From 1879 to 1882 he was assistant attorney-general of Mass., and in 1890 was elected to the Mass. House of Representatives, serving two terms. In 1893 he was elected U.S. congressman and thereafter repeatedly reëlected to serve through 1923. He was a member of the Appropriations Committee and chairman of the Committee on Civil Service Reform. In 1914 he favoured the Panama Canal Tolls Repeal bill but opposed the administration's Mexican policy. In an address before the Pan-American Commercial Congress, 1919, certain of his remarks about Mexico brought protest to the State Department from the Mexican chargé d'affaires and led the Mexican Government to withdraw its delegates. In May 1919 he superseded Champ Clark (Democrat) as Speaker of the House, and in 1920 was a delegate-at-large to the Republican National Convention.

**GINER DE LOS RIOS, FRANCISCO** (1840– ), Spanish philosopher and lawyer, was born in Ronda (Andalusia) in 1840,

of a middle-class family, connected on his mother's side with an illustrious political family. He graduated in Granada, and very early in life came to the university of Madrid as a professor of jurisprudence. He there felt the influence of Prof. Sanz del Rio, Krause's famous disciple. Twice he resigned his chair, together with several of his colleagues, in a brave stand for liberty of thought in the university against a reactionary Government, and twice he was reinstated. He was one of the founders of the Institucion Libre de Enseñanza, an educational institution which did much to improve teaching methods in Spain and, when created, was well in advance of its time, not only for Spain but even for Europe in general. He many times refused election to the Cortes, and in 1873 declined a post in the Government. His greatest influence was personal and direct, for he was a born teacher, a man of refined sensibility, pure in his life as in his ideals.

He published several volumes of essays—literary, educational, philosophical and religious—as well as *Lecciones Sumarias de Psicologia* (1871); *La Idea del Derecho* (trans. from the German of Röder, 1885); *Resumen de Filosofia del Derecho* (1898) and other works. A complete edition of his works was undertaken in 1916.

**GINSBURG, CHRISTIAN DAVID** (1831–1914), British Hebrew scholar (*see* 12.29), died in London March 7 1914.

**GIOLITTI, GIOVANNI** (1842– ), Italian statesman (*see* 12.31). The elections of 1909 returned a strong Giolittian majority, but the Premier found himself faced with the necessity for renewing the steamship conventions which were about to lapse. The bill presented by his Cabinet on this subject was open to much criticism, having been designed to conciliate conflicting political interests rather than to solve the actual problem. The vigorous attacks of the Opposition, led by Baron Sonnino, induced Giolitti to adjourn the debate until the autumn, when, the Cabinet having been defeated on a point of procedure, he resigned (Dec. 2). But he continued to play an active and in fact dominant part in Parliamentary politics, for the majority of the Chamber and of the Senate being thoroughly Giolittian, the Sonnino Ministry and that of Sig. Luzzatti which succeeded it only remained in power at his discretion. When in March 1911 the latter resigned in consequence of the hostile vote of the Radicals and the resignation of its two Radical members, Giolitti was again called upon to form a Government (March 31). The chief event of his fourth Cabinet was the Libyan War. Personally he was not enthusiastic over the African enterprise, as it introduced new and, to him, unaccustomed and unwelcome values into Italian political life; but he realized that public opinion demanded it and he did not care to run counter to the current. He was criticised by the vestals of constitutional tradition for having declared war without consulting Parliament and for not having summoned it until several months later. His conduct of the Government during the campaign was also severely blamed, as he acted as though the war were merely an affair of internal politics and party combinations. When peace was concluded fresh elections were held on the new franchise law introduced by the Cabinet, which raised the electorate from 3,000,000 to 8,000,000 votes (Oct. 26–Nov. 2 1913); although a Giolittian majority was again returned, his opponents, not only among the Socialists but also among the constitutional parties, were now more numerous, and he felt that opposition to his rule was growing in the country at large even more than in Parliament. The various awkward problems which now faced the Government, and the divisions among its own supporters, induced him to seize the opportunity of a hostile vote by the Radical group to resign (March 10 1914). When the World War broke out his attitude was favourable to the absolute neutrality of Italy, believing that his country's interests lay in not siding with either group of belligerents, and on the eve of Italian intervention he made an attempt, by using his personal hold over the Parliamentary majority, to upset the Salandra Cabinet, but it was frustrated by an uprising of public opinion in favour of war. During the progress of the campaign he kept away from public affairs, although he assumed a Cassandra-like attitude in all his utterances, and his henchmen in the press were frankly "defeatist." He consequently lost his influence over public opinion, and in many quarters was regarded as little better than a traitor. But after the Armistice the unsatisfactory consequences of the peace negotiations, the heavy burden of suffering and loss caused by the war, and, above all, the intolerable internal policy of the Nitti Cabinet, which seemed prepared to hand the country over to the Bolshevist Socialists, brought about the return of Giolitti to the sphere of practical politics once more. When Nitti was forced by the impossibility of governing the country to resign for the third and last time on May 20 1920, the return of Giolitti was the inevitable alternative. He succeeded in forming a Cabinet which comprised a number of non-Giolittians of all parties, but only a few of his own "old guard," so that he won the support of a considerable part of the Chamber, although the Socialists and the Popolari (Catholics) rendered his hold somewhat precarious. His policy during the occupation of the factories by the workmen organized by Bolshevist leaders in Sept. 1920 provoked the indignation not only of the manufacturers but of all the middle-class. But he appears to have acted under the impression that the Socialists were much stronger than they really were, and therefore gave them a free hand with the object of avoiding bloodshed, and also perhaps with that of proving to the workmen that they could not run industry without the capitalists and the technical experts. When he realized the strength of the national reaction, he allowed the patriotic *fascisti* free rein to reestablish order and practically exercise many functions of Government, while he assumed an attitude of Olympic calm and posed as being *au dessus de la mêlée*, so as to avoid compromising himself with any party. In foreign affairs he succeeded in achieving as satisfactory a solution of the Adriatic problem as was possible under the circumstances. In view of the annexation of new provinces under the peace treaties and of the altered state of public opinion on internal policy, he dissolved the Chamber on April 7 1921, and was confirmed in power by the elections on May 15. But he resigned with his Cabinet at the end of June, being succeeded as Premier by Signor Bonomi.

**GLADDEN, WASHINGTON** (1836–1918), American Congregational divine (*see* 12.63), died at Columbus, O., July 2 1918. His latest publications included *The Labor Question* (1911); *Present-Day Theology* (1913) and *Live and Learn* (1913).

**GLASGOW** (*see* 12.80).—By the Glasgow Municipal Boundaries Act (1912), Glasgow again became in population the second city of the British Empire. The burghs of Govan, Partick and Pollokshaws, and several suburban districts, including Shettleston and Tollcross in Lanarkshire and Cathcart and Newlands in Renfrewshire, were brought within the municipal boundary, increasing the area of the city from 12,975 to 19,183 acres. The pop. of the annexed areas was 226,309 by the 1911 census, and the pop. of the unextended city in 1911 was 784,496. The estimated pop. in 1920 was 1,121,842.

The valuation of the burgh for 1911–2 was £5,977,249, for 1913–4 £7,473,325, and in 1920 £9,200,000. The number of municipal wards was increased in 1912 from 26 to 37, and the membership of the Corporation from 80 to 113—three representatives of each ward and two *ex-officio* members (the Dean of Guild and the Deacon Convener of the Trades). By the Representation of the People Act (1918) the city sends 15 members to the House of Commons, the Parliamentary divisions being Bridgeton, Camlachie, Cathcart, Central, Gorbals, Govan, Hillhead, Kelvingrove, Maryhill, Partick, Pollok, St. Rollox, Shettleston, Springburn and Tradeston. The Act increased the number of voters in Glasgow from 242,000 to 526,000. An extension of the municipal buildings was in progress before the World War, and the memorial stone was laid by the King on July 7 1914. The Mitchell library, the largest of the Glasgow public libraries, was removed in 1911 from Miller St. to a spacious building in North St., erected at a cost of £100,000, and opened on Sept. 28 1911 by Lord Rosebery. The Corporation, which, under a series of municipal acts has power to levy an assessment of 3d. per £ for library purposes, established 17 district libraries throughout the city. In 1915 the Corporation purchased for £50,000 the Balloch Castle estate, of which 200 ac. were converted into a public park known as the Loch Lomond Park. Other purchases were the Linn Park (1919) covering 180 ac., and the Ruchazie and Frankfield Park (1920) covering 300 ac. The Newlands Park was given in 1913, the

Glenconner Park in 1914, and the Dawsholm Park in 1920. In 1911, 121 ac. of the grounds of Pollok House were given to the Corporation for use as a public park for a period of ten years. Statues of Lord Kelvin (1913), Lord Roberts (1916) and Thomas Carlyle (1916) have been erected in the Kelvingrove Park.

The increase of population has led to some anxiety about the water supply. An additional supply from Loch Arklet came into use in 1914, but in the same year a bill to secure additional water from Loch Voil and Loch Doine was rejected by a committee of the House of Lords. A Glasgow Water Order was, however, obtained in 1915 giving power to impound the waters of the river Turk in Glenfinlas and to convey the water thus obtained by a tunnel to Loch Katrine. The commencement of the necessary work was delayed by the war, and immediate relief was obtained by a Provisional Order (1919) enabling the Corporation to raise the level of Loch Katrine. In 1919 the Corporation purchased 24,110 ac. in the watershed areas of Loch Katrine and Loch Arklet at a cost of £71,850. The average daily quantity of water sent into the city was in 1920 79,147,673 gallons.

Important developments of the municipal undertakings (gas, electric light and power, tramways and slaughter-houses) were delayed by the war. A Housing Committee of the Corporation reported that a total of 57,000 houses of 3, 4, or 5 rooms was urgently required, and it was hoped to build 7,000 by the summer of 1922; plans and schedules for nearly 4,500 had been prepared, and 300 timber houses had been completed by the end of 1920. The estimated cost of 4,443 permanent houses, including streets and sewers, was £4,763,686. A new justiciary building was opened by Lord Dunedin on July 7 1913.

During the period of voluntary recruiting for service in the World War the total enlistments in the city of Glasgow numbered 178,000 (inclusive of recruits from areas outside the boundaries).

The amount invested in the various forms of War Loan was approximately £83,500,000, and subscriptions for benevolent purposes connected with the war reached a total of £5,000,000.

**GLASS, CARTER** (1858– ), American politician, was born at Lynchburg, Va., Jan. 4 1858. He studied in the schools of his native town; learned the printer's trade, which he followed several years; and became proprietor of the *Daily News* and the *Daily Advance*, the morning and evening papers of Lynchburg. He was elected to the Virginia State Senate for two terms (1899–1903) and was a member of the State Constitutional Convention in 1901. He was elected to the national House of Representatives to fill the unexpired term (1902–3) of P. J. Otey, deceased, and was continuously re-elected thereafter to serve through 1919. As chairman of the House Banking Committee he was active in framing and passing the Federal Reserve Bank Law. In 1918 he resigned from the House to enter the Cabinet of President Wilson as Secretary of the Treasury, succeeding William G. McAdoo. Under his guidance the fifth Liberty Loan was floated in April 1919. In Nov. 1919 he was appointed by Governor Davis of Virginia to serve in the U.S. Senate for the unexpired term (1919–25) of Thomas S. Martin, deceased, and he resigned as Secretary of the Treasury. He was chairman of the Committee on Resolutions at the National Democratic Convention in 1920.

**GLASS** (*see* 12.86).—During 1910–20, and more especially during the period of the World War, very considerable developments in the glass industry occurred, both in the glass produced and in the varieties of glass manufactured. In the following article attention is, of necessity, given to the British glass industry. In certain respects the art of glass-making has for long been at a very high level in Great Britain. The products of leading manufacturers in the London, Stourbridge and Manchester districts, so far as table-ware, ornamental glassware and coloured glasses for windows are concerned, have, for many years, been of as fine a quality as any obtainable elsewhere. Indeed some of the ornamental glassware made in England has long been unrivalled. There is no need to amplify what has been said in the earlier article on these matters. When the war drew attention to the British position in respect of glass generally, it was in the direction of scientific glassware and special glass for certain industries, that the deficiencies were realized. Glass for scientific purposes may be taken to include optical glass and all glassware used in laboratories.

*Laboratory Glass.*—To deal with laboratory glassware in the first place. Before the war it may be said that nearly all the glass and glass apparatus used in laboratories throughout the United Kingdom was obtained from abroad. The main kinds of glass required for laboratory purposes may be grouped thus: Soft glass for tubing, and for a number of articles and vessels where the highest resistance to chemical action is not required, glass highly resistant to chemical action; very hard glass for combustion tubing; glass for thermometers.

*Soft Glass.*—Such a glass must be soft enough to be readily worked in a flame, and must stand prolonged heating without showing the changes in appearance and working qualities generally described as devitrification. Before chemical glassware of foreign origin became practically universal in laboratories, vessels and apparatus in great variety were made from lead glass. Many examples have survived long and continued usage. Their appearance at the present time shows how good this glass was in respect of its general resistance to chemical change, and their survival probably is to be ascribed largely to the property of such glass, when well made, of withstanding changes of temperature. Lead glass for chemical use has certain disadvantages. It may contaminate solutions with lead, and some varieties of it are specially prone to show surface darkening when exposed to solutions of alkaline sulphides. Again, in working lead glass in the flame, the care needed to avoid reduction of the lead with consequent blackening made the introduction of a workable glass free from lead a very welcome change to those who had not mastered the art of working lead glass. Experience has shown that the many advantages claimed for non-lead glass as a material for laboratory apparatus have been proved, and there is no likelihood of a return, nor adequate reason for a return, to lead glass. Common custom has, however, directed the attention of laboratory workers so markedly away from lead glass that it may be worth mentioning here that this glass can be made of such high resistance to the action of water, and of many solutions which also abstract alkali from glass, that in some special cases vessels made from it are only surpassed by silica in resistance to chemical change. As one instance, certain colloidal preparations can be kept far longer in vessels made from a suitable lead glass than is found to be possible with any of the chemical resistance glasses of the non-lead type. The durability of well-made lead glass is a matter of common experience in table glassware, many examples of which have been in constant or occasional use for years, exposed to variable atmospheres and all the processes incidental to cleaning, without showing any noticeable disintegration or discoloration of their surfaces. It is not intended here to advocate the use of lead glass for general scientific other than optical purposes, but only to suggest that it has certain properties which are useful, and which might advantageously be more fully considered than has been the custom in dealing with glasses for laboratory use.

In the early days of the war it was recognized that there would be a serious shortage of laboratory vessels. A simple sodium-calcium-silicate glass was known to be unsuitable since the readiness with which it devitrifies in a flame makes it impossible to produce from it any articles which have to be lamp-blown, and tubing made from it is practically useless to workers in laboratories. The immediate advance made was the addition of alumina, either as such, or preferably in the form of felspar. The use of alumina for retarding devitrification and for rendering a glass workable in the flame was known in Great Britain, and at least three British manufacturers had for some years produced glasses containing various percentages of alumina up to about 10%.

It is unnecessary to go in detail through the stages of development of the so-called soft soda glass, but one or two points may be mentioned. Quite early in the production of this kind of glass it was recognized that a sodium-potassium-calcium-aluminium-silicate type of glass had most satisfactory general properties, that arsenic was not permissible, and that the only constituent other than those indicated which might be added was a small amount of manganese dioxide, to disguise the green colour due to the presence of iron in the material used. The formula given here shows the approximate composition of a batch mixture expressed in percentages of silica and oxides of the metals in the various ingredients of the batch:—$SiO_2$, 68; $Al_2O_3$, 4; $CaO$, 7; $K_2O$, 6·5; $Na_2O$, 14·5. Manufacturers vary

the proportions somewhat, either to suit their furnaces or through preference for some particular set of proportions, but the formula given is an example of one yielding a good glass, soft enough for flame-working while possessing good durability.

Glass of this type was made in the early part of the war, and would have been continued, as one meeting many scientific and industrial requirements, had it not been for the necessity of conserving supplies of potassium compounds, of which the amounts that could be apportioned for use in glass manufacture were sufficient only for the production of certain optical glasses. Without potassium compounds these optical glasses could not be made having the constants required by the optical industry. Manufacturers of other scientific glassware had, therefore, to search for methods of producing soft workable glasses without employing quantitites of manufactured potassium compounds. To some extent nitre was available and was used. Potash felspar, which for long had been an ingredient in certain glasses, was a convenient form of aluminium compound for introducing alumina. The amounts of this material employed varied between wide limits, and glasses of good working qualities were obtained. Good examples of potash felspar contained about 10% of $K_2O$. If in the above formula all the alumina be introduced in the form of such felspar, about 2% of $K_2O$ is also introduced into the glass. Glasses having many good qualities were made with enough felspar to yield from 3 to 4% of $K_2O$ in the resulting glass, but the amount of alumina introduced rendered the glass too stiff, and liable also to give a roughened surface if long worked in the blowpipe flame. Such roughening could be removed by heating to a higher temperature, but its occurrence was a decided objection, and, moreover, flame-workers were placed at some disadvantage in respect of the time occupied in the production of blown vessels and apparatus. To remedy these defects varying proportions of borax were employed, and in this way sodium-potassium-calcium-aluminium-boro-silicate glasses of good working qualities and of marked durability were produced, which met many of the requirements of laboratory workers. Some investigators and manufacturers of scientific glassware, however, looked upon these glasses as temporary expedients, and only awaited supplies of potassium compounds to return to the earlier type.

It is not found convenient by glass-makers to have to produce a very great variety of glasses. Unless a glass is generally suitable for the needs of laboratories and of industries where ready and kindly working in a flame, along with good durability, is required of it, the glass fails to fulfil the requirements it may reasonably be expected to meet. For example, the boro-silicate glass referred to possessed many desirable properties, and articles made from it in the flame, and also by blowing into moulds, left little to be desired when the glass was well made and the necessary technical skill had been acquired. It failed, however, when used for X-ray tubes. Good and workable bulbs and tubing could be made from it, but experience showed that X-ray tubes of this glass took longer to exhaust, and that there was a lack of stability in the vacua obtained. Investigation left little doubt that the glass parted with water vapour under electrical bombardment, and the results of numerous experiments proved that borax was an undesirable ingredient in glass intended for X-ray work. A glass of the general type indicated in the formula above is quite suitable for such work, and hence X-ray bulbs and tubing can be made from it in the course of working a pot for a variety of other articles. It may be mentioned here that, unless manganese in small quantity be present in the glass, an X-ray tube in use does not exhibit the green phosphorescence with which workers with X-rays appear to have become accustomed. As manganese dioxide is generally added as a so-called decolorizer, only one type of glass need be made for practically all the scientific purposes and many of the industrial purposes to which a comparatively soft glass is put. Experience so far appears to show that the best type is on the lines of the formula given, and that the presence of notable proportions of the oxides of aluminium and potassium are essential. It is unnecessary to go into details about the form in which each ingredient of the glass is introduced in the batch mixture. Potash felspar has been mentioned as a convenient source of alumina, and part of the alkalies may be usefully added as nitrates. In general, all the materials of the batch mixture should be as pure as can be obtained commercially, so that the composition of the glass may depart as little as possible from that which it is intended to have, and which has been proved to give satisfactory results.

Before proceeding to other types of scientific glassware which were called for during the war, one or two remarks which are relevant for almost all glasses may be made here.

As far as it is possible to obtain and to store them, all the substances for a batch mixture should be free from water. In several instances it has been shown that a glass made from anhydrous materials differs from one calculated to give the same composition finally, but produced from a wet batch, or from one containing an ingredient having a notable proportion of combined water. In addition to some lack of general stability, the glass from a wet batch may show, and in many instances has shown, a greater tendency to devitrification when heated in a flame or by radiation. The amount of water left in a glass may be very small, but it has been shown to be sufficient to affect the behaviour of the glass. The only reservation to the statement that to produce the best glasses the materials should be dry is that the action of water to effect change in glasses either during their production or on subsequently heating them is, if not imperative, at least an advantage in respect of the production of certain coloured glasses and apparently of some opal glasses.

The other remark is about homogeneity. Apart from optical glasses, which must have the same composition throughout, all glasses for laboratory use should be made in such a way as to secure the greatest possible homogeneity. It is a matter of experience that glass which has been kept heated for some time, even after it is apparently "fined" and ready for working, is more resistant to heat changes and is also more generally stable than the same glass less well founded. Attempts to secure the thorough incorporation of all the ingredients by making the glass at a very high temperature were not altogether satisfactory, since there was greater attack of the pot, and, in many cases, too much loss of some of the more volatile constituents. Some glasses require very high temperatures, and problems connected with them led to investigations on materials for pots and furnaces to improve their refractory nature and so to make the production of such glasses possible. The remark about long heating applies to these glasses as well, but the attempt to substitute heating through a relatively short period of time at a very high temperature, for long-founding of glasses which only needed a moderately high temperature, led to uncertainty of composition and failed to secure the homogeneity aimed at. It is perhaps unwise to dogmatize on this matter, having in mind certain exceptions, but as a general rule it may be said that in the present state of our knowledge the long-founding so much insisted upon by many experienced glass manufacturers cannot be dispensed with if the nicest possible refinements of a good glass are to be realized.

Stirring to secure homogeneity is a necessary operation in making optical glass. It is not customary to stir glass for laboratory use, but this is not to say that such glass would not be improved by being stirred if it were economically possible to do so. Although it is outside the range of scientific glasses, the opportunity may be taken here of drawing attention to an instance in which perfect homogeneity in glass does not appear to all eyes as an advantage. The instance is that of coloured glasses used for decorative purposes, such as windows. Some of the charm of old glass seems to be associated with a marked lack of identity of composition, and, therefore, of regularity of optical properties throughout the glass. From a glass-maker's point of view it was an imperfect manufacture, but those who find depth and life in the less perfect production may ask, "Would it be imperfect manufacture to take advantage of the possibilities in a glass-melting to secure a more perfect fitness and suitability for the purposes for which such a glass is designed?" Certainly the control which modern manufacturers have over glass, and the knowledge and experience which they possess, would make it possible to secure a great variety of pleasing results.

The subject of annealing has, in recent years, been given much attention, and several investigations have been carried out. Results of much interest and importance have been obtained, dealing with the conditions for removing strain in glass and with the problem of annealing, both from the theoretical and a practical point of view. Consideration of these results serve to emphasize the importance of thoroughly annealing any glass articles which are required to withstand marked changes of temperature, and of arranging that any vessels, etc., which in the course of production are re-heated locally, shall be re-annealed. Tubing is not customarily annealed as part of the process of manufacture, but for certain purposes, notably with tubes which are to be ground, it is an advantage to anneal them.

*"Resistance" Glass.*—Laboratory glassware, to deserve this description, must possess great stability, and must part with only minute traces of any of its ingredients when it is exposed to the action of the majority of solutions and liquids used in a chemical laboratory. In the early days of the war the production of such glassware was undertaken by British manufacturers. The chief varieties made can be included in two types: one containing compounds of zinc and the other free from this metal. In neither type is the inclusion of arsenic or antimony considered to be permissible.

The following formulae, illustrative of these two types, give approximate proportions for batch mixtures expressed in percentages of the oxides contained in the various ingredients of a batch:—

| (A) | | (B) | |
|---|---|---|---|
| $SiO_2$ | 66 | $SiO_2$ | 66 |
| $B_2O_3$ | 8 | $B_2O_3$ | 9 |
| $Al_2O_3$ | 9 | $Al_2O_3$ | 2·5 |
| CaO | 5 | ZnO | 8 |
| MgO | 1 | MgO | 5 |
| $Na_2O$ | 8 | $Na_2O$ | 9·5 |
| $K_2O$ | 3 | | |

It is to be understood that adjustments of the proportions given can be made to suit different furnaces and also to fit in with the amount of broken-up glass from previous meltings (cullet), which is incorporated in the batch. The addition of cullet is customary on

economical grounds, and also because it is a matter of experience that, with a number of glasses, the desirable properties are more easily realized when notable proportions of cullet are used. Of these two types of resistance glass (A) requires a rather higher temperature in the making and on the whole presents more difficulties than (B). It has also a somewhat higher coefficient of expansion, and on that ground is less liable to withstand sudden changes of temperature. Previous remarks on the influence of long-founding for securing homogeneity and stability apply in a marked manner to such a glass as (A), and this type has been made of very high chemical resistance and of satisfactory behaviour when quickly heated or cooled through a greater range of temperature than it would usually be exposed to in a laboratory. In comparison with glass (B) it is generally more reliable for working in a flame. Several examples of the type (B) tend to show reduction of zinc in a blowpipe flame, but glasses of type (B) can be, and have been, made by British manufacturers, which exhibit none of this reduction even in a very hot flame. The general resistance of glass (B) to chemical action is good, but with hot strong solutions of caustic alkalies it does part with some zinc, and, to a very small extent, this is true of its behaviour with strong acids. Good examples of glass (A) are more resistant in the sense that they are less soluble in such reagents, but the slight action which does occur causes a roughening of the surface of the glass which is noticeable, while in the case of glass (B) the surface is left polished even though the solvent action on it may have been much greater.

Balancing the evidence of the advantages and disadvantages of the two types in their general applications to laboratory work, it is probably fair to give preference, on the whole, to glass of type (B). It is inherently more capable of withstanding sudden changes of temperature, and because it is the easier glass to make, there is less likelihood with vessels made from it of mishaps due to imperfect manufacture of the glass. Whichever class of glass is chosen, all vessels and apparatus made from it need thorough annealing.

*Combustion Tubing.*—Tubing of very hard glass is essential for many laboratory experiments, and since it is largely used in the analysis of carbon compounds by combustion it has come to be known specially in this connexion, but in tubing of various diameters it is required for a number of other purposes. Most of these preclude the use of any compounds of arsenic or antimony in the composition of batch mixtures for making the glass. Before the introduction of a new type of tubing from Jena, combustions and other operations at high temperature were carried out in a potassium-calcium-silicate glass, the best-known form of which was Kavalier's combustion tubing. The general composition of this glass is indicated by the following percentages to the nearest whole numbers:—$SiO_2$, 78; CaO, 8; $K_2O$, 12; $Na_2O$, 2. Glass of this kind served many useful purposes in laboratories, but it was difficult to use in a blowpipe flame, considerable skill being needed to work it quickly enough to avoid devitrification to an extent sufficient to roughen the surface and bring about a pasty condition which prevented the glass from flowing under heat. The Jena glass which took its place possessed greater plasticity over a longer range of temperature, and was stiff enough to allow of tubing being usable at a temperature at which the older kind tended somewhat suddenly to collapse. During the war very hard glass tubing was much needed, and as the result of experiments on a laboratory scale and in glass works, tubing of a type similar to the Jena combustion tubing was produced fully equal to any obtained before the war. With regard to hardness and suitability for working in the flame it fulfils its purpose most satisfactorily. It differs advantageously in one respect from the pre-war glass, in that it does not show anything like the same tendency to become opal when heated for a long time. The following is the composition for a batch mixture, given as for other glasses in the percentage of oxides:—$SiO_2$, 68·5; $B_2O_3$, 5·5; $Al_2O_3$, 6; CaO, 8; BaO, 6·8; $Na_2O$, 3·2; $K_2O$, 2. Remarks made about formulae for batch mixtures of glasses previously mentioned apply to this formula in respect of adjustments for addition of cullet and for some modifications to suit different furnaces. With this glass, however, there is not much latitude allowable if the full hardness of the glass is to be realized and difficulties in manufacture are to be avoided. The glass is one requiring a high temperature for its successful production, and is another example of the need for such glasses calling for investigation of refractories in order to make their production possible.

*Thermometer Glass.*—The manufacture of thermometers of all kinds has been carried on in Great Britain for many years, and British capillary tubing of high quality and technical perfection has long been available for their production. The tubing has been made both from lead glass and from various other types of glass, and has been in constant demand. An ideal glass for thermometers, in addition to being a good durable and workable glass, must be of such a nature that bulbs blown from it are constant, in that after being heated they rapidly return to their original volume. Thermometers made from such a glass would not show any change in their zero points after use. Jena thermometer tubing has gained a high reputation for close approximation to this ideal, and large quantities of it have been used by British thermometer makers. Mention should be made of the fact that at least one British glass manufacturer produced tubing also near to this ideal some years before the war. During the war very great numbers of thermometers were called for, the greater proportion being for medical purposes, but many also for scientific and industrial use. The production of these drew attention to the subject of glass for thermometers generally. Guided by their own knowledge and experiments, and assisted, in some instances, by other investigations, manufacturers of glass produced tubing to meet the demand, not only in lead glass, for the production of which they were ready and pre-eminent, but also in other varieties of glass having properties closely similar to two Jena glasses of high reputation. One of these can be used for thermometers, capable of standing high temperatures up to about 500° C., and the other is for more general application. The following formulae, given as for other glasses in percentages of oxides and with similar reservations, indicate the nature of batch mixtures for these types of glass:—

| High Temperatures | | Ordinary Temperatures | |
|---|---|---|---|
| $SiO_2$ | 73·5 | $SiO_2$ | 67·0 |
| $B_2O_3$ | 9·7 | $B_2O_3$ | 2·5 |
| $Al_2O_3$ | 5·8 | $Al_2O_3$ | 2·7 |
| $Na_2O$ | 11·0 | CaO | 6·5 |
| | | ZnO | 6·7 |
| | | $Na_2O$ | 14·6 |

*Vessels and Apparatus.*—If we turn from the character of the glasses themselves to the vessels and apparatus made from them, scientific glassware may be broadly classified as furnace-made and as lamp-blown. The former is for the most part produced by blowing into moulds molten glass gathered from the furnace on a blowing-iron. When the variety in shapes and sizes of flasks, beakers and other apparatus used in laboratories is considered, it will be realized how great a development had taken place in this direction after the war in a British industry in which, for several years, practically none of this type of apparatus had been made. So also in the lamp-blown apparatus had there been a remarkable extension in development. Before the war, lamp workers for laboratory apparatus were few in number in Great Britain and were chiefly engaged either in making a comparatively small amount of apparatus to special design or in repair work. During the war numbers of workers of both sexes were trained in lamp-blowing generally, and in 1921 those making scientific glassware were producing practically all the varieties of this kind of apparatus needed in laboratories, the best examples comparing favourably with any obtained in the past from abroad. Glass for such apparatus is supplied to the lamp blower in the form of tubing, in the production of which, therefore, there had also been a great development.

The production of scientific glassware arising out of the needs of the war was one of the most noteworthy extensions of glass manufacture in Great Britain. Since so little of this kind of glassware had been made there for such a long time, the manufacturers were not, in the majority of instances, equipped with the knowledge and experience necessary to start at once. The deserved reputation of most of the scientific glassware of foreign origin made it natural at first to attack the problem of its reproduction. It is only justice to foreign manufacturers to acknowledge indebtedness to them for a number of types to work to. At the same time it would be injustice to British manufacturers of glass to give the impression that, among the great

number of varieties which they had to make during the war for all kinds of purposes, there were not very many which were produced *de novo*, as the result of the work of a number of investigations outside, as well as inside, the industry, and of ready enterprise on the part of the manufacturers. For several of the glasses needed there were no available data to go upon, and the knowledge and experience required for guidance in the earlier stages of their production had to be gained by research.

The best examples of glasses for scientific purposes, of British manufacture, are now fully equal to any pre-war glass, and some are superior. The glasses already mentioned are the chief ones required for the production of laboratory apparatus, but they do not, by a long way, exhaust the list of glasses called for during the war for special scientific use or for industrial purposes. Examples are here briefly referred to.

For glass for miners' lamps, a glass withstanding rapid changes of temperature exceptionally well was necessary, since the lamp glasses are thick and the flame of the lamp may often touch them. There was an urgent demand for them early in the war. It was successfully met, and such glasses of British make are now produced in large quantities. Another glass on similar lines, but differing somewhat in composition, was prepared for the production of chimneys for incandescent and high-pressure gas illumination, paraffin lamps, etc. In addition to withstanding heat changes well such a glass must be markedly resistant to the chemical action of hot products of combustion. Both these glasses consist chiefly of alkaline boro-silicates having a high percentage of boric anhydride. They need a high temperature for their successful production in a homogeneous state. When well founded their low coefficients of expansion render articles made from them highly resistant to sudden variations in temperature over a long range.

Glass rods for half-watt electric lamps were required, to hold the thicker tungsten wires which support the filament of this metal. They had to be made specially, since no existing glass of British make capable of withstanding heat changes was also sufficiently reliable in respect of not cracking round the sealed-in wires. This glass in most cases involved also the production of special rods to join with it and with the stem of the lamp.

Other glasses were needed which, while making safe joints with ordinary laboratory tubing, etc., would hold platinum, copper, iron or nickel wires. Such glasses are often described as sealing-in enamels. Several of these have been made, and, generally speaking, they are of the type either of a soft glass containing a high percentage of lead, or of one free from lead and containing a notable proportion of a fluoride, such as cryolite. The coefficient of expansion of the glass, in relation to that of the metal wire used, has to be taken into account, but it is not the only factor, as may be just indicated here by the mention of a sealing-in enamel which is successful with platinum and copper but cracks with iron, nickel or tungsten.

Other glasses, and glassware from them, which had to be made during the war will be mentioned very briefly. They were of great importance, but, generally speaking, they were familiar to British manufacturers, and their manufacture did not need the extensive preliminary investigations and trials which the production of most of the foregoing glasses involved.

*Bulbs for Making Ordinary Electric Lamps.*—Before the war somewhat less than a quarter of our requirements of these was made by British manufacture. A very great extension of this part of the industry during the war was urgent. In 1918 bulbs were being made at the rate of about 1,000,000 per week.

*Jars for Preserving Fruit and Meat.*—Though numbers of these had long been made in Great Britain, about 80% of the total number used had been obtained from abroad. Great increase in the production of these vessels was required to meet the needs, enhanced as they were by the war. Bottles for a great variety of purposes had always been made by British manufacturers, but not in the great quantities which were required when sources of supplies from abroad were cut off or were inadequate. The extension of this part of the glass industry was very great even on the older lines of manufacture, but the necessity for more economic production led to a review of methods and to the adoption of new machinery.

*Glassware for Medical Purposes.*—Some of this has for many years been made in Great Britain, but not in sufficient quantities to supply the demand, and much of it was obtained from abroad. The war caused a great increase in the demand, and very large quantities of vials, tubes, syringes, graduated measures, etc., had to be made. Most of these could be produced from glass, and by methods familiar to manufacturers, but some requirements had to be met by investigation and experiment before suitable glass was produced. In connexion with medical glassware, artificial human eyes may be mentioned. For their production there are required opal glasses to suit variations in the tint of the sclerotic; bright clear glass for the lens; black glass for the pupil, and a great variety of coloured glasses for the iris; a clear glass containing fine embedded threads of opal used for imitating the irregularly radiated appearance of the iris, and a red glass for the veins of the eye. Artificial eyes had for many years been made in Great Britain, but many were imported. Most British makers of them are used to working in lead glasses, and many of their products will bear comparison with the best of foreign origin, which, as a rule, are made from glasses free from lead. Experiments for the production of such glasses as the latter furnished the data for their manufacture.

There was considerable increase during the war in the production of coloured glasses, *e.g.* for spectacles to protect the eyes of the great numbers of men working at steel furnaces. Coloured glasses in considerable variety were also wanted for other purposes, but in comparatively small amounts. Some of them needed investigation and a number of experiments before the conditions for their production could be determined.

From what has been stated already it may be gathered that a great advance had to be made in glass manufacture through needs arising out of the war, and sufficient has, perhaps, been said to indicate that the knowledge and experience gained in meeting them had placed the British glass industry in this respect in 1921 in a very different position from that of 1911.

*Optical Glass.*—Of none of the glasses already mentioned can it be said there was more imperative need for their production than for the variety of glasses required to make the numerous optical instruments used during the war. Early in it there was no doubt that the supplies of optical glass existing in England would soon be exhausted. For about three quarters of a century, Messrs. Chance Brothers of Birmingham had produced optical glass. They were enabled greatly to extend their facilities for production, in order to meet the demands which rapidly arose and were very urgent. The change which was brought about in the production of optical glass in England will be gathered from the following comparative figures. For a year or two before the war, out of the total amount of optical glass used in Great Britain, approximately 60% was imported from Germany, 30% from France, and 10% was of English manufacture. In 1916 81% was English and 19% was obtained from France, while the total quantity supplied by Messrs. Chance Brothers was about 18 times as much as they sent out in 1913 and over three times as much as the total quantity of optical glass from all sources used in Great Britain in that year. About the middle of 1917 the Derby Crown Glass Co., which was formed in the autumn of 1916 for the manufacture of optical glass, was supplying it. Figures for the first quarter of 1918 show that 96% of the optical glass used in Great Britain was made at home, while France supplied only 4% of the British requirements. In that first quarter the output of optical glass made in England was about nine times as much as the total quantity of English manufacture produced in the whole of 1913, and it was being made at the rate of an annual production of more than six times the total quantity of optical glass from all sources used by British optical instrument manufacturers in 1913. This great increase in production was due entirely to the war, since during it very little optical glass was used for purposes other than the manufacture of instruments for the fighting services. The compulsory extension of manufacture called mostly for development in quantity production rather than increase in the number of types manufactured. A few types not hitherto made in England have been produced; but Messrs. Chance Brothers for some years have manufactured a number of glasses having properties similar to several types of Jena optical glass. Both this firm and the Derby Crown Glass Co. have been called upon for glasses having pre-determined optical constants, and the meeting of these demands has involved a considerable amount of investigation and experiment. No completely new type of optical glass has been manufactured; but in some instances the requirements of the optician have necessitated a departure so marked as to constitute an extreme variety very like one.

It is not easy to suggest a strict definition of "type" as applied to optical glass. The two types of earlier days were "flint" and "crown" the former containing lead oxide and the latter calcium oxide along with alkalies and silica. The names are convenient, as their connotations are understood and they have become conventional; but a glass free from lead may be

used as the flint, and one containing lead may be employed as the crown, in some optical combinations of lenses. For practically all the optical glasses other than the old flints and crowns the optical industry is indebted in the first instance to the researches and manufacture carried out at Jena. Many substances not used before in the production of glass enter into their composition, and it would seem preferable to restrict the expression types to such glasses as have markedly different chemical compositions. It is not necessary to elaborate this point here. It is mentioned only to indicate a distinction between the comparatively few distinct types of optical glasses which have been made and the large number of varieties of them which are needed to provide for the many differences in optical constants asked for by opticians.

Investigation and experience have enabled the English manufacturers of optical glass to go far in satisfying the demands of the manufacturers of optical instruments of all kinds; but there is still room for much experimental research for glasses and transparent media nearer to the ideals present in the minds of designers of optical systems.

With regard to homogeneity, freedom from colour and durability, optical glasses made in England have reached a high level. During the war, in spite of the fact that production had to be so largely increased, the good qualities of the glass generally were not only maintained, but in many instances of glasses somewhat difficult to make a high quality was reached, at least equal to the very best which was available before the war. With the experience gained in recent years improvements of manufacture are possible which point to a greater percentage of yield of high-quality glass than has hitherto been obtained from any melting. The use of more efficient mechanical means for handling pots of glass, the production of pots more highly resistant to the chemical action of molten glass, increase of the durability of some of the less stable glasses, ready production of large homogeneous masses of glass, and the production of new glasses, are the lines along which future progress may be expected, and are the developments indicated during the great activity in the British optical industry owing to the war.

No attempt can be made here to discuss the compositions of the various glasses which have been produced, or to deal in any detail with the range of optical constants now available. Before leaving the subject, however, the relevancy of the problems connected with optical glass to the production of some other glasses may be mentioned. It is a matter of experience that the numerous researches required for the production of various types of optical glass have a considerable value, not only in arriving at the immediate end in view, but also because the knowledge obtained of the properties of glasses of very varied chemical composition is of the highest importance in pointing the way for designing many glasses for other scientific purposes, and also for certain industrial use. This applies not only to the actual glass, but also to several considerations in respect of furnaces and refractories.

Acknowledgment must be made here of the work organized in England during the war by the Department of Scientific and Industrial Research; of work and investigations carried out by the National Physical Laboratory; of the practical investigations by a committee of the Institute of Chemistry; of the work and investigations undertaken by the glass technology department of the university of Sheffield, and of the guidance and stimulus given by the department of the Ministry of Munitions, which, concerned at first with optical glass only, soon became responsible for supplies of glass and glassware of all descriptions.

*Progress in the Use of Machinery.*—It is probable that between 1910–21 the greatest advance in the economic production of certain types of glassware was in the direction of the introduction of machinery and minor labour-saving devices in substitution of the older hand methods employed in production. Naturally this substitution was only rendered practicable by concurrent improvements in the means for assuring a continuous supply of molten glass in a suitable condition to permit of the machines being run continuously. It will, therefore, be understood that whereas the common practice in the past has been to found the glass in pots in direct-fired furnaces, there has been a gradual tendency for tanks, some of them being of very large capacity, holding as much as 300 tons of molten glass, to take the place of the older pot furnaces. It is scarcely possible that the pot furnace will entirely disappear from practice, inasmuch as those glasses which are only required in comparatively small quantities or of absolute purity, as in the case of optical glass, certain coloured glasses, and those liable to contamination from furnace gases, will still have to be pot-founded.

The development of machinery in glass manufacture has been by gradual evolution. In general the earlier efforts were directed towards imitating by mechanical means the sequence of the operations performed by the skilled glass worker; and we find, therefore, that skilled labour was not suddenly displaced. The earlier machines were partly automatic or semi-automatic, and required a gatherer, a human link between the furnace and the machine, and also a boy to take and transport the finished article from the machine to the annealing lehr. The human links have now been dispensed with in many American factories; neither the raw materials nor the glass is handled at any stage during the progress of manufacture. Conveyors transfer the raw material from the trucks to the storage bin; automatic weighers discharge the requisite quantity of material from the storage bin to a rotary mixer mounted on a trolley; another conveyor transfers the mixed batch to the batch storage bin in close proximity to the charging end of the tank, for the ready release of the batch down a chute at periodic intervals into the tank.

Although machinery has entered so largely into glassware production, there are still some few operations where man has not been displaced. This is more particularly in evidence in the production of many types of chemical glassware produced by the glass-blower with the aid of a blowpipe, the beautiful specimens of cut table-ware, the handiwork of the craftsman skilled in the use of the grinding wheel and polishing pads, and other ornamental ware.

The types of machines may be conveniently divided into the following groups:—pressing machines for the production of tumblers, meat and jelly jars, bull's-eye lenses, tableware and pavement lights; press and blow machines for all types of bottles, and many kinds of food containers; blow machines for electric lamp bulbs, lamp chimneys and similar articles; rolling machines for plate glass, figured and ribbed glass and reinforced sheet for sheet and window glass, and for drawing tubes and rods.

In addition to the glass-forming machines there are many other types for miscellaneous purposes, including cracking-off machines for severing the fashioned article from the waste glass, employing multiple fine jets of flame which impinge on the line of severance. This line is usually started by a short diamond cut at the predetermined point. Calibrating machines for accurately dividing measuring devices such as thermometers, burettes, pipettes and cylinders; grinding and polishing machines for preparing and finishing the surface of plate glass; machines for forming the stoppers of bottles and for grinding the seating in the neck of the bottle; flowing devices and feeding machines, to take the place of the gatherer and his operation of withdrawing from the pot or tank, by means of a gathering-iron, a sufficient quantity of molten glass to make the article required.

It will be readily appreciated that in common with certain other industries the development of glass manufacture has made remarkable strides on the engineering side. The advance is the more marked, inasmuch as the progress made in other essentials has not been commensurate with mechanical progress.

*Press Machines.*—No very marked advance has been made in recent years in this type of machine so far as principle of operation is concerned, but there has been constant improvement in detail. It will be appreciated that a very limited number of types of article can be made with a solid mould. Only such as have both an internal and external taper, the diameter being reduced in the direction of the movement of the plunger, are suitable. In all other cases where the ware has external shoulders or ornament, the mould must be hinged. In the semi-automatic and fully automatic machines the movements of the plunger and mould are operated by compressed

air. It is in the control valves and mechanism for operating the moulds that improvements have been effected. In the earlier press machines the plunger was directly connected with the piston, resulting in an equal pressure throughout the stroke. The later types in which the power is transmitted through toggles are much more efficient, since a slower motion and increased pressure are obtained as the plunger nears the end of its stroke. This arrangement conforms to what has been found to be the best practice in using the hand-lever press. If too much glass be fed into the mould, less pressure is required to form the article than if there is a comparative shortage of glass when a heavy pull is required on the lever. The toggle machine, therefore, is adapted to compensate for variations in the quantity of glass fed into the mould.

In another type of press machine a series of moulds is arranged on a rotating plate, and by means of air pressure the mould containing the molten glass, when it reaches a point immediately beneath the plunger, is forced upwards to meet the fixed plunger. This type of machine is employed in making deep pressed ware such as tumblers and is usually adapted only to solid moulds. Press machines naturally vary very much in size according to the ware to be produced. Probably the largest of its kind is one operated in America for the production of glass burial caskets, which measure up to 6 ft. 3 in. in length. The machine weighs about 6 tons, and is capable of developing a pressure of about 700 tons.

*Press and Blow Machines.*—This type of machine is used in greater numbers and of more varied forms than any other class of glass machinery. It is essentially the bottle machine. It may be interesting to note that the first attempt to produce a machine for making bottles was the work of an Englishman, although it is to American skill and enterprise that the successful development of this complex machine is due. A press and blow machine is designed to perform two distinct operations. In the first the neck of the bottle is formed by pressure in what is known as the parison mould, and in the second the body is blown and finished in the blow mould. In general the machine consists of two circular plates, either disposed one above the other and capable of a step by step rotation about a central pillar, or arranged side by side, the second being driven from the first by an intermediate pinion or gearing also by a step by step motion. At regular intervals near the periphery of one plate (the upper one in the first case) are situated the parison moulds for forming the neck, and on the other plate similarly situated are the blow moulds for forming the body. All the necessary movements, including the rotation of the plate, the actuation of the plunger, the automatic opening and closing of the moulds, and the transfer of the blank from the parison mould to the blow mould are performed by air pressure. In certain types of machine the last-mentioned operation is not performed automatically, but by hand.

The sequence of operations in making a bottle on such a machine is as follows. A supply of molten glass is fed into the blank mould, either by one of the various types of automatic feed or by a gatherer using the usual form of punty rod. A blowing head then makes contact with the mould and blows the glass down on to the plunger, thus forming the neck of the bottle. The plunger is withdrawn, and the table advanced to the next position. A puff of air is blown into the orifice, to blow the glass to the full size of the blank mould. Again the table advances, and at the third position the mould opens and the glass blank is transferred to the blow mould situated on the second table. This mould closes round the glass, and the blowing head takes up the correct position to supply the necessary air pressure to blow the bottle to the required shape. The mould again advances and opens at the next position when the finished bottle is removed and transferred to the annealing lehr. Considerable difficulty was experienced in producing satisfactorily small narrow-necked bottles, but within the last few years the difficulties have been overcome and satisfactory results have been obtained on fully automatic and semi-automatic machines. Naturally the speed of production depends on the type of machine and the size of the ware being produced, but the capacity of some of the later types of machine may be gathered from the fact that eight or nine bottles of one quart capacity can be produced in one minute, and smaller even faster.

*Blow Machines.*—The use of this type of machine is not nearly so common as that of the press and blow machine. They are principally used in the production of electric lamp bulbs, lamp chimneys, tumblers and similar light hollow ware. The main difference and special feature of these machines is that the moulds are coated internally with carbonized material, and the article is rotated in the mould during the period of blowing. It is therefore obvious that ware produced in such a mould must have a smooth regular surface, and any kind of figuring or ornamentation is out of the question. These machines may be semi-automatic, in which case a gatherer is necessary to feed the required quantity of glass to the machine, or they may be fully automatic, in which case the machine sucks up the molten glass from the tank. The former type of machine comprises generally four vertical frames mounted on a cast-iron base frame. A horizontal shaft carrying four circular discs runs in suitable bearings situated at the head of the vertical frames. Mounted loosely on the shaft and close to the discs are four arms, which, by means of suitable cams and tripping devices, can be rotated between a horizontal and vertical position. Each arm is provided with a small air pump at its extremity. On a level with the arm when in the horizontal position is a small disc, which serves the purpose of a marverer. This disc, mounted in a bearing attached to the back of the frame receives its motion from the vertical disc. A suitable mould disposed at the base of each vertical frame is mounted on a horizontal spindle capable of movement through 90°. When in the horizontal position, the mould is submerged in a trough of water situated in the base casting. The moulds are hinged, and the opening and closing movements are effected by a rod at the back.

The sequence of operations in making an electric bulb is as follows:—A gatherer having withdrawn from the pot or tank a mass of glass on his blowpipe secures the latter in contact with a rubber washer, forming part of the air pump at the end of the machine arm when the arm is in a horizontal position. The mass of glass on the end of the blowpipe, which is slowly rotating, comes into contact with the marverer, which is also rotating in the same direction. After a short period a cam comes into operation, causing a slight puff of air to be given to the glass through the blowing iron. The arm now assumes a vertical position with the glass at the bottom, and at the same time the mould takes up a vertical position, and the operator by pulling a lever causes the mould to close over the glass. Whilst the glass still attached to the end of the blowpipe is kept rotating in the mould, a puff of air is admitted through the blowpipe and expands the glass into the desired bulb. The operator then opens the mould, withdraws the blowing iron from the machine, and places it in an adjacent stand, when another operator severs the bulb from the iron with shears; the iron is cleaned off and is again ready for use.

A brief description of the other type of machine, which is fully automatic, is as follows:—The machine rotates by a step by step movement about a vertical axis at the rate of about two revolutions per minute, and is provided with six double arms actuated by cams disposed on a vertical drum. The first operation is the projection of the cantilever head into the furnace, when glass sufficient for two bulbs is sucked up by vacuum into the blank moulds; the cantilever head then withdraws and the glass blanks are released and deposited in cups. The cantilever heads are capable of being rotated about a horizontal axis, and the cups are in their top position when receiving the glass. At this point a rod is forced up into the glass to form a hole for the blowing operation. The machine is rotated to the next position and the head moves into the horizontal plane when the glass blank receives the first puff of air; at the next rotation of the machine the head assumes a vertical position with the partly formed bulb hanging downwards. At this stage either a reciprocating or a swinging motion is imparted to the head in imitation of a hand-worker's movements. The mould is then raised, and closes over the partly formed bulb, and a final puff of air is given. The next rotary movement of the machine opens and lowers away the mould, and the finished bulb is removed by hand. From the time that the glass is fed into the cups of the head until the bulb is blown the glass is kept rotating. Before the mould is again brought into operation it passes through a mixture of soap and water.

*Sheet or Window Glass Machinery.*—The earlier attempts to manufacture window glass by machinery better illustrate the tendency to imitate the methods which had proved by long practice to be best suited to production by hand. The objective of all the earlier machines was the production of as perfect a cylinder of glass as possible. Patents and improvements related rather to modification of detail than variation of first principles. The general method employed in this type of machine is to bring a ring or circular bait of metal into contact with the molten glass, to raise the bait by mechanical means, and at the same time supply air under a low but increasing pressure into the cylinder of glass so formed.

The following will give in brief the outline of a machine which is being successfully worked at the present time:—A pot or receptacle about 3½ ft. in diameter, and of a depth sufficient to hold the quantity of glass required in making a cylinder is charged by means of a ladle with molten glass taken from a tank furnace. A structure alongside the pot is so arranged as to permit of a bait being raised vertically by means of a motor to the full height of the cylinder to be drawn. The bait, which consists of a short hollow cylinder about 1 ft. in diameter, furnished with an internal lip at its lower end, is lowered into the molten glass contained in the pot, which has been left standing for a short time until the glass has attained the correct drawing temperature. As the bait is lowered the glass flows over the lip and solidifies, thus forming a starting point for the cylinder. An operator standing on a platform well above the pot level starts the motor, which raises the bait, and at the same time air under pressure is admitted through the top of the bait. The cylinder of glass quickly increases in diameter, and the pressure of air is arranged to give the desired dimension. In order to ensure a uniform thickness of wall, both the speed of drawing and the pressure and volume of air are increased to counteract the increased viscosity of the glass due to falling temperature. When the full cylinder, 40 ft. long and weighing about 1,000 lb., has been drawn, it is cracked off from the pot; the lower portion is swung out and the cylinder lowered into a horizontal position; the top portion or can is cracked off and the remainder is divided into convenient lengths for handling; these are usually about 5 ft. long. The remaining processes of slitting and flattening are similar to those followed in hand-made cylinders.

In a later, and not yet so widely used, type of machine the sheet is drawn directly from the tank and requires no subsequent flatten-

ing treatment. The tank is furnished with an extension at the refining end into which the glass flows and cools sufficiently to be drawn. When in a proper condition, an iron bait in the form of a narrow iron plate is lowered into the molten glass, which welds to it. By means of a hand-actuated device the bait is raised; the sheet of glass following it is drawn through a pair of narrow water-cooled rollers arranged at each side of the sheet, which assist in maintaining its width, and then over a hard and highly polished roller situated about 30 in. above the drawing pot. Here the glass assumes a horizontal position. In the neighbourhood of the bending roller, additional heat is applied to the sheet to prevent any possibility of cracking; the sheet of glass then passes over a flattening plate and enters the annealing lehr. At this point a caterpillar drive pulls the sheet along and furnishes the power for the automatic drawing of the sheet. It will be seen, therefore, that the process is continuous so long as a supply of glass is available. By this process sheet-glass can be produced which may be of any predetermined thickness within wide limits, the governing factors being the speed of drawing and the temperature of the glass in the draw pot. The width of the sheet is about 6 ft., and the speed of drawing for the thin variety is about 2 ft. 6 in. per minute. At first there was a tendency for the glass manufactured by this process to be somewhat cordy, probably due to the surface cooling in the drawing chamber, but this has been overcome and the product is now of very good quality.

In the Belgian method of drawing sheet-glass the space above the glass in the tank is divided into two parts by means of a brick curtain which depends from the roof to a short distance below the surface of the glass; by this means the flame and hot gases are restricted to the melting end. Subsidiary ports are provided in the refining end to regulate temperature. In the refining end of the furnace two further similar brick curtains are arranged parallel and comparatively close together; between them floats a *débiteuse*, a hollow vessel made of fireclay or similar refractory material, rectangular in plan and with rectangular ends, but having a section to within a short distance of each end somewhat like an inverted M with the apex of the central angle cut off, thus leaving a long narrow slit giving access from the outside to the inside of the receptacle. This device has a specific gravity slightly less than that of glass; it floats, therefore, in such a position that the narrow central slit is just below the surface of the glass. Above the refining or drawing end of the tank, an erection in the form of a square tower about 13 or 14 ft. high, made of sheet iron lined with refractory material, is provided. On opposite sides of this tower are sets of double resilient rollers disposed vertically, and so arranged that when the sheet of glass is being drawn the edges of the sheet will pass between, and be gripped by, the rollers. The rollers on one side are driven by suitable gearing from an electric motor.

In drawing a sheet of glass a bait consisting of a narrow flat woven iron sheet of a length equal to the length of the slit in the *débiteuse* is lowered within the lips forming the slit. When the glass has welded to the bait the latter is raised, lifting with it a sheet of glass. By means of a water-circulating system the glass is chilled sufficiently to retain its form and then passes up between the rollers. When once gripped by the rollers the upward draw is continuous so long as the motive power is applied to the rollers. The bait is removed when the sheet reaches the top of the tower. The tower is provided with a series of inclined iron diaphragms, the upper part of each of which is flush with the rollers. These diaphragms serve the double purpose of preventing broken glass from falling into the tank, and of preventing the heat from the tank ascending the tower. By this means a rough annealing is performed, since the ascending sheet of glass is subject to a gradually falling temperature. When the sheet reaches the top of the tower it is cut to size and packed.

*Plate Glass.*—No special innovations have been introduced in recent years in the methods of manufacturing plate glass, with the exception of the means for annealing the plates. In the older method the plates are placed on the floor of a kiln when the latter is at a dull red heat; the opening is then built up and luted with fireclay. The heat is shut off, and the kiln allowed to cool gradually over a long period. Recently, however, a plant has been installed in the United States for annealing the plates in a continuous lehr, and it is claimed that the glass is equally well annealed as in the old process. The time saved is considerable, being five hours as against three days by the kiln method.

After the glass has been melted in a pot, the latter is taken bodily from the furnace, and the glass poured on to the rolling table, about 28 feet x 16 feet. This consists of a large cast-iron bed, usually made up in segments, carefully bolted together so as to give an even smooth surface and cooled by a water circulating system. A large roller extending the full width of the table, and weighing from 5 to 6 tons, is mechanically driven forward and spreads the glass out into a sheet. Guides are provided at each side of the table upon which the roller bears; the height of the guides governs the thickness of the sheet formed. The plate having been rolled is moved forward into the first section of the lehr, which is maintained at a temperature of about 600° C., and then progresses by an intermittent motion through the other sections of the lehr. The floor of the first sections of the lehr is made up of fireclay slabs, and, in the cooler sections, the glass moves forward on wooden slats or battens, the total length of the lehr being about 400 feet. As a fresh plate is rolled about every ten minutes, this fixes the period during which a plate remains in any one section of the lehr. After leaving the lehr the plates are carried by a travelling crane to the grinding and polishing shop.

*Tube Drawing Machine.*—There are two types of machine, the semi-automatic and the fully automatic. In the semi-automatic machine the mass of glass on the blowing iron is prepared as in the case of drawing by hand. The drawing machine is installed in a tower about 170 ft. high, in the basement of which is a motor-driven winding drum. A steel wire rope connected to the drum runs straight to a fixed pulley at the top of the tower and down again to the blowpipe carriage. The carriage is therefore raised or lowered when the drum is operated. The carriage is provided with means for securing the blowpipe, and also with four rollers which permit it to move freely between vertical guides. The glass having been prepared on the blowing iron, a punty is secured to a socket between the vertical guides; the glass, still on the blowing iron, is lowered on to the upper face of the punty and adheres to it; the blowing iron is then locked in its carriage and the motor started. The speed of the draw governs the size of the tube, which may be regulated by means of a variable speed on the motor. The tube having been drawn, it is parted from the punty, and by means of a band brake gradually lowered and cut up into lengths. Practically any type of tubing can be drawn on this machine, inasmuch as the finished product depends upon the form imposed upon the glass by marvering and blowing prior to being put into the machine.

In the case of the fully automatic machine only tubing having a circular section can be drawn. Glass is ladled from the melting furnace into a specially constructed pot, heated by a system of burners and provided with a baffle extending from the top of the pot down into the glass, and also with an orifice from which the glass flows regularly into a rectangular clay trough. From a small opening in the trough, the size of which can be controlled, the glass flows, in the form of a ribbon, on to a revolving cone. The cone is hollow and made of fireclay, and varies in size according to the tube to be drawn. Longitudinally through the centre of the cone is a steel tube with a nicrome steel cap. This tube is for supplying air to the interior of the glass tube being drawn, and also serves as a means for rotating the cone. The speed of revolution can be governed by the motor. The axis of the cone is inclined so that the apex is depressed. The ribbon of glass from the pot flowing on to the larger diameter of the cone tends to flow by gravity towards the apex, and soon after starting the whole cone is covered with molten glass; the flow continues beyond the end of the cone and maintains its form of a hollow cylinder owing to the air under pressure which is admitted to the central tube. At this stage the glass tube is much larger in diameter than the finished tube, but by the time it has reached a series of pulleys in line the diameter has been reduced to the desired size, and it has cooled sufficiently to retain its form. It continues to pass over the series of pulleys until at about 150 ft. from the pot the tube passes between, and is gripped by, two endless chain belts faced with asbestos sheet pads. As soon as the tube is gripped by the belts a steady pull is maintained. The speed at which the belts travel, combined with the temperature of the glass at the cone, determines the size of the tube. After passing the belts the tube is cut into lengths automatically; they fall into a tray of a rotary conveyor, where they are automatically sorted into separate racks.

*Automatic Flowing and Feeding Devices.*—Various forms of feeds have been devised for delivering a pre-determined quantity of molten glass from a tank furnace to the glass-forming machine. In all of these it is essential that the supply of glass should be maintained at a constant level, and it follows, therefore, that these devices have been applied either to tank furnaces or subsidiary containers which are constantly replenished.

The most primitive form of feed consisted of a simple overflow from a spout or lip with a stream of glass cut at periodical intervals by means of a pair of blades actuated automatically and water-cooled, and an improvement on this form of feed provides for the substitution of one of the blades by a series of cup-like devices fixed at the ends of radial arms rotating from a common centre, in such a way as to bring the cups in succession under the stream of glass. Each of these cups rotates about its own horizontal axis.

At the moment when a mould has been sufficiently charged the edge of a cup meets the moving blade, scissor fashion, in the line of the stream of glass. The glass now falls into the cup which is gradually rotating about its axis. During this part of the operation a new mould has taken up its correct position, the cup continues to rotate and pours the accumulated glass into the mould, into which the now unimpeded stream of glass also falls. The next following cup again intercepts the stream and so completes the cycle.

In another type of feed a spout is provided at the working end of the furnace. On the under-side of the spout there is a hole capable of being varied in size. A pair of shears automatically cuts off the glass as it flows from the hole, after which a timing device retards the flow of glass. This governs the quantity of glass delivered.

In another type of feed the glass is delivered by a reciprocating paddle working in a specially devised extension to the tank. The mass of glass which is forced over the lip of the receptacle by the paddle is severed by suitably actuated blades. The mass of glass falls on to an inclined chute, water lubricated, and is delivered into the glass-forming machine.

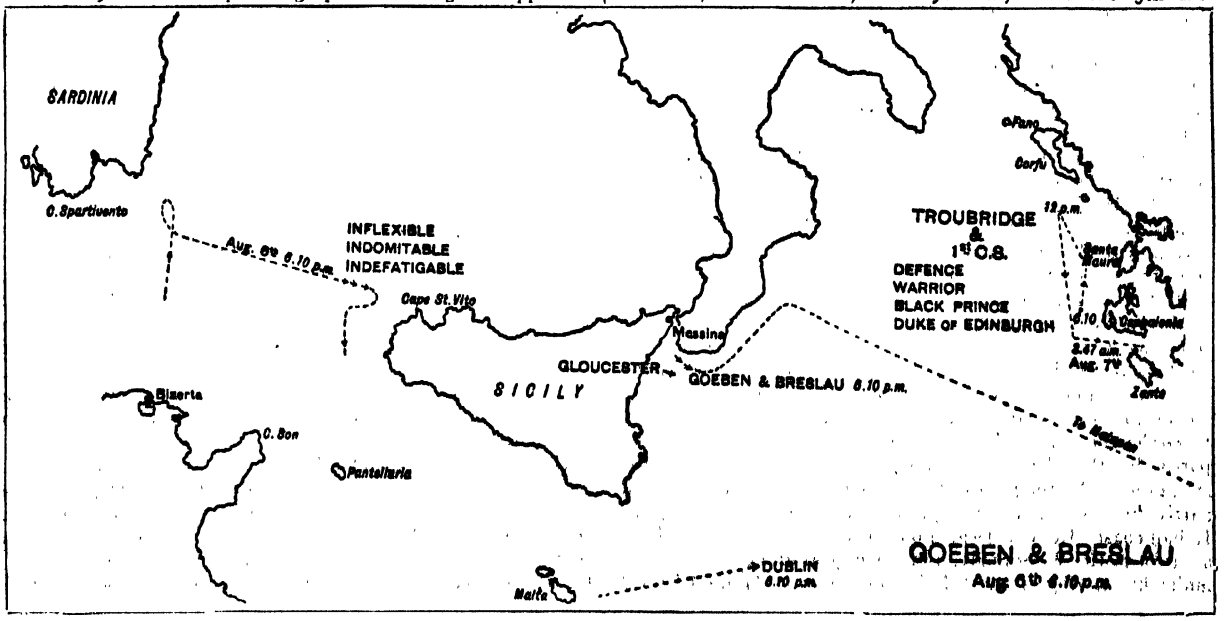
*Refractories and Pots.*—With the introduction of more efficient pot furnaces and tanks in which higher temperatures were reached it soon became evident that the question of refractories would have to be investigated in order that the pots, tank blocks and furnace parts, would stand up to the increased strain which was being put upon them. During the war a large amount of experimental and practical work was undertaken with a view to improvement in this direction. As a result of some of these investigations a provisional specification was drawn up for the help of users and makers of refractories, and it was hoped by this means to standardize the types of clay, percentage and size of grog, porosity, shrinkage and other factors necessary in production of the refractory articles used.

Evidence would appear to point to the fact that in so far as concerns the majority of types of optical glass, and, if it were an economical proposition, for other glasses also, pots of a porcelain nature or of a composition approximating in relative proportions of alumina and silica to kaolinite have given the most satisfactory results. In connexion with the manufacture of optical glass in America for war purposes it was found as a result of considerable experiment that a pot of the porcelain type was the best suited to their purpose. In other directions considerable experimental work has been devoted to the production of pots by the ordinary casting and by the vacuum casting processes, and also of pots from osmose clay. In each case results of great promise have been obtained.

*Furnaces.*—There is no doubt that the exigencies of the war in relation to glass production caused British manufacturers to consider very seriously the equipment at their command in respect of its efficiency and quality of output. Although in some instances a reasonably efficient type of furnace had been installed, the general run of furnaces, although satisfying the type of work performed in Great Britain before the war, were unable to attain or maintain the necessary temperatures for producing certain essential kinds of glass for the supply of which the British consumer had previously relied on foreign sources. In factories existing at the outbreak of war the more efficient furnaces were of the regenerative type, but in the recently erected pot furnaces the tendency has been to adopt the recuperative principle. In this type of furnace there are two sets of channels or passages, one for the air supply and the other to carry away the hot products of combustion; the temperature of the air is raised due to interchange of heat by conduction through the common party wall of the channels. As the flow of the secondary air and hot flue gases are constant in direction, there are, therefore, no reversing valves to be operated as is the case in the regenerative type, and it is claimed that the furnace can be maintained at a more even temperature in the former than in the latter.

The recuperative type of furnace is producer-gas-fired. The furnaces, according to the designer, differ in respect of the disposition of their elements; in one type both the producer and recuperators are situated immediately below the furnace, and both the air passages and hot flue gas passages are disposed horizontally, whereas in another type the recuperators are at the sides, and the air passages are vertical whilst the flue gas passages are horizontal. It is claimed for the latter type that glass from a broken pot can be more easily dealt with and is not likely to cause so much damage.

*Oil Fired Furnaces.*—Oil firing has not been installed to any extent in the glass industry in England and in very few, if any, cases has the furnace been designed specifically for oil fuel. But the coal strike in 1921 and consequent high price and irregular supplies of coal caused attention to be more particularly directed to oil as a fuel, and during the first half of 1921 some optical glass furnaces in England were fired with heavy oil.



From experience gained so far it would appear that better results were obtained with the heavier grades of oil, and that tank furnaces lend themselves more readily to this type of fuel. In the case of pot furnaces the objection is raised that the pots are liable to suffer on account of the irregular heating due to localized combustion.

The prospect of increased consumption of oil as fuel has led naturally to efforts being made to improve the existing types of oil burners in the direction of better efficiency, etc. Several oil burners are now on the market, in some of which atomization is effected by steam under pressure. In others mechanical means and air pressure are utilized. Although more complete atomization is obtained by the former means, yet it appears to be generally admitted that the burner utilizing air pressure with some mechanical means for assisting atomization gives more complete combustion and higher temperatures. The virtue in this method of firing is increased cleanliness and the absence of discolouration or deterioration of the glass, due to the effects of the flame coming into contact with it. Moreover, with oil fuel the temperatures can be more easily controlled.

*Annealing.*—Prior to the war a very wide gulf separated the methods in use for annealing optical glass from those practised by the makers of other types of glassware. In the former an efficient system of well-lagged electrically heated towers ensured a satisfactory result. In the latter, however, a primitive, straight-through tunnel (usually coke heated) formed the lehr. It was open to the objection that it was exceedingly draughty and the glass was hurried through in all too short a time. During the war, however, when new types of ware had to be produced in which the annealing needed to be above suspicion, close attention was devoted to the subject of improved lehrs. In many of the factories considerable care was exercised to ensure efficiency in this operation. The site was well chosen, the system of heating was considered in relation to the necessity of a variation in the maximum temperature according to the class of ware being annealed, and of a gradual fall in temperature after passing the hottest zone. Precautions were taken to prevent draughts sweeping through the lehr and so defeating the object of the operation. (H. Jn.; S. W. M.)

**"GOEBEN" AND "BRESLAU."**—The "'Goeben' and 'Breslau' incident" forms an interesting part of the naval history of the World War, since the escape of the German battle-cruiser "Goeben" from Messina on Aug. 6 1914 enabled it to proceed to Constantinople and to exercise a powerful influence on Turkey and the outcome of the war.

When the war broke out the British forces in the Mediterranean under the commander-in-chief Vice-Adml. Sir A. Berkeley Milne consisted of three battle-cruisers: the "Inflexible" (flag.), "Indomitable" and "Indefatigable" (each eight 12-in. guns, 23 knots); the 1st Cruiser Squadron (under Rear-Adml. E. C. Troubridge): "Defence" (four 9·2-in., ten 7·5-in.), "Black Prince," "Duke of Edinburgh," "Warrior" (each six 9·2-in., ten 6-in.); the four light cruisers, "Chatham," "Dublin," "Gloucester," "Weymouth," and the 5th De-

stroyer Flotilla of 16 destroyers. The French forces under Vice-Adml. Boué de Lapeyrère numbered one Dreadnought (the "Courbet," twelve 12-in.), six "Dantons" (Lord Nelson type), nine older battleships, six armoured cruisers and 24 destroyers. The German forces under Vice-Adml. Souchon consisted of the battle-cruiser "Goeben" (ten 11-in., 26 knots) and the light cruiser "Breslau."

The original British war orders for the Mediterranean were to concentrate at Malta and watch the entrance of the Adriatic; these would have met the circumstances of the case, but they were modified by a series of Admiralty telegrams. The British fleet was at Malta on July 29. On the 30th the Admiral received instructions that his first task was to aid the French in their transport and bring the "Goeben" to action if it attempted to interfere. These instructions were apparently sent without the concurrence or knowledge of the French commander-in-chief, who had not asked for British assistance. On Aug. 1 news came of the "Goeben" and "Breslau" at Brindisi and they proceeded to Messina unknown to the British commander-in-chief. On Aug. 2 about 2:45 P.M. he received orders to shadow the "Goeben," watch the approach to the Adriatic and remain near Malta himself. He accordingly took up his station off Malta and sent Troubridge with the "Indomitable," "Indefatigable," the 1st Cruiser Squadron and four destroyers to watch the entrance to the Adriatic. About 8 P.M. he was told he could get in touch with the French commander-in-chief for combined action, but was unable to establish communication and remained ignorant of the French plans. Early in the morning of Aug. 3 the commander-in-chief, in answer to a question on the subject, was told that he was to maintain his watch on the Adriatic but the "Goeben" was his objective and was to be followed and shadowed wherever she went.

The "Chatham" had looked into Messina on Aug. 3 at 7 A.M. but there was no sign of the "Goeben" there (she had left to bombard the Tunisian coast), and the commander-in-chief accordingly recalled the "Indomitable" and "Indefatigable" on their way to the Adriatic and sent them to the W. to look for the "Goeben." He was very much handicapped by his ignorance of the French dispositions and the Admiralty supplied no information on this point. The Admiralty now became anxious about the Atlantic trade routes and at 8:30 P.M. an order arrived for the "Indomitable" and "Indefatigable" to proceed to Gibraltar at high speed and they went off at 21 knots. The "Goeben" and "Breslau" had been bombarding Philippeville and Bona, and, by a stroke of good luck, the "Indomitable" and "Indefatigable" on their way to Gibraltar ran right into them returning to Messina 40 m. N. of Bona on Aug. 4 at 10:32 A.M. The British battle-cruisers turned to the E. and followed at 11,000 yards. The day was misty, the "Goeben" 3 knots faster, and by 4:35 P.M. she was out of sight. Meanwhile the commander-in-chief had received news of Italian neutrality during the afternoon and an order not to approach within 6 m. of the Italian coast. This was a very exceptional restriction, far in excess of the requirements of international law, and was cancelled on Aug. 6 at 7:46 P.M. after the "Goeben" had escaped. It seems to have arisen from some confusion of ideas regarding the committal of acts of hostility within neutral waters, but its effect was to debar Adml. Milne from the use of Messina Straits and hinder the immediate concentration of any forces stationed at the two entrances.

Meanwhile the "Indomitable" and "Indefatigable" were following E. on the track of the "Goeben" and were between Sardinia and Sicily when at 6:50 P.M. (Aug. 4) they received orders from the commander-in-chief to steer W. and go slow, which meant turning round and abandoning the pursuit. In giving this order the commander-in-chief seems to have been influenced partly by the idea of covering the French transport route, strengthened by the report of a German collier at Majorca, and partly by the Admiralty injunction against approaching the Italian coast. He now decided on the same grounds to establish a patrol to the W. of Sicily, and when hostilities commenced at midnight on Aug. 4 the "Inflexible" was in Malta Channel steering W. to join the "Indomitable" and "Indefatigable" in order to do so. The "Goeben" was just returning to Messina. Troubridge with the 1st Cruiser Squadron was about 60 m. W. of Zante. The "Gloucester" was watching the S. entrance to Messina. The "Goeben" had arrived at Messina early in the morning of the 5th and started coaling, but there were difficulties in her way and the work was slow. News of her arrival only reached London at 6 P.M. and did not reach the British commander-in-chief till 4 A.M. on Aug. 6, though the "Gloucester," on the strength of wireless indications, had reported she must be there. A still more important piece of news never reached the commander-in-chief, namely that the Italian authorities had given her 24 hours to leave the port. During the night of the 5th the commander-in-chief continued to patrol with the "Inflexible" and "Indefatigable" in what is now seen to be an absurd position between Bizerta and Sardinia, while the "Indomitable" was coaling at Bizerta. At 6:10 P.M. on Aug. 6 he was 15 m. off Cape S. Vito (the N.W. point of Sicily; *see* map) when the "Gloucester's" wireless began to sound. The "Goeben" and "Breslau" were leaving Messina to the south.

The commander-in-chief did not display any great haste in following her to the East Mediterranean. He seems to have known very little of the ticklish state of affairs in Turkey, and had merely been told that the Turks were mining the Dardanelles. He proceeded at a moderate speed (15 knots) to Malta, arriving there with the battle-cruisers at noon on Aug. 7 just as the "Goeben" was approaching Cape Matapan. Adml. Souchon had been left at liberty to act as he might see fit and on leaving Messina it was his intention to proceed to the Dardanelles. He made a feint of steering N. till about 11 P.M. but the "Gloucester" followed and signalled his every move. Rear-Adml. Troubridge was off Cephalonia at 6 P.M. on the 6th (*see* map) and, thinking he was making for the Adriatic, steered with the 1st Cruiser Squadron for Fano I., but, concluding at midnight that the first course was a feint, altered course and proceeded S. at full speed. He had already informed the commander-in-chief that he would not risk his squadron in a daylight action with the "Goeben," and had been told by the commander-in-chief that the circumstances would not arise. From the position signalled by the "Gloucester" he found he could not intercept them before daylight, and accordingly abandoned the pursuit and altered course for Zante at 3:50 A.M. Like the commander-in-chief, he saw no immediate danger in the "Goeben's" eastward course. Its vast consequences were beyond their ken. At 4 P.M. Aug. 7 the "Goeben" was off Cape Matapan with the gallant little "Gloucester" (Capt. William A. H. Kelly) still clinging doggedly behind. She had engaged the "Breslau" at 1:35 P.M., but had received orders not to follow beyond Cape Matapan and turned back at 4 P.M. The battle-cruisers were still at Malta, 400 m. behind. There the "Inflexible" and "Indefatigable" coaled and at 12:30 A.M. on the 8th, 12 hours after their arrival, left for the Aegean in chase. There was still time to do something, for difficulties had arisen as to entering Constantinople and the "Goeben" was cruising and coaling in the Aegean all the 8th and 9th. But again an unlucky mischance occurred. The Admiralty sent out a false alarm of war with Austria at noon on the 8th. The commander-in-chief received it at 1:30 P.M., when he was half-way between Malta and Greece, and decided to concentrate with Troubridge off the Adriatic. The telegram was cancelled a couple of hours later, but on being informed that the situation was critical he continued to close Troubridge. At noon on the 9th the "Inflexible" was 40 m. W. of Zante and it was not till 2:50 P.M. that the Admiralty ordered him to resume the chase.

He had lost 24 hours and did not enter the Aegean till 3 A.M. on Aug. 10. At 5:18 A.M. he passed Belo Pulo Light just as the "Goeben," 120 m. to the E., was finishing coaling off Denusa, a small island near Naxos. She had received orders by wireless to proceed to Constantinople and shaped course at 5:45 A.M. for the Dardanelles. It was too late to cut her off, nor had

the commander-in-chief information of her whereabouts. All that day he was searching for her in the Aegean. At 5 P.M. the "Goeben" was off Cape Helles, and at 16 minutes past 5 entered the Dardanelles, starting a train of events which exercised a momentous influence on the war. Adml. Milne received the news at noon on Aug. 11 and was ordered to watch the exit. At the beginning of the chapter of accidents lay the unhappy telegram ordering him to protect French transports which did not need protection. (A. C. D.)

**GOETHALS, GEORGE WASHINGTON** (1858– ), American army engineer, was born in Brooklyn, N.Y., June 29 1858. He entered the College of the City of New York in 1876, but at the end of three years went to West Point, where he graduated in 1880, receiving a commission as second lieutenant of engineers. In 1882 he became first lieutenant and was stationed at Cincinnati, where he was engaged in improving the channel of the Ohio river. Later he taught engineering at West Point for several years, but returned to Cincinnati in 1889. Afterwards he was in charge of the construction of the Muscle Shoals Canal on the Tennessee river and of another canal near Chattanooga, Tenn. In 1891 he was made captain. On the outbreak of the Spanish-American War in 1898 he was commissioned lieutenant-colonel of volunteers and appointed chief engineer of the First Army Corps. In 1900 he was commissioned major in the regular army and three years later was engaged in planning fortifications in the neighbourhood of Newport, R.I. He was then made a member of the General Staff in Washington, and in 1905 graduated from the Army War College. In 1907 he was appointed by President Roosevelt a member of the Isthmian Canal Commission, with the rank of lieutenant-colonel, and soon afterwards was made its chairman and chief engineer. Two years later he was promoted colonel. His arrival in Panama marked a new era in the construction of the canal. Hitherto the work had been in charge of high-salaried civilian engineers who dwelt at a distance. The work, as reorganized, was directed by army engineers subject to the control of the President of the United States. Several changes of plan, such as widening the canal, were now inaugurated. Col. Goethals favoured the lock form of canal, chosen by Congress in 1906, instead of the sea-level type. There was considerable opposition to his view but a special commission after inspection gave him support. He took up his abode on the spot, came into close contact with the labourers, won their admiration and confidence, and after seven years' labour brought his task to a successful issue. On May 15 1914 the canal was officially opened to barges, and on Aug. 15 following was declared open to world commerce. Col. Goethals was appointed the first civil governor of the Canal Zone by President Wilson in 1914 and the following year was made major-general. He favoured complete sovereignty of the United States over the Canal Zone. He resigned the governorship in 1916 and was appointed chairman of the board constituted to report on the Adamson Eight-Hour law. In 1917 he was appointed state engineer of New Jersey, but after America's entrance into the World War he was released to serve as manager of the Emergency Fleet Corporation. He had little faith in the plan for a wooden fleet and after three months resigned. Toward the close of 1917 he was appointed acting quartermaster-general, U.S. Army, and his "especially meritorious and conspicuous service" brought him the D.S.M. the following year. In 1918 he was appointed chief of the division of purchase, storage and traffic, and he was also a member of the War Industries Board. At his request he was relieved from active service in March 1919. He subsequently became the head of a business organization engaged in engineering and construction work.

**GOKHALE, GOPAL KRISHNA** (1866–1915), Indian constitutional leader, was born at Kolhapur in 1866 of a humble Chitpavan Brahman family. Graduating in arts at the Elphinstone College, Bombay, in 1884, he joined as professor of history and political economy the group of teachers at the Fergusson College, Poona, pledged to serve for 20 years on a merely nominal salary. He remained on the staff, finally as principal, until 1902. Becoming actively identified with the National Congress movement, he was for some years the joint secretary and in 1905 president at the Benares session. After two years on the Bombay Legislature, he was elected in 1902 to represent the non-official members thereof in the Viceregal Legislature. His persuasive eloquence, close reasoning, accurate knowledge of the subjects discussed, and instincts of statesmanship won him the Indian leadership, and Lord Curzon recognized his earnest patriotism by nominating him for the C.I.E. (1904). A few months before his death he declined promotion to knighthood of the order. Consulting him freely in reference to his projected constitutional reforms, Lord Morley wrote of him to the Viceroy as appreciating executive responsibility and having an eye for the tactics of common sense (*Recollections*, vol. ii., p. 181). He was fiercely assailed by the extremist section, which never succeeded in his lifetime in capturing the Congress machinery. In 1905 he founded his Servants of India Society, whose members take vows of poverty and lifelong service of their country in a religious spirit. Under the leadership of his successor, Mr. Srinivasa Sastri, the society is exerting a powerful influence in social and economic amelioration. In the enlarged Viceregal Legislature elected in 1910 Gokhale promoted measures for compulsory education on a basis of local option, but did not survive to see this principle introduced from 1918 onwards in most of the provinces. Though his last years were clouded by illness, he was a powerful member of the Indian Public Services Commission 1912–5. His death at Poona Feb. 19 1915 was a severe blow to the constitutional party at a critical moment in India's political history. His last political testament, entrusted on his deathbed to the Aga Khan, was published in Aug. 1917 and outlined plans of reform based on the principle of provincial autonomy, so substantially recognized in the Government of India Act 1919.

Gokhale's speeches down to 1908 were published in Madras and there are many small memoirs, but no authoritative life has been written. (F. H. Br.)

**GOLD** (*see* 12.192).—The world's production of gold increased rapidly as a result of the Californian and Australian discoveries of 1848 and 1851 from the £5,000,000 or £6,000,000 per annum of 1845–7 to £30,700,000 in 1853, and as these fields showed the decline natural to alluvial gold, the total dropped until it reached £19,600,000 in 1883. From then, and largely as a result of the discovery of the Witwatersrand district of the Transvaal, the output advanced almost annually (except for the Boer War period, 1899–1902) to £96,400,000 in 1915. Subsequently there was a marked decline.

TABLE I.—*Gold Production 1909–20 (in fine oz.).*
(Estimates of the Bureau of the U.S. Mint.)

| Year | Africa | Australasia | Canada | India | United States | World |
|---|---|---|---|---|---|---|
| 1909 | 8,271,575 | 3,435,007 | 453,865 | 501,097 | 4,821,701 | 21,965,111 |
| 1910 | 8,474,809 | 3,167,140 | 493,707 | 518,502 | 4,657,017 | 22,022,180 |
| 1911 | 9,265,672 | 2,911,410 | 472,241 | 534,744 | 4,687,053 | 22,348,313 |
| 1912 | 10,248,276 | 2,636,894 | 611,885 | 534,822 | 4,520,719 | 22,549,335 |
| 1913 | 10,024,816 | 2,569,311 | 802,973 | 589,109 | 4,299,784 | 22,249,596 |
| 1914 | 9,771,597 | 2,301,162 | 773,178 | 550,432 | 4,572,976 | 21,240,416 |
| 1915 | 10,538,588 | 2,369,800 | 918,056 | 557,399 | 4,887,604 | 22,674,568 |
| 1916 | 10,785,153 | 1,958,017 | 930,495 | 542,115 | 4,479,051 | 21,970,788 |
| 1917 | 10,366,972 | 1,664,011 | 738,831 | 523,069 | 4,051,440 | 20,289,546 |
| 1918 | 9,532,243 | 1,490,554 | 699,681 | 485,236 | 3,320,784 | 18,556,520 |
| 1919 | 9,374,140 | 1,263,177 | 767,167 | 507,260 | 2,918,628 | 17,664,910 |

From Table I it will be seen that Africa and Canada reached their highest in 1916, the United States in 1915, and India in 1913, while Australasia steadily declined during the entire period.

In the period 1848–75 nine-tenths of the output was won from alluvial and one-tenth from quartz reefs or lodes, but by the end of that period the proportion had already changed to two-thirds and one-third. Taking the 1919 output of £75,000,000, about £10,000,000, or 13 %, was obtained from alluvial; about £30,000,000, or 40 %, from lodes; and about £35,000,000, or 47 %, from the quartz conglomerate called "banket," found as a gold producer almost exclusively in the Witwatersrand district. In totals per annum the production from alluvial is about one-third of what it was at its best, and the production from lodes about two-thirds, while the banket output is still only one-eighth below its highest.

The decline in later years was almost general, every producing country of any importance showing a set-back. By reason of its greater steadiness of output the Transvaal, which had 40% of the 1915 world's output to its credit, claimed 49% of the 1920 total, while the British Empire in the same period advanced from 63% to 69%, and foreign countries dropped from 37% to 31%. This is shown by Table II.

TABLE II.—*The Decline in Gold Production after 1915.*
*(In millions of pounds at 84s. 11½d. per fine oz.)*

| Year | Transvaal | The rest of the Empire | British Empire | Foreign Countries | World | Drop as compared with 1915 | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | Transvaal | British Empire | World |
| 1915 | 38·7 | 22·0 | 60·7 | 35·7 | 96·4 | — | — | — |
| 1916 | 39·5 | 20·1 | 59·6 | 33·9 | 93·5 | — | 2 % | 3 % |
| 1917 | 38·3 | 17·8 | 56·1 | 30·2 | 86·3 | 1 % | 7½ % | 10½ % |
| 1918 | 35·8 | 15·2 | 51·0 | 28·0 | 79·0 | 7½ % | 16 % | 18 % |
| 1919 | 35·4 | 14·6 | 50·0 | 25·0 | 75·0 | 8½ % | 17½ % | 22 % |
| 1920 | 34·6 | 13·4 | 48·0 | 22·0 | 70·0 | 10½ % | 21 % | 27½ % |
| 6 yrs. | 222·3 | 103·1 | 325·4 | 174·8 | 500·2 | | | |
| Proportions | 44 % | 21 % | 65 % | 35 % | 100 % | | | |

A decrease of 27½% in the world's production is a serious matter. Its cause is doubtless to be found mainly in the exhaustion of the mines, but it has also been materially contributed to by the exceptionally heavy working costs resulting from conditions produced by the World War. For a long time the gold mines did not, as did practically all other industries, obtain any relief from their increased expenses in a higher price for their product, but from 1919 such of the mines as are in the British Empire (*i.e.* the majority) benefited from the premium on gold, to which reference will be made later. As working costs might, after 1920, be expected to be appreciably ameliorated, the relief should find its effect in a recovery of production, though the output is hardly to be expected to recover to more than about £80,000,000 a year, assuming of course that there are no new discoveries of importance. There has been no such discovery since that of the Witwatersrand in 1886, and this was altogether exceptional by reason of the unique character of the deposits, their extent and their proximity to coal-fields. It is true that the Klondike-Yukon field dates from as recently as 1896, but like other alluvial finds (California in 1848, Victoria, Australia, in 1851, and British Columbia in 1858), it reached its zenith within five years of its discovery, and in its best year contributed only a few million pounds to the world's total.

The earth's surface is rapidly becoming better known, and the more it is overrun the less is it likely that any potential gold-field will be found. It is, moreover, to be noted that the recent rapid growth of the gold output was due not only to new finds but to improved metallurgy, especially the cyanide process of treating tailings, so that while not very long ago only some 60% of gold in the ore was recovered, the proportion has been raised to 90 or 95%.

It has already been pointed out that the Transvaal contributes almost half of the world's present output, and nearly the whole of that colony's production is derived from the banket formation of the Witwatersrand district from a stretch of ground some 55 m. long and usually hardly more than 2 m. wide.

If one splits up this 55 m. by separating off the eastern and more recently developed 10 m., one gets a division into Old and New Rand, one showing distinct signs of decline, while the other has for the present all the symptoms of healthy growth. Thus:—

TABLE III.—*Yield of Old and New Rand compared.*
*(In millions of pounds at 84s. 11½d. per fine oz.)*

| *Year* | *Old Rand* £ | *New Rand* £ | *Whole Rand* £ |
|---|---|---|---|
| Total to 1907 | 179,697,000 | 7,217,000 | 186,914,000 |
| 1908 | 26,992,000 | 1,818,000 | 28,810,000 |
| 1909 | 28,037,000 | 1,863,000 | 29,900,000 |
| 1910 | 28,552,000 | 2,152,000 | 30,704,000 |
| 1911 | 30,732,000 | 2,811,000 | 33,543,000 |
| 1912 | 32,664,000 | 4,519,000 | 37,183,000 |
| 1913 | 31,197,000 | 4,616,000 | 35,813,000 |
| 1914 | 28,670,000 | 5,454,000 | 34,124,000 |
| 1915 | 29,723,000 | 7,542,000 | 37,265,000 |
| 1916 | 29,529,000 | 8,579,000 | 38,108,000 |
| 1917 | 26,313,000 | 10,705,000 | 37,018,000 |
| 1918 | 23,288,000 | 11,535,000 | 34,823,000 |
| 1919 | 22,277,000 | 12,177,000 | 34,454,000 |
| 1920 | 21,072,000 | 12,696,000 | 33,768,000 |
| | 538,743,000 | 93,684,000 | 632,427,000 |

Thus the Old Rand's production has dropped 35½% since high-water mark was reached in 1912, while the New Rand has shown an increase every year to date. Moreover, the yield on Old Rand ore has declined from 31s. 9d. per ton in 1908 to 24s. 8d. at the normal price of gold in 1920, and the profit of 13s. 3d. per ton in 1908 would to-day be represented by a loss at that normal price. The New Rand on the contrary has improved its yield and maintained its profit per ton. The result is that the total working profit of the Old Rand, which was £11,224,000 in 1908, is now represented only by the gold premium, while the New Rand has advanced in the same period from £787,000 to nearly £5,000,000 per annum. The latter field, therefore, affords the one instance of real importance of a rapidly increasing output. Incidentally one sees in the above table the result of the efforts put forth to increase the output in the earlier part of the World War, especially noticeable in 1915 and 1916. The fact that so many mines are now being kept going by the gold premium indicates that their production is likely to be severely diminished when the premium disappears. The New Rand is not likely to reach its zenith until about 1930, but the Witwatersrand district as a whole on the present outlook will show a continuance of the fall experienced since 1916, though its life, on a constantly diminishing output, is not likely to end until after 1960.

*Gold and Currency.*—While the producers of other commodities were able to secure higher prices for their products as the World War went on, and so were able to counteract the rise in working costs, gold-mining companies were not in that happy position. In the Rand district the annual average costs were 17s. 6d., 17s. 10d., 18s. 7d., 19s. 8d., 21s. 11d., 23s. 1d. and 25s. 7d. per ton for the years 1914 to 1920, and the normal value of the gold won was but 26s. 6d., 26s. 3d., 26s. 9d., 27s. 2d., 27s. 11d., 28s. 7d. and 28s. for the same years, so that the margin of profit on that normal value was reduced every year from 9s. per ton in 1914 to 2s. 5d. in 1920. Throughout the war the mines had only one outlet for their gold owing to the system of prohibitions of import and export, the Bank of England taking it at the normal price of 77s. 9d. per standard ounce. This arrangement was satisfactory so long as costs were not materially higher and so long as the currency received was felt to be worth par. But when it became clear that payment was being made in terms of depreciated paper, and that the Imperial Government was benefiting by selling the production abroad free of depreciation, the mining companies became restive. In their report of Aug. 15 1918, Lord Cunliffe's Committee on Currency and Foreign Exchanges after the war (*see* Cd., 9182) had recognized the position, though British currency was not then openly quoted at a discount:—

"It is not possible to judge to what extent legal tender currency may in fact be depreciated in terms of bullion. But it is practically certain that there has been some depreciation, and to this extent therefore the gold standard has ceased to be effective."

In July 1918, a committee representing the gold producers of the British Empire approached the British Government and pointed out the rise in working costs, the decrease in output and the fact that the gold was paid for in depreciated currency, and they suggested a special grant in some form during the abnormal times to meet the abnormal conditions. The Gold Production Committee (chairman, Lord Inchcape) was appointed by the Government, reported on Nov. 29 1918, and flatly refused the proposal:—

"To give more for an ounce of gold than it is worth in currency appears to us out of the question. . . . We are not prepared to recommend any bounty or subsidy for the purpose of stimulating the gold output of the Empire; gold being the standard of value no more can properly be paid for it than its value in currency."

Thus the Committee, three of whose four members had joined in the Currency Committee's report of three months before, completely ignored the undoubted depreciation in the currency and refused to give the mines the premium in paper which that condition of things justified. The gold producers, however, did not abandon their attitude, and the real depreciation of the currency became apparent when the N.Y. exchange, which had been artificially maintained at $4.76½ to the £ throughout the war, was "unpegged" in March 1919, and by the end of July had dropped to $4.35. The first to benefit were the Australian mines, the Australian Government agreeing to remove the embargo on the export of gold for a trial period of three months from Feb. 1919, a period which was subsequently extended from time to time. These mines, in the 16 months to June 1920, produced 1,314,000 fine oz. and sold 1,170,000 fine

oz., largely in Shanghai, Hong-Kong and New York, at a net premium of £1,388,319, or 23s. 8d. per oz. Therefore, they secured an average of 108s. 8d. per fine oz. for gold whose "value in currency" was but 85s. On July 24 1919, with the assent of the Imperial Government, the gold producers of the African colonies entered into an agreement with the Bank of England under which they agreed to send all their gold to the Bank of England on condition of their being then allowed to sell it in the open market and receiving a licence to reëxport it at any time within five weeks of its arrival at the Bank. Under this arrangement gold first arrived in Aug. 1919, after which time there was a market for gold in London, but merely for current production and not for stocks already there. From then to the end of the year the price varied from 96s. 8d. to 111s. 5d. per fine oz. and averaged 101s. 10d. as against the normal or Bank price of 84s. 10d., the average premium being 20%. In 1920 the price of gold varied between 127s. 4d. in Feb. and 102s. 10d. in June and averaged 112s. 6d., representing a premium of 32½%. The premium was hardly a premium at all. It merely meant that as long as the United States maintained an open mint, gold could be handed to that mint at the normal price of $20.66 per fine oz., and the resulting dollars could then be realized in London at a price based on the rate of exchange. The gold in fact was sold at gold par, but the resulting British currency obtained for it represented a premium in paper, simply because that paper was depreciated. A recovery of the N.Y. exchange to par would mean the reduction of the London price for gold to the normal 84s. 10d. per fine oz.

The gold of South Africa, Rhodesia and West Africa was sold under this arrangement to buyers all over the world, and at first the East was a heavy purchaser, but whether there was a demand for it or not the mines had always the U.S. mint to fall back upon, and in practice such of the gold as was not bought by others was sent to that mint as a matter of course. And as a matter of course also, the price was always based upon and closely followed the N.Y. exchange, which if it were, for example, $4.00 instead of $4.87, meant a premium in London of 21½% or a price of 103s. per fine oz., and so on.

During the period Aug. 1919 to March 1921, 14,311,000 fine oz. reached London and were sold under the Bank of England agreement already mentioned. Of this 3,928,000 oz. were taken by India and 954,000 oz. by the Straits Settlements, the East thus accounting for 34·1%. South Africa took 1,021,000 oz., or 7·1%, affording the strange spectacle of the South African banks buying sovereigns in London at 25s. 9d. apiece in order to replace sovereigns handed over their counters in the colony at 20s. to be smuggled to the East. South America took 6·8%, other countries 1·6% and the jewellery trade 5·6%, leaving 44·8% to go to the N.Y. mint. In 1919 60% of the output of these mines went to the East and only 10% to New York, but in the six months to March 1921, only 2½% went to India and as much as 96½% to New York, reflecting the temporarily changed conditions of the world, India and the newer countries showing a strong reversal of trade. The gold taken by India was bought by the India Government up to June of 1920 (private importation of gold being prohibited except under licence until that time), and was resold by it at a considerable profit on the bazaars. The price it paid to the producers plus transport, etc., charges averaged about 110s. per oz. and the price of resale on the bazaars was probably between 135s. and 145s., a difference of about £6,000,000. After free importation of gold was permitted the bazaar price approximated to the world (*i.e.* New York) price.

This sale of gold at a considerable premium in currency brings to mind the parallel of 1813 during the Napoleonic wars, when gold commanded 120s. per oz. in paper.

The consumption of gold, or rather the destination of the output, is perhaps best shown in mass figures (Table IV.).

The figures of the last quinquennium were of course markedly affected by the World War. Prior to 1915 the industrial arts and India, with variations attuned to trade cycles, were rapidly increasing their demands, and as soon as normal conditions are restored they are likely to reassert themselves. The recent absorption of China is abnormal and may not persist in the near future, for it is to be expected that that country will, like the India of decades ago, first show a greater appetite for silver. The amount shown as available as money after the demands of these first claimants have been satisfied has been sufficiently large to permit of a marked increase in the world's stock per head, which before the war resulted in a considerable rise in the prices of commodities, but the table hardly reflects the recent considerable decrease in the gold production already referred to, and it is to be expected that in the future the balance available as money will shrink so as to maintain the per-head figure for some time in the near neighbourhood of the 258d. shown for 1919.

TABLE IV.—*Consumption of Gold 1895–1919 in Quinquennia.*
(*In millions of pounds at 84s. 11½d. per fine oz.*)

| | 1895–99 | 1900–4 | 1905–9 | 1910–4 | 1915–9 |
|---|---|---|---|---|---|
| Industrial consumption of Europe and America | 65 | 79 | 95 | 121 | 90 |
| India's absorption (years to March 31 following) | 24 | 32 | 50 | 96 | 51 |
| Egypt's absorption | 8 | 15 | 11 | 4 | −1 |
| China's absorption | 0 | 2 | 2 | 3 | 17 |
| | 97 | 128 | 158 | 224 | 157 |
| World's gold production | 253 | 306 | 431 | 470 | 430 |
| Available as money | 156 | 178 | 273 | 246 | 273 |
| Aggregate stock of gold money (excluding India, China and Egypt) at end of period | 958 | 1,136 | 1,409 | 1,655 | 1,927 |
| Aggregate stock of gold money per head of the world's population | 151d. | 172d. | 204d. | 229d. | 258d. |

As a result of the war gold has become largely demonetized partly by being collected by Governments and partly by being hoarded, and most countries have prohibited its export. The result has been that the new production available and a further part of the existing stock has flowed into the State Banks and Treasuries of the world. The following is an attempt to show the position:—

| | *Dec. 1913* £ | *June 1920* £ | *Change* £ |
|---|---|---|---|
| Held by the U.S. Treasury | 266,000,000 | 445,000,000 | 179,000,000 |
| Held by State Banks and other Treasuries | 749,000,000 | 1,075,000,000 | 326,000,000 |
| | 1,015,000,000 | 1,520,000,000 | 505,000,000 |
| In private banks, in circulation and hoarded | 572,000,000 | 420,000,000 | 152,000,000 |
| World's stock of gold money (excluding India, China and Egypt) | 1,587,000,000 | 1,940,000,000 | 353,000,000 |

Thus the United States had increased its proportion of the world's stock from 17% to 23% (and the whole of the United States from 24½% to 28¾%), and State Banks and other Treasuries from 47% to 55½%, while the remainder in private banks, in circulation and hoarded, had dropped from 36% to 21½%.

In the 10 years before the World War the net coinage of gold in Europe and America was about £677,000,000, or £68,000,000 per annum, and of this amount £171,000,000 was issued from the Royal Mint in London, £103,000,000 in Australia, £183,000,000 in the United States and £220,000,000 in other countries. The effect of the war was to reduce the total to probably under £15,000,000 per annum for 1916 to 1919, the United Kingdom and United States coinage tailing off to nil, and the total being mainly contributed to by Australia and Mexico. In the latter country, as a consequence of its disturbed conditions, the note issues were made inconvertible and gold and silver coins disappeared, in accordance with Gresham's law. In due course of time the notes became waste paper, and in 1919 gold and silver were again minted and declared the only legal currency, so that Mexico has returned to a metallic basis. This transition from hard money plus notes to inconvertible notes which rapidly became of little value, and then to hard money again, all took place within the few war years, and in it can be seen the probable programme (when they can afford it) of the more hardly hit Continental countries. In the United Kingdom the policy was to revert to an effective gold standard, and as a preliminary the Currency Committee's recommendation that £150,000,000 of gold should be concentrated in the central institution had already been carried

out by 1920. When gold remonetisation occurs there is likely to be a shortage of the metal, and its appearance in actual circulation may be long delayed. It will probably first be used, as far as money is concerned, for international transactions and as a cover for notes. (J. K.)

**GOLD COAST,** WEST AFRICA (*see* 12.203).—In spite of the fact that the Gold Coast forms a British Crown colony (to which Ashanti and the Northern Territories are the adjoining protectorate) it consists (1921) of an agglomeration of small self-contained and mutually independent native states, each of which is under the immediate management of its own tribal organization. This consists of a paramount chief, variously called *Omanehene* by the Akans and by the people who have come under the Akan influence, *Manchi* by the Gas and all kindred peoples, *Konor* by the Krobos and *Fia* by the Ewe-speaking folk in the neighbourhood of and beyond the Volta. These paramount chiefs are in each case chosen for the offices they fill by the tribesmen concerned, the candidates belonging to one or more families from among whose members alone a chief can be selected. The Akans trace descent exclusively through the female line and among them a chief can only be succeeded by the son of a female relative and never by one of his own sons. The non-Akan peoples of the Gold Coast recognize descent through the male line; but with Akans and non-Akans alike, men are selected to fill the office of chief, nominally by popular suffrage, in reality by the principal sub-chiefs, counsellors and elders of the tribe or section of the tribe concerned, care being taken to choose the most suitable of the eligible candidates. All chiefs are liable to "destoolment" at the decree of their people if they fail to give satisfaction. Every paramount chief is the occupant of a stool, which is reputed to be the seat of office of the original founder or leader of the tribe; and in this often fragmentary wooden relic the spirits of his ancestors are believed to abide, and to them, through it, sacrifices are offered, and libations of blood (formerly human, to-day that of fowls or goats) are poured over it on all ceremonial occasions. Each paramount chief is assisted in his office by a number of sub-chiefs of varying rank, whose jurisdiction, until quite recently, was personal rather than territorial. These sub-chiefs, with certain counsellors and elders of the tribe, jointly deliberate with the paramount chief upon all matters of importance. All evidence is given before them in public; but all in authority retire to consider their verdict, which is subsequently announced to the tribesmen by the Linguist, who is the mouthpiece of the paramount chief on all formal occasions. The bulk of the population, no matter what their age, are collectively classed as "young men" and, in spite of the democratic principles upon which the tribal organization is theoretically based, they ordinarily have very little voice in public affairs.

Until the spread of permanent, as opposed to shifting, cultivation was brought about by the extensive planting of cocoa, the territorial limits of the numerous tribal areas were very roughly defined, but as the value of land has appreciated, boundary questions have come into ever greater prominence and have given rise to interminable litigation, the cost of which has well-nigh ruined several of the tribes concerned. The judicial powers of the chiefs of all ranks are defined by the Native Jurisdiction Ordinance, appeals lying to the provincial and supreme courts, and ultimately to the Privy Council.

So far as it is possible to trace local history prior to the incursion of Europeans, it would appear that the Twi- or Tschi-speaking people, who to-day form the predominant native race, and to which the Akan tribes of the colony, and Fantis and the Ashantis alike belong, were expelled from the open country of the upper Volta valley by Arab or Fulani Mahommedan invaders, probably about the 10th or 11th century A.D., and were forced to seek a new home in the tsetse-fly infested forest country, whither their mounted assailants could not follow them. The country which is now Ashanti and the Gold Coast colony appears at that time to have been inhabited by a number of negro tribes possessing a culture far more primitive than that of the Twi-speaking folk, who it is probable were in some instances still in the neolithic stage. The newcomers rapidly overran the forest country, subdued or absorbed the autochthonous inhabitants, and established mutually independent tribal units alike on the coast and in the interior. It is probable that the original invasion of the forest area was undertaken almost simultaneously by a number of separate bands of fugitives; and that, as these communities successively outgrew the food-supply yielded by the lands which they had occupied, further emigrations took place, the section of a tribe separating itself from the rest sometimes electing to form a wholly distinct political unit, and sometimes continuing to recognize an actual allegiance to the tribal organization under which it had once lived, or at any rate a perpetual alliance with it. In many cases, no doubt, the aborigines were exterminated, but in others they survive to this day, the Efutu tribe in the central and the Gwangs and Cherepongs in the eastern province of the colony, for instance, still retaining their identity, their languages and some traces of a distinct tribal organization. In the western parts of the Gold Coast the aborigines appear to have come under Akan influence, but to have avoided actual conquest; while on the eastern side the Akan invaders came into contact with such people as the Gas, the Krobos and the Ewe-speaking people beyond the Volta, all of whom, it is probable, are descendants of invaders who pushed westward into these coastal districts from the neighbourhood of the Niger estuary. In quite recent times one Akan tribe, the Akwamus, established themselves in lands which they still occupy on both banks of the Volta, at a point some 60 m. from its mouth; but with this exception, the Akan or Twi-speaking peoples of Ashanti and the colony form a distinct ethnological wedge sandwiched between different stocks.

Sir William Brandford Griffith was British governor of the Gold Coast from 1886 to 1895, in which year he was succeeded by Sir William Maxwell, Colonial Secretary of the Straits Settlements, who first started the colony upon an upward grade. Under his administration some very important boundary disputes were settled with the French; Kumasi was occupied by an expeditionary force, which met with no resistance, and Prempeh, the Ashanti king, was deported, first to Sierra Leone and subsequently to the Seychelles. On Sir William Maxwell's premature death he was succeeded by Sir Frederick Hodgson, under whose administration a search for the "golden stool"—the throne of the Ashanti kings—caused an extensive rebellion in Ashanti, which led to the final conquest of the country. Sir Matthew Nathan succeeded to the governorship in 1900, and under his administration Sekondi was converted from an insignificant fishing village into an important seaport, and the railway from that place to Kumasi was constructed. In 1904 Sir John Rodger became governor and held the post till his death in 1910. During his term the waterworks both at Accra and Sekondi were inaugurated, though he did not live to see them completed. He was succeeded by Mr. Thorburn, the Colonial Secretary of Southern Nigeria, formerly a member of the Ceylon civil service, who in 1912 was followed by Sir Hugh Clifford, the Colonial Secretary of Ceylon. During his administration, which lasted till July 1919, the railway extension from Mangoase via Koforidua to Tafo was completed, and the whole line from that place to Kumasi was surveyed and demarcated. Numerous public works of importance were constructed, in spite of the World War, *e.g.* the up-to-date railway workshops at Sekondi, with the electrical installation which supplies lighting for the town; the Government offices, general post office and headquarters police barracks at Accra; a very large number of bungalows of modern type which, with the segregation areas in which they are situated, have revolutionized the living conditions of the official population in most of the principal centres alike in the colony and in Ashanti; and some 600 m. of motor-road. Sir Hugh Clifford was succeeded by Brig.-Gen. F. G. Guggisberg in Sept. 1919. By him extensive harbour works at Sekondi were projected and an extension of the railway from Tafo to Kumasi was being made in 1921.

On the outbreak of the World War the adjoining colony of Togoland was invaded by the Gold Coast Regt. under the command of Lt.-Col. Bryant. Lome, the capital, was abandoned without a struggle, the enemy retiring up the Lome–Atakpame railway in the direction of Kamina, the place in the interior where a gigantic wireless installation had been completed in the preceding July. On Aug. 28 the German force, after destroying the wireless installation, was compelled to surrender, their defeat being accomplished by the Gold Coast Regt., which had been joined a few days earlier by a platoon of French native troops. A larger French force arrived at Kamina a few days later. A provisional agreement for the immediate partition of Togoland between Great Britain and France was negotiated by Sir Hugh Clifford and by M. Nouffland, the lieutenant-governor of Dahomey, at Lome on Aug. 30, and was confirmed by their

respective Governments. Under it slightly more than half the geographical area of the country was placed under the French, the remainder—which however included Lome, the only port of entry and the terminus of the three railway lines—being administered on behalf of Great Britain by the Government of the Gold Coast, which bore all the charges connected with the conquest and the subsequent occupation of the country. The net revenue derived from customs and from the railway, though collected by the British, was divided equally between them and the French. Under British rule the western districts of Togoland prospered exceedingly, it being calculated that within two years the areas under cultivation exceeded by 33% those which had been tilled in German times. The work of administration was carried on by a handful of British officers, selected for that purpose from the Gold Coast, under Maj. Rew, the officer commanding in Togoland, who exercised both military and civil functions under the guidance of the governor of the Gold Coast. By an agreement concluded in Paris in July 1919, the greater part of the territory hitherto occupied by the British, including Lome, was surrendered to the French, only a few frontier districts remaining under the Gold Coast.

After its conquest of Togoland the Gold Coast Regt., leaving a small force to garrison the occupied territory, took part in the Cameroon campaign and did not return to Kumasi until May 1916. In the following July the bulk of the regiment embarked for East Africa, where it took a distinguished part in the campaign both in German and Portuguese territory, returning to the Gold Coast in Sept. 1918. During this time it was regularly supplied with drafts of men recruited in the Gold Coast and trained at depots established throughout its dependencies, including the occupied area in Togoland, and at the time of the Armistice the regiment had expanded into a brigade, commanded by Brig.-Gen. R. A. de B. Rose.

Since 1890 a great social and economic revolution, which even the war was powerless materially to affect, has been wrought in the Gold Coast, and latterly in Ashanti also, through the spread of cocoa-cultivation. In 1891 a parcel of cocoa weighing 80 lb. and valued at £4 was exported from the Gold Coast. In 1901 cocoa weighing 960 tons and valued at £42,827 was exported; and by 1911 the export had expanded to 35,261 tons, valued at £1,613,448. During the last year before the war 50,554 tons of cocoa were exported, equivalent at that time to about one-third of the total cocoa crop of the world. In spite of the war these figures during the succeeding years were not only maintained, but exceeded, the annual exports of cocoa from 1914 to 1919 being 52,888; 77,278; 72,161; 80,374; 66,343; and 176,176 tons. The decline in 1916 was due to the tightening of the blockade into Germany via Holland, and the recovery in the following year to the opening-up of direct trade with the United States. The serious falling-off in 1918 was due to the shortage of shipping, and a large part of the enormous exports in 1919 consisted of cocoa that should have been shipped during the preceding year. The exports for 1919 were valued at £6,481,569. The cocoa industry has throughout been entirely a native enterprise, Europeans acting only as carriers, purchasers and shippers; and the introduction of this permanent form of cultivation has created private property in real estate, which is not contemplated by local custom, under which all lands are communal. Apart from this, the spread of the cocoa industry has brought great wealth to the African population, which has been utilized by them to improve the character and material of their houses, their clothing, their diet—meat being now consumed in large quantities throughout the country—and generally to raise their standards of comfort. Their increased expenditure upon imported spirits was comparatively trifling; but under an international agreement the importation of such spirits was prohibited, with effect from Feb. 1919. Owing to the very high duties imposed upon these articles the revenue they yielded was large, and the sudden cessation of this source of income was making itself acutely felt in 1921, with the return of more normal trade. Cocoa cultivation, moreover, is such light toil that it disinclines the natives to work their palms or to undertake similar comparatively heavy tasks; and kola-nuts, of which more than 16 million tons were exported during 1919, are the only other export with a steady tendency to increase.

The revenue and expenditure of the Gold Coast and its dependencies and the value of the trade of the country for various periods are shown in the following table:—

| Year | Revenue | Expenditure | Imports | Exports |
|---|---|---|---|---|
| 1910 | £1,006,633 | £ 924,862 | £3,439,831 | £ 2,697,706 |
| 1913 | 1,301,566 | 1,230,850 | 4,952,494 | 5,427,106 |
| 1916 | 1,835,089 | 1,465,946 | 5,999,746 | 5,816,527 |
| 1919 | 2,601,359 | 1,781,179 | 7,946,981 | 10,814,175 |

Owing to the shortage of silver, notes having face values of £1, 10s., 2s. and 1s. were introduced in 1918, the shilling notes proving most unpopular among the natives. In 1920 silver coins of the same quality as the new issue in Great Britain were put into circulation, and later in the year token coins, resembling in every way the 3d., 6d. and 1s. pieces issued by the West African Currency Board, which was established in 1912–3, but minted from an alloy, were put upon the market. These were gradually replacing the paper money of low denomination, but were not regarded with much favour by the natives of the Gold Coast.

Claridge, *History of the Gold Coast and Ashanti* (1915); Sir Hugh Clifford, *The Gold Coast Regiment in the East African Campaign* (1920). (H. CL.)

**GOLDMARK, KARL** (1832–1915), Austrian composer (*see* 12.212), whose most successful opera, *Die Königin von Saba*, was produced by the Carl Rosa opera company in Manchester in 1910, died at Vienna Jan. 1 1915.

**GOLF:** *see* SPORTS AND GAMES.

**GOLLANCZ, SIR ISRAEL** (1863– ), British man of letters, of Jewish family, was born in London July 13 1863. He was educated at the City of London school and afterwards at University College, London, and Christ's College, Cambridge. From 1892 to 1895 he was Quain student and lecturer in English at University College, London, and in 1896 was appointed university lecturer in English at Cambridge, becoming in 1906 university professor of English language and literature at King's College, London. He became secretary of the British Academy on its foundation in 1903. He was general editor of the *Temple Classics* and *King's Library* series and of the *Book of Homage to Shakespeare* which appeared in 1916. His published works include *Cynewulf's Christ* (1892); an edition of Lamb's *Specimens of Elizabethan Dramatists* (1893); *Exeter Book of Anglo-Saxon Poetry* (1895) and *Hamlet in Iceland* (1898).

**GOLTZ, COLMAR,** BARON VON DER (1843–1916), Prussian general, military writer and organizer of the Turkish army (*see* 12.227). Gen. von der Goltz was made a field-marshal in 1911 and retired in 1913. In Aug. 1914 he was appointed governor-general of Belgium, then occupied by German forces. In Nov. of the same year he was attached to the Turkish headquarters as aide-de-camp-general to the Sultan. In April 1915 he was placed in the chief command of the I. Turkish army in Mesopotamia, and succeeded in investing Gen. Townshend's British forces at Kut-el-Amara on April 19 1916. He died at Bagdad and was said to have been poisoned by the Young Turks. His latest work was *Kriegsgeschichte Deutschlands im 19ten Jahrhundert* (1910–4, 2 vols.).

**GOLTZ, KARL,** COUNT VON DER (1864– ), German lieutenant-general, was born at Brühl June 28 1864. He commanded a division of the *Landwehr* at the battle of the Masurian Lakes in Feb. 1915. In the spring of 1918 he led the Baltic Div. (*Ostsee* Div.) into Finland and was appointed chief-in-command in the Baltic countries in Nov. 1918. In the following year his position became anomalous. He was leading a volunteer army professedly against the Bolshevists, but his recall was demanded by the Allied and Associated Powers. His removal was effected only with great difficulty by the Berlin Government, as he had taken the bit in his teeth. He was suspected of cherishing designs for leading his Baltic volunteers back at some suitable moment into Germany in order to place them as an instrument at the disposal of the royalist and reactionary movement. Sections of them (*Das Baltikum*) actually took part in the military occupation of Berlin which attended the Kapp *coup* in March 1920, and great difficulty was afterwards experienced in disbanding them. Count von der Goltz wrote *Meine Sendung in Finnland und im Baltikum* (1920), describing his experiences in the Baltic countries in 1918–9.

**GOLUCHOWSKI, AGENOR,** COUNT (1849–1921), Austrian statesman (*see* 12.227), died at Lemberg March 29 1921.

**GOMME, SIR GEORGE LAURENCE** (1853–1916), English archaeologist, was born in London Dec. 17 1853 and educated at the City of London school. As a boy he entered the service of the Metropolitan Board of Works; but in 1891 he was ap-

pointed statistical officer to the London County Council, becoming in 1900 clerk to the Council. He was founder of the Folklore Society and editor successively of the *Antiquary*, the *Archaeological Review* and the *Folklore Journal*, and few men have ever possessed a more profound knowledge of the past and present history of London (*see* 16.957). He married Alice Bertha Merck, authoress of *Traditional Games of Great Britain*. In 1911 he was knighted. He died at Long Crendon, Bucks, Feb. 25 1916.

Amongst his numerous publications were *Primitive Folk-Moots* (1880); *Folklore Relics of Early Village Life* (1883); *The Village Community* (1889); *Folklore as a Historical Science* (1908); etc.

**GOMPERS, SAMUEL** (1850– ), American labour leader (*see* 12.230), was convicted in 1907 and sentenced to 12 months imprisonment for contempt of court in disobeying an injunction restraining him from printing the name of the Buck Stove and Range Co. in the "black list" of *The Federationist* (the organ of the A. F. of L.). He appealed, and after seven years of litigation he won his case, the U.S. Supreme Court deciding in 1914 that action was barred by the statute of limitations. Although in theory opposed to all war, after the outbreak of the World War he resisted any tendency in labour unions to favour peace at any price, and declared himself in favour of voluntary military training. After America's entrance into the World War he was appointed a member of the Advisory Commission of the Council of National Defense in 1917; the same year he was elected president of the American Alliance of Labor and Democracy, which was organized, with the approval of President Wilson, for combating disloyal propaganda among workmen. He represented the A. F. of L. at the Peace Conference in Paris 1918–9, and was appointed chairman of the International Committee on Labour Legislation. He was also chairman of the American labour delegates at the convention of the International Federation of Trades Unions at Amsterdam in 1919. He consistently opposed socialistic movements among the unions and favoured collective bargaining. He opposed compulsory arbitration in labour disputes and urged that labour unions be exempt from the anti-trust law. He urged the ratification of the Peace Treaty. In 1921 he was elected president of the A. F. of L. for the fortieth time.

**GOMPERZ, THEODOR** (1832–1912), German scholar (*see* 12.230), died at Baden, near Vienna, Aug. 29 1912.

**GOODWIN, NAT(HANIEL) CARL** (1857–1919), American actor (*see* 12.239), died in New York Jan. 31 1919.

**GOODWIN, WILLIAM WATSON** (1831–1912), American scholar (*see* 12.240), died in Cambridge, Mass., June 16 1912.

**GORE, CHARLES** (1853– ), English divine (*see* 12.254), was in 1911 translated from the see of Birmingham to that of Oxford. In 1919 he resigned his bishopric and settled in London, where he continued to identify himself with those social and economic tendencies which are known as Christian Socialist. His recent works include *New Theology and Old Religion* (1908); *Orders and Unity* (1910); *The Question of Divorce* (1911) and *The Religion of the Church* (1916).

**GORELL, JOHN GORELL BARNES, 1ST BARON** (1848–1913), English judge, was born at Liverpool May 16 1848, the son of Henry Barnes, a shipowner. He was educated at Peterhouse, Cambridge, where he took his degree in 1868. He began work as a solicitor, but was called to the bar in 1876, becoming Q.C. in 1888. He was well known as an expert in Admiralty cases, and in 1892 was made a judge of the Probate, Divorce and Admiralty division, becoming its president in 1905 on the retirement of Sir Francis Jeune (Lord St. Helier). He was made a privy councillor in 1905, and in 1909 was raised to the peerage. In 1909 he became chairman of the royal commission on divorce. Lord Gorell, who married in 1881 Mary, daughter of Thomas Mitchell, died at Mentone April 22 1913.

He was succeeded by his son, HENRY GORELL BARNES (1882–1917), who was born Jan. 21 1882, and educated at Winchester, Trinity College, Oxford, and Harvard. He was called to the bar in 1906, and acted as secretary to his father during the latter's later years on the bench and also during his presidency of the divorce commission. He served during the World War and was awarded the D.S.O. He was killed in action Jan. 16 1917, and was succeeded as 3rd baron by his brother, the Hon. Ronald Gorell Barnes (b. 1884).

See J. E. G. de Montmorency, *John Gorell Barnes, first Lord Gorell* (1920).

**GORGAS, WILLIAM CRAWFORD** (1854–1920), American army surgeon, was born at Mobile, Ala., Oct. 3 1854. His father was brigadier-general and chief of ordnance in the Confederate army during the Civil War. He was educated at the university of the South, Sewanee, Tenn. (A.B. 1875), and Bellevue Hospital Medical College, New York (M.D. 1879). He was an interne at Bellevue hospital from 1878 to 1880 and in the latter year entered the Medical Corps of the U.S. army. In 1885 he became captain. During the Spanish-American War he served as major (Medical Corps), being sent, after the Santiago expedition, to Havana where he assumed care of yellow-fever patients. From 1898 to 1902, as chief sanitary officer he was in charge of the sanitation measures carried out in Havana. The city was thoroughly cleaned and many experiments were conducted in connexion with the recent discovery that yellow fever was transmitted by the mosquito. Because of his success in eliminating yellow fever at Havana he was made assistant surgeon-general, U.S. army, with the rank of colonel, by a special Act of Congress in 1903. In 1904 he was sent as chief sanitary officer to Panama, where two of the main obstacles to success in building the Canal were yellow fever and malaria. Here again his methods were so efficient that by the close of 1906 he had eliminated yellow fever from the Canal region. Malaria also was eventually brought under control and the Canal Zone converted into a healthful spot. In 1907 he was appointed a member of the Isthmian Canal Commission by President Roosevelt, and the following year was U.S. delegate to the first Pan-American Medical Congress, held at Santiago, Chile. He was president of the American Medical Association 1908–9. In 1913 he was called to the Rand Gold Mines in South Africa to suggest means for combating the frequent epidemics of pneumonia (influenza). This he found was largely due to crowding the labourers together in barracks, and he recommended that they be placed with their families in separate abodes. In 1914 he was made surgeon-general, U.S. army, with the rank of brigadier-general. The same year he was awarded the degree of D.Sc. by the university of Oxford and received the Seaman medal from the American Museum of Safety and a gold medal from the American Medical Association. In 1916 he was made major-general, U.S. army, and in 1918 was retired. He then assumed the permanent directorship of the yellow-fever work of the International Health Board of the Rockefeller Foundation. He went to Central America to make a survey, and under his direction investigation of yellow fever was made at Guayaquil, Ecuador, and in Guatemala. In 1919 he accepted a contract with the Government of Peru to carry out a sanitary programme in that country. He received many marks of recognition at home and abroad. He was awarded the D.S.M. (U.S.), and made Commander of the Legion of Honour (France) and K.C.M.G. (Great Britain). He died in London July 4 1920 and was buried in the Arlington National Cemetery in Washington, D.C.

**GÖRGEI, ARTHUR** (1818–1916), Hungarian soldier (*see* 12.256), died in May 1916.

**GORST, SIR JOHN ELDON** (1835–1916), British politician (*see* 12.261), died in London April 4 1916. His son, SIR J. ELDON GORST, died at Castle Combe, Wilts., July 12 1911.

**GOSSE, EDMUND** (1849– ), English man of letters (*see* 12.268), was the recipient Sept. 21 1919, his 70th birthday, of an address of congratulation signed by a large body of Englishmen of note in art or letters, in recognition of his long and distinguished service to literary criticism. This was followed up by the presentation to him on their behalf of a portrait bust, Nov. 9 1920. His more recent publications include *Portraits and Studies* (1912); *Collected Essays* (1912); *Inter Arma* (1916); *The Life of A. C. Swinburne* (1917); *Three French Moralists* (1918); *Some Diversions of a Man of Letters* (1919).

**GOUDY, HENRY** (1848–1922), English jurist, was born in the north of Ireland Sept. 16 1848, the son of the Rev. A. P. Goudy, D.D., of Strabane, co. Tyrone. He was educated at the universities of Glasgow, Edinburgh and Königsberg, obtaining thus special advantages for the study of Roman law, in which he became a leading authority. He was called to the Scottish bar and published a work on the Scottish law of bankruptcy in 1886. In 1889 he was appointed professor of civil law at Edinburgh University and in 1893 regius professor of civil law at Oxford which chair he occupied until 1919, being also fellow of All Soul's College in right of his professorship. He was joint author of a *Manual on Local Government in Scotland* (1880), edited Muirhead's *Private Law of Rome* (1898), translated and annotated Jhering's *Jurisprudenz des täglichen Lebens* (1904), and published a short treatise on *Trichotomy in Roman Law* (1910), as well as a lecture on the *Fate of the Roman Law north and south of the Tweed* (1894) and various articles for the *E.B.* He was editor of the *Juridical Review* from its foundation in 1889 until 1893, and he was one of the founders of the Society of Public Teachers of Law and of the Grotius Society, instituted in 1915 during the World War, for the advancement of international law. He died at Bath March 3 1921.

**GOUGH, SIR HUBERT DE LA POER** (1870– ), British general, was born on Aug. 12 1870, son of Gen. Sir C. Gough. He joined the 16th Lancers in 1889 and served in the Tirah campaign. In 1899 he was sent out to South Africa on special service, and he commanded a mounted infantry regiment with distinction for nearly two years, being promoted brevet lieutenant-colonel for his services. He held staff appointments after returning home. Promoted colonel in 1906, he in 1911 became brigadier-general commanding the 3rd Cavalry Brigade at the Curragh, where his attitude with regard to Ulster and the use of the troops in 1914 caused a grave political crisis (*see* ENGLISH HISTORY). He took his brigade to France in Aug. of that year, succeeded to the command of the 2nd Cavalry Div. in Sept., and was promoted major-general for distinguished service in Oct. He was in April 1915 transferred to the 7th Div., and was in July given charge of the 1st Army Corps, a position which he held until the spring of 1916, when he was given command, first of a reserve force, and afterwards of the newly constituted 5th Army; with this he played an important part in the battle of the Somme, and he was given the K.C.B. He was promoted lieutenant-general at the beginning of 1917 and in that year he was for some time in charge of the Flanders offensive. Then, early in 1918, it fell to the lot of his army to be on the right wing, next to the French, and to take over from them a considerable front on both sides of the Oise, for which his forces were inadequate. The brunt of the great German offensive of March fell in the first place on his troops, who were unable to withstand the pressure and fell back with heavy loss in personnel and material. Gough's dispositions under circumstances of the utmost difficulty were appropriate, and responsibility for the disaster did not rest with him; nevertheless he was deprived of his command by the Government and was ordered home. He was afterwards for some months head of the British Mission to the Baltic States in 1919, and he was in that year given the G.C.M.G. On his return, influenced no doubt by his experiences in the Baltic States, Gen. Gough came forward as a prominent advocate of a world-settlement based upon consent and goodwill, and especially as a supporter of such a settlement of the Irish question.

His younger brother, JOHN EDMUND GOUGH (1871–1915), who had joined the army in 1892, was also a distinguished soldier. He served in central Africa in 1896–7 and in the South African War, and in the Somali campaign of 1902–3, where he won the V.C. and was promoted brevet lieutenant-colonel. He reached the rank of colonel in 1906 and commanded the troops in Somaliland from 1908 to 1910. He afterwards held appointments on the staff and he went out to France in 1914 as brigadier-general, general staff, of the 1st Army Corps. When the expeditionary force was divided into two armies, he became head of the general staff of the 1st Army, but shortly afterwards he was severely wounded, and on Feb. 21 1915 he died of his wounds. He was the author of a study of the Fredericksburg and Chancellorsville campaigns (1913) and of several remarkable essays on military subjects.

**GOUIN, SIR LOMER** (1861– ), Canadian statesman, was born at Grondines, Quebec, in 1861 and was educated at Laval and McGill Universities. He was called to the Canadian bar in 1884, and became Q.C. in 1900, being elected Bâtonnier-General of the Quebec bar in 1910. He was a member of the Quebec Legislature from 1897; and, after holding minor offices, in 1905–20 was Prime Minister and Attorney-General in the province of Quebec. Attempts were made by Sir Robert Borden to get him to join his Coalition Ministry, but these failed, and subsequently Sir Lomer declared his allegiance to the Liberal Opposition. He derived considerable importance from the fact that he was the Quebec representative on the boards of large Canadian financial institutions. He was knighted in 1908, and received the K.C.M.G. in 1913. His first wife (d. 1904) was a daughter of Honoré Mercier, a former Premier of Quebec. On the Liberal victory in Dec. 1921 he was included in the new Cabinet of Mr. Mackenzie King.

**GOURAUD, HENRI JOSEPH EUGÈNE** (1867– ), French general, was born at Paris on Nov. 17 1867. He entered St. Cyr in 1888, and was commissioned to the infantry in 1890. Two years later he was promoted lieutenant. In 1894 he was seconded for duty under the colonial administration; and thereafter he gained much experience of active service in the French Sudan, in which he served almost continuously for two years. In 1904 he was promoted lieutenant-colonel and made commandant of the Chari (Congo) territory. In the same year he was made an Officer of the Legion of Honour—he had already won the cross of Chevalier for distinguished service. In 1907 he was promoted colonel. He next served in Morocco, where he remained until the outbreak of the World War. On Sept. 17 1914 he was promoted temporary general of division, and the following Jan. was appointed commander of the Colonial Army Corps. On Feb. 15 1915 he was made a substantive general of division. In May he replaced D'Amade as commander of the Corps Expéditionnaire d'Orient in the Gallipoli theatre, where he was so badly wounded that his right arm had to be amputated. He was awarded the médaille militaire on July 10 1915. On recovering from his wound he went to Italy in charge of a mission, and then in Dec. 1915 he was appointed to command the IV. Army. A year later he was sent temporarily, as commissioner-general, to Morocco; but he again took command of the IV. Army in June 1917. From 1915 to the summer of 1918 the part of the IV. Army was relatively quiet, save for one moment in the spring of 1917 in which it was drawn into the ambit of Nivelle's offensive on the Aisne. At that time Gouraud was in Morocco. Thus, when on July 15 1918 the Germans launched their last offensive on the Champagne front, Gouraud had had little executive experience as an army commander in battle, and before the "zero" day Pétain had had some difficulty in convincing him of the necessity of a "coil spring" defence. But when the time came Gouraud carried out its principles admirably, and brought the Germans' last effort to a standstill in his battle-zone. The counter-attacks far to the west followed three days later, and the tide was turned for good. In turn the IV. Army, acting in conjunction with the Americans between Meuse and Argonne, assumed the offensive in Sept., and by Nov. 11 it had reached the Meuse between Sedan and Mézières. Gouraud was awarded the Grand Cross of the Legion of Honour on Dec. 28 1918. In Oct. 1919 he became high commissioner in Syria and commander-in-chief in the Levant.

**GOW, ANDREW CARRICK** (1848–1920), British painter, was born in London June 15 1848. He studied at Heatherley's art school, London, and first exhibited at the Royal Academy in 1869, a picture of his henceforward appearing there every year till his death. He was elected A.R.A. in 1881, and R.A. ten years later. In 1911 he became keeper of the Royal Academy. He died at Burlington House, London, Feb. 1 1920. Gow was best known as a historical painter. His works include "The

Relief of Leyden" (1876); "The Last Days of Edward VI." (1880); "Cromwell at Dunbar" (1886, bought by the Chantrey Fund); "Queen Mary's Farewell to Scotland" (1892) and "The Queen's Diamond Jubilee at St. Paul's" (1897, painted for the Corporation).

**GRACE, WILLIAM GILBERT** (1848–1915), English cricketer (*see* 12.308), died at Eltham, Kent, Oct. 23 1915. His elder brother EDWARD MILLS GRACE (1841–1911), who was born Nov. 28 1841, died at Thornbury, Glos., May 28 1911.

See Lord Hawke and others, *The Memorial Biography of Dr. W. G. Grace* (1919); *W. G. Grace, Cricketer* (1916); and F. S. A. Cooper, *Edward Mills Grace, Cricketer* (1916).

**GRAF, ARTURO** (1848–1913), Italian poet and critic (*see* 12.315), published in 1911 *L'Anglomania e l'influsso inglese in Italia nel secolo XVIII.* He died at Turin May 29 1913. *Poesie*, a collection of his best poems, appeared in 1915.

See Sartori Treves, *Arturo Graf, romanziere e poeta* (1904).

**GRANTHAM, SIR WILLIAM** (1835–1911), English judge, was born at Lewes Oct. 23 1835. He came of an old Sussex family, and inherited property in the county. After a successful career at the bar and in Parliament, where he represented East Surrey in the Conservative interest from 1874–85, he was appointed in 1885 judge of the Queen's Bench division of the High Court. He was never at pains to conceal his own views on politics, and after 1906, when he was on the rota of judges for election petitions, his decisions were sharply criticized as biassed against the Liberal party, notably in the Great Yarmouth case, which led to a motion of censure in the House of Commons in July 1906. But in certain criminal cases he gained considerable credit, and in the Adolf Beck trial he was one of the first to suspect the mistake as to the prisoner's identity (*see* 14.287). He was chairman of the East Sussex quarter sessions, and as a landlord took a practical interest in the housing of the rural labourers. He died in London Nov. 30 1911.

**GRANVILLE-BARKER, HARLEY** (1877– ), English playwright, producer and actor-manager, son of Albert James Barker, of Hereford, and Mary E. Bozzi-Granville, was born in London Nov. 25 1877. Educated privately, at the age of 13 he was sent to the Theatre Royal, Margate, then a stock company's theatre and a dramatic school. A year later he made his first stage appearance at Harrogate in Wilks's *Ben the Bos'un*, and he first appeared in London at the Comedy theatre the following year in *The Poet and the Puppets*. After playing in a diversity of dramas he became interested in the work of the Stage Society and especially in the plays of G. Bernard Shaw. In 1904 he joined J. E. Vedrenne in the management of the Court theatre, London, and there produced and acted in many of these plays, as well as in those of St. John Hankin, John Galsworthy, Ibsen, Masefield and his own play, *The Voysey Inheritance* (1905). His later play, *Waste*, forbidden public performance by the Censor, was played by the Stage Society in 1907, as was also *The Marrying of Ann Leete* (1901). *The Madras House* was produced by the Frohman repertory company at the Duke of York's theatre in 1910. In 1913–4 he produced Shakespearean dramas in an original manner at the Savoy theatre. He wrote *Souls on Fifth*, a fantastic story, and *The Red Cross in France*, both in 1916, published a volume of three short plays (1917), and a play, *The Harlequinade*, with D. C. Calthrop (1918). In 1921 he was appointed public lecturer on the art of the theatre by the university of Liverpool. He married first (1906) LILLAH MCCARTHY, herself a distinguished actress in Shaw's plays and in English versions of Greek drama. She made a special success as Ann Whitefield in Shaw's *Man and Superman* and Jennifer in his *The Doctor's Dilemma*. She was also Jocasta in Reinhardt's production of *Oedipus Rex* at Covent Garden in 1912, and Nan in Masefield's play of that name, as well as playing the name part in his translation of Jensen's *The Witch*, both first produced at the Court theatre in 1911 and repeated at the Savoy theatre in 1913. Miss McCarthy obtained a divorce in 1917, and in 1920 she married Prof. Frederick W. Keeble (b. 1870), of Oxford. Granville-Barker in 1918 married Helen Gates Huntingdon of New York.

**GREECE** (*see* 12.425).—Old Greece had up to 1912 an area of about 25,014 sq. miles. The Balkan wars of 1912–3 added to the kingdom New Greece, consisting of Macedonia, Epirus, Crete and a number of islands in the Aegean extending over 16,919 sq. m., making the area of the country 41,933 sq. m. in all, in 1914. After the World War, Greece, with the consent of the Allied and Associated Powers, occupied part of Western Thrace and of the vilayet of Aidin in Asia Minor and retained all the islands for the time being. According to the Treaty of Sèvres (Aug. 10 1920) Greece was to receive practically the whole of European Turkey W. of the Chatalja lines, and the Dodecanese islands were ceded by Italy when the treaty was signed. The war between Greece and Turkey left the situation as regards Asia Minor still uncertain during 1921.

The numerous changes make it impossible to present statistical returns in comparative form, but the available official figures are given in the tables. Table 1 shows the population at the dates given, for the departments as in 1914.

TABLE 1. POPULATION

| Department, 1914 | Area in sq. kms. | Census of 1907 or 1913 | Census of 1920 (uncorrected) |
|---|---|---|---|
| Attica and Boeotia | 5,997·6 | 407,063 (1907) | 581,829 |
| Salonika | 15,023·6 | 506,571 (1913) | 398,240 |
| Achaia and Elis | 5,507·1 | 254,728 (1907) | 271,672 |
| Larissa | 8,073·2 | 197,808 (1907) | 239,528 |
| Messenia | 3,267·9 | 218,514 (1907) | 226,066 |
| Florina | 3,310·8 | 142,336 (1913) | 200,866 |
| Aetolia-Acarnania | 7,671·6 | 188,597 (1907) | 195,571 |
| Trikkala | 5,823·9 | 183,489 (1907) | 186,476 |
| Kozani | 6,376 | 206,307 (1913) | 175,577 |
| Janina (Yannina) | 6,732·4 | 214,621 (1913) | 167,644 |
| Drama | 5,727·2 | 204,404 (1913) | 161,890 |
| Argolis and Corinthia | 5,221·8 | 153,172 (1907) | 158,528 |

Table 2 shows the annexed provinces, and the departments formed with population in 1920. It should be noted that in 1921 Thrace was being administered under a governor-general at Adrianople, and Ionia (subject to military operations in progress) under a high commissioner at Smyrna.

TABLE 2. NEW TERRITORY ACQUIRED AFTER THE WORLD WAR

| Province | Area in sq. kilometres | Department | Population 1920 |
|---|---|---|---|
| Thrace | 34,984 | Adrianople | 145,490 |
| | | Kirk-Kilisse | 134,359 |
| | | Gallipoli | 53,568 |
| | | Rodosto | 143,801 |
| | | Enos | 92,050 |
| | | Rhodope | 100,429 |
| Dodecanese (with Tenedos and Imbros) | 1,459 | | 121,800 |
| Northern Epirus | 4,921 | | 200,000 |
| Ionia | 17,500 | Aivali | 66,000 |
| | | Sanjak of Smyrna | 754,000 |
| | | Magnesia-(Manisa) | |
| | | Kassaba | 140,000 |

It will be seen that, altogether, the New Greece had an area

of 180,999.8 sq. km., and a pop. of 6,727,877. Table 3 shows the principal towns of Greece (including Thrace and Ionia).

TABLE 3. PRINCIPAL TOWNS

| | | | | | |
|---|---|---|---|---|---|
| Athens | (1920) | 300,462 | Trikkala | (1907) | 18,995 |
| Salonika | (1915) | 158,139 | Larissa | (1907) | 18,939 |
| Piraeus | (1920) | 130,082 | Mytilene | (1915) | 18,705 |
| Adrianople | (1911) | 65,454 | Kalamata | (1907) | 18,510 |
| Patras | (1920) | 46,500 | Chios | (1915) | 18,000 |
| Corfu | (1907) | 30,585 | Yannina | (1915) | 17,331 |
| Candia | (1915) | 25,185 | Zante | (1907) | 15,035 |
| Canea | (1915) | 24,399 | *Ionia:*— | | |
| Volo | (1907) | 23,563 | Smyrna | (1915) | 225,000 |
| Kavalla | (1915) | 23,378 | Manisa | (1915) | 35,000 |
| Syra | (1907) | 21,342 | Aivali | (1915) | 25,000 |
| Serres | (1915) | 19,468 | Kassaba | (1915) | 23,000 |

In 1921 there were 219,000 Greeks in the island of Cyprus; and it was estimated that there were about 800,000 in Asia Minor outside Ionia (Pontus and Anatolia), 225,000 in other Balkan states, 150,000 in southern Russia, and 100,000 in Egypt; besides the Greek colonists, many of them naturalized in foreign countries, who were estimated to amount to 20,000 in western Europe, 6,000 in India, Africa, etc., and 250,000 in the United States of America.

Emigration to the United States continued unabated after 1910. In 1914 45,881 emigrants from Greece entered the United States, and from 1915–20 the annual average was 26,500, or nearly 45,000, if all emigrants of Greek origin (from Egypt, Turkey and the Caucasus) are included. Between 1910 and 1920 the number of repatriated emigrants was about 6,000 a year. The number of Greek emigrants permanently established in N. America is said to approximate 500,000. Their remittances home were said in 1917 to amount to nearly £2,000,000 annually.

*Finance.*—Between 1898 and the end of 1913 new loans raised the Public Debt to 1,216,480,000 drachmae. In every succeeding year this was further increased, and on May 1 1921, the total Public Debt amounted to 6,208,264,000 drachmae. This vast growth was due to the successive deficits in the budget since the Balkan wars (which cost approximately 682,523,000 drachmae); to the preparations for entering the World War (1914–6), 570,000,000; to the war itself (war expenses Oct. 1916–Dec. 1918, 760,000,000, not including the value of war material supplied by the Allies); finally and especially to the war in Asia Minor, which up to Aug. 1921 must already have cost nearly 3,000,000,000 drachmae. Table 4 shows the revenue and expenditure 1910–20, deficits being due almost entirely to extraordinary war expenditure.

TABLE 4. REVENUE AND EXPENDITURE

| | Revenue | Expenditure |
|---|---|---|
| | Drachmae | Drachmae |
| 1910 | 129,500,000 | 140,500,000 |
| 1911 | 137,800,000 | 175,700,000 |
| 1912 | 127,200,000 | 207,900,000 |
| 1913 | 122,200,000 | 423,800,000 |
| 1914 | 221,000,000 | 555,000,000 |
| 1915 | 232,000,000 | 477,000,000 |
| 1916 | 230,000,000 | 363,000,000 |
| 1917 | 263,000,000 | 440,000,000 |
| 1918 | 288,000,000 | 824,000,000 |
| 1919–20 (Budget) | 469,690,000 | 1,554,357,000 |
| 1920–1 (Budget) | 597,011,000 | 2,095,304,000 |

The bank-notes in circulation increased from 310,604,185 dr. in 1914 to 1,856,173,000 in Nov. 1920, and approximately to 2,500,000,000 in May 1921. Table 5 shows the yield of taxes in millions of drachmae.

TABLE 5. TAXATION RECEIPTS

| | 1911 | 1912 | 1916 | 1917 | 1918 |
|---|---|---|---|---|---|
| Direct | 23·5 | 24 | 50·4 | 49·9 | 50·8 |
| Indirect | 62 | 56 | 89·2 | 68·1 | 95·2 |
| Monopolies | 13·2 | 13 | 18·4 | 18·4 | 20·9 |

The deposits in the banks of the country, on Sept. 10 1918, were 1,162,312,912 dr., of which 607,845,414 were at the National Bank of Greece and 184,445,821 at the Ionian Bank.

*Trade.*—Table 6 shows (in francs) the value of imports and exports, 1914–20.

TABLE 6. IMPORTS AND EXPORTS

| | Imports | Exports | Total |
|---|---|---|---|
| 1914 | 318,846,472 | 178,564,362 | 497,410,834 |
| 1915 | 289,390,294 | 218,356,354 | 507,746,648 |
| 1916 | 399,438,840 | 154,841,815 | 554,280,655 |
| 1917 | 223,075,496 | 112,626,577 | 335,702,073 |
| 1918 | 733,907,099 | 296,860,251 | 1,030,767,350 |
| 1919 | 1,608,323,928 | 726,533,168 | 2,334,857,096 |
| 1920 | 2,131,038,321 | 664,112,647 | 2,795,150,968 |

*Shipping.*—The merchant shipping of Greece in 1920 comprised a tonnage of 298,903, with 228 steamers and 1,048 sailing vessels. Of these, three were transatlantic liners of a total tonnage of 11,085 tons, and 23 others, between 2,000 and 5,000 tons, of a total tonnage of 59,282 tons. To this list should be added 54 steamers and eight sailing vessels bought in 1919 but not yet registered, representing a tonnage of 68,572 and 1,947 respectively. Greek river boats and tugs in foreign waters raised the total of the Greek merchant navy in 1920 to 1,697 vessels of 464,635 tons. These figures do not include about 10,000 vessels of less than 30 tons, registering altogether about 83,000 tons. The Greek merchant fleet suffered very severely during the war. Greece lost 299 ships of 718,000 tons, thus losing 64·6% of her pre-war tonnage.

*Communications.*—The total length of Greek railways in 1919 was 2,307·5 km., including the important section 88 km. in length from Papoula to Platy, by which the line from Piraeus to Demerli (the Greco-Turkish frontier of 1912) was joined up to the line from Belgrade to Salonika, thus putting Athens in direct railway connexion with W. Europe; this line was completed in 1916. To this total must be added a further section, nearly 700 km. in length, of the line from Salonika to Constantinople. The section from Salonika to the Greco-Bulgarian frontier of 1913, 340 km. in length, was acquired by convention of March 16 1919; the new section extends from the Greco-Bulgarian frontier of 1913 to the new Greco-Turkish frontier defined by the Treaty of Sèvres.

The construction of various new lines of about 970 km. (103 km. in old Greece, 863 in Epirus, Crete, etc.) was in 1921 under consideration; and the concession for a new line from Kavalla to Drama had already been obtained by a French company.

There are in Old Greece 3,286 km. of main roads, constructed before 1892, and 2,300 km. constructed between 1892 and 1920. In Crete, Macedonia and Epirus there are 2,538 km. New roads of 3,775 km. in length were projected, and about 600 km. were actually under construction in Nov. 1920.

Though commercial aviation had not yet been established in Greece in 1921, it should be noted that Athens is the natural centre of Mediterranean communications, and is situated at an almost exactly equal distance from Corfu, from the Greco-Serbian frontier, from Kavalla, from Gallipoli, from the Greco-Turkish frontier east of Smyrna and from the eastern shores of Crete.

*Agriculture.*—In 1918 the area under cultivation (within the frontiers of 1914) was given as 1,415,633 hectares, and produced 18,927,226 metric quintals (of 100 kg.) of various crops, of a total value of 1,591,526,024 drachmae. In 1920 the annual production, in quintals of the chief crops, was given as follows:—wheat 3,318,709, maize 2,320,723, must 1,816,793, barley 1,529,651, olive oil 1,410,918, currants 995,500, oats 579,953, rye 333,914, tobacco 310,864.

The progress of agriculture has been delayed by the small size of the holdings in most parts of the country; but this obstacle has been to some extent overcome by the law of 1915 on agricultural coöperative associations. In 1918 there were already 730 of these associations in existence with a membership of 27,051; more than half of these were loan associations to which the National Bank was authorized to advance up to 25,000,000 drachmae. Greece however still depends on foreign imports for her cereals. The average annual consumption per head is 180 okes (one oke = 2·832 lb. avoir.) while the average home production is 126 okes. The annexation of Thrace and (provisionally) of Ionia should remedy this defect. Meanwhile in other parts of the country, where estates are too large, as in Thessaly, and the *métayer* system prevails (the cultivator paying to the proprietor one-third or one-half of the gross produce), these estates are being broken up by the application of Law 1,072 on expropriation drafted by M. Michalakopoulos, in the Government of Venizelos. An agricultural bank to cover Crete, Macedonia and the islands, was being established in 1921, and agricultural instruction seriously organized. The agricultural population of Old Greece (1911) constituted 61% of the total population, and it is estimated that this proportion was raised to 65% by the annexation of Macedonia. The use of chemical manures is rapidly growing; in 1910 only 611,780 kg. were used, while the figure had risen in 1914 to 6,592,785 kilogrammes.

*Forests.*—The area under forests in 1914 was 1,600,000 hectares, half in Old Greece and the rest in the provinces acquired in 1913. They were valued at 320,000,000 drachmae, and the gross revenue estimated at 38,000,000 (19,300,000 in Old Greece).

*Fisheries.*—The annual produce of Greek fisheries was estimated in 1920 at 28,700,000 okes, of which 23,700,000 were the produce of State waters. In 1918 the yield was valued at 1,544,120 drachmae. In Sept. 1919 there were 1,941 fishing vessels registered at 84 ports, with total crews of 7,689 men.

*Manufactures.*—In 1920 there were 2,211 factories employing 36,124 workpeople, with plants valued at 260,518,437 dr. and an output at 871,494,508 drachmae. Of these 2,211 factories, 1,870 used power (40,000 H.P. in all), 570 steam, 283 oil, 383 electricity, 308 gas and 326 water-power. Water-power is used in flour-mills and macaroni factories (1,662 H.P.), oil refineries (202 H.P.), chemical industries (1,095 H.P.), textile industries (3,288 H.P.), tanneries (10 H.P.) and wood-work (15 H.P.). The development of water-power, in which Macedonia is remarkably rich, is expected to be of great importance in the future. The lake of Ostrovo alone, with the river Vodá, is said to be capable of giving a force of 34,000 H.P., besides the rivers Vardar (4,000 H.P.), Vistritsa (3,000 H.P.) and

Struma (3,500 H.P.), and the falls of Niausta (4,000 H.P.) and Verria (Kara Feria) (2,000 H.P.).

*Mines.*—The output of iron fell (in thousands of metric tons) from 377 in 1912 to 68 in 1918, of lead from 175 to 18, of zinc from 40 to 43. On the other hand the production of lignite rose from 20 in 1914 to 214. The gross output of the mines fell from 806 to 408 thousand metric tons. In 1918 the output of gross ores sold was valued at 20,920,000 fr., of roasted and dressed ores at 5,124,000 fr., the output of quarries at 7,715,000 fr.; and the net profits (for Old Greece only) amounted to 5,533,000 fr.; 8,350 men were employed and 852 women, including 4,424 underground workers (all men). There were 65 accidents. The enterprises that made the largest net profits in 1918 were the Société financière de Grèce (lignite) with 2,425,392 dr.; the Compagnie français des Mines de Laurium (various) 776,945 dr.; L. Depian, N. Raphael (magnesite) 676,883 dr.; Apostolides Brothers (chrome) 304,998 dr.; and the Anglo-Greek Magnesite Co., Ltd., 260,728 drachmae.

*Labour.*—Greece only became conscious of a labour question within comparatively recent years. In 1917 and 1918 a certain amount of unrest was met by the Government with temporary measures. In 1919 the Government succeeded in settling in a friendly manner more than 200 strikes. Labour conditions at the ports have been improved by the organization of the workers in coöperative associations dispensing with the intervention of contractors. At the Piraeus alone three such associations handled in 1919 work estimated to exceed 10,000,000 drachmae. In 1920 the discontent was less pronounced; but the working population, except to some extent at the Piraeus, voted against the Government of M. Venizelos at the elections, as a protest against the suspension of popular liberties during the war. (On June 18 1921 the leaders of the Communist party, MM. Demetratos and Sideres, with two others were arrested and imprisoned for printing and publishing certain Tolstoyan pamphlets.) At the end of 1918 there were 918 coöperative associations of various sorts, with 45,070 members; 820 of these associations were agricultural, with 32,648 members.

Greece was the first state to ratify the resolutions of the International Labour Conference held at Washington after the war (with regard to the 8-hour day, unemployment, employment of women and children, etc.). In 1911 a department of labour and social welfare had already been established at the Ministry of National Economy; in 1912 an inspectorate of labour and in 1915 a Superior Council of Labour. The employment of women and children was elaborately regulated in 1913 by legislation which was extended in 1915 to the new provinces. A series of laws provided for the health and security of workmen, especially in mines, bakeries and printing shops. A law of 1914 regulated compensation for accidents; another dealt with wage disputes (1911); and a law of 1918 secured for workmen in private employment that they should keep their places when called up for military service. Further legislation established special relief funds for miners and regulated the hours of labour; sea labourers also have their own pension fund. The employment of children under 12 years of age is forbidden, and the maximum day of six hours is fixed for children between 12 and 14 years of age. The employment of women and children in mines and quarries is forbidden; and a compulsory leave of eight weeks is accorded to women workers during maternity. Women workers (employed in currant packing and mills) organized themselves as a union and on Sept. 27 1920 demanded a uniform wage of 10 drachmae.

TABLE 7. AVERAGE PRICES IN DRACHMAE OF CHIEF COMMODITIES, 1914–20

| | 1914 | 1915 | 1916 | 1917 | 1918 | 1919 | 1920 |
|---|---|---|---|---|---|---|---|
| Wheat (100 kilos.) | 32·11 | 49·82 | 71·76 | 175·94 | 133·06 | 105·2 | 111·54 |
| Flour (100 kilos.) | 38·90 | 55·77 | 67·32 | | | | |
| Bread (the kilo.) | ·38 | ·51 | ·60 | ·76 | ·99 | ·88 | ·98 |
| Potatoes | ·23 | ·30 | ·50 | ·96 | 1·19 | ·96 | ·81 |
| Beef | 1·41 | 1·55 | 1·97 | 3·45 | 5·71 | 5·50 | 5·91 |
| Fish (fine) | 2·57 | 2·76 | 3·64 | 5·69 | 8·00 | 6·89 | 7·06 |
| Butter (cow) | 3·92 | 3·99 | 5·32 | 9·04 | 14·76 | 13·76 | 14·14 |
| Butter (sheep) | 4·14 | 4·23 | 5·12 | 9·35 | 14·84 | 13·40 | 14·40 |
| Oil | 1·18 | 1·38 | 1·60 | 2·27 | 3·81 | 4·19 | 5·66 |
| Milk | ·51 | ·54 | ·70 | 1·05 | 1·51 | 1·35 | 1·47 |
| Cheese | 1·61 | 1·67 | 2·26 | 3·35 | 5·02 | 4·43 | 4·81 |

| Coffee | 2·68 | 2·81 | 3·10 | 4·34 | 5·26 | 5·14 | 5·38 |
| Sugar | ·85 | 1·10 | 1·65 | 2·58 | 2·84 | 2·67 | 4·19 |
| Rice | ·76 | ·93 | 1·18 | 1·89 | 1·96 | 2·15 | 3·15 |
| Charcoal (the metric quintal) | 16·12 | 15·50 | 21·57 | 30·18 | 45·75 | 50·26 | 50·58 |

*Cost of Living.*—From Table 7 it will be noted that oil, olives and charcoal rose in price without intermission in 1914–20 to an extent of between 300 and 400%. Bread, beef, fish, butter, milk and cheese, after attaining their maximum prices in 1918 (from 300 to 380% above those of 1914) fell in 1919 only to rise again in 1920, beef rising 420%. Wheat attained its maximum price in 1917, and potatoes in 1918. In June 1920 prices were between three and four times greater than those of the pre-war period; and in June 1921 the cost of living was estimated to have been five times what it was in 1914. This increase after the war was mainly due to the fall in the foreign exchange value of the drachma.

*Economic Conditions.*—In 1910–12 there was a marked economic improvement throughout the country largely due to good harvests, better relations with neighbouring states and the stability of the exchange (drachma at par), due to reforms in the administration, and resulting in extension of trade, increased railway traffic and development of the merchant navy. This general improvement was interrupted by the war period, which began in Greece in 1912 and continued practically without intermission up to 1921. Greece suffered very severely from the Allied blockade of 1916–7 and the prolonged mobilization; but the many large fortunes accumulated during the war period by Greek ship-owners enabled the country to begin a quick recovery in 1919. Already in 1918 the annual returns of the wealth of the country were estimated at more than 1,600 million drachmae (agriculture 628; forests 38; industry 825; minerals 49; merchant navy 60 millions). The national capital was at the same time valued at nearly 3 milliards of drachmae (capital value of agricultural productions, 1,756,000,000; of forests, 320,000,000; of industrial enterprises, 341,000,000; of mining enterprises, 69,000,000; of merchant navy, 218,000,000; total 2,704,000,000). This is manifestly a very incomplete inventory; and, if the potential wealth of Thrace and Ionia be taken into consideration, it is clear that, with a progressive administration capable of ensuring peace at home and abroad, the country might expect a period of great prosperity. Unfortunately, the recovery begun in 1919 was again interrupted at the end of 1920 by the revolutionary restoration of King Constantine, resulting in the "economic blockade," the suspension of credits in the Allied countries and the consequent interruption of trade. There were large issues of paper money, and the drachma fell rapidly to 60 and finally (May 1921) to 100, after which the Government, by restricting all transactions to a syndicate or "consortium" of leading banks, artificially fixed the rate of exchange at between 60 and 70 drachmae to the pound sterling.

## POLITICAL HISTORY, 1910–21

*First Venizelos Ministry.*—In Jan. 1910 the Military League, embarrassed at the completeness of their success, had called Venizelos from Crete as their political adviser, and Venizelos, immediately assuming the effective leadership, had by the end of March arranged for the dissolution of the revolutionary league on the convocation of a National Assembly, which should conciliate the necessary reforms with the usual procedure of constitutional government. When the National Assembly met on Sept. 21, Venizelos, who having himself been elected a member had in deference to the protests of Turkey resigned his position in Crete, again took the less revolutionary course, and insisted that it must be only a revisionary and not a constituent body. The dispute led to the resignation of the premier Dragoumes, and on Oct. 18 King George asked Venizelos, who had won the enthusiastic support of the Athenian populace, to succeed him in the Government. The old party leaders, more alarmed by the rise of a new and popular man than by the proposals of the revolutionary officers, now combined to leave him without a quorum; thereupon Venizelos dissolved the Assembly and appealed to the people. New elections were held (Dec. 11), and without the help of any party organization he was returned with a tremendous majority, winning 300 seats against 64 retained by his opponents.

The second revisionary National Assembly met on Jan. 22 1911, and inaugurated a period of energetic reform. The administration was freed from corruption, partly by the hard work of Venizelos, and partly through the fact that his electoral triumph had shattered the old party machinery in the provinces. By the beginning of June the Assembly had settled the following revisions of the constitution: foreign officers were made eligible for service of State, and accordingly foreign missions were at once summoned to Athens to reorganize the services—English officers for the navy, Italians for the gendarmerie and French for the army, in which the Crown Prince was reinstated as Inspector-General. Elementary education was to be free and compulsory. The official language was declared to be that of the constitution, without prejudice however to literature, while, after a violent recrudescence of the agitation "to defend the purity of the language" under the leadership of a certain Professor Mistriotes, who finally had to be suppressed by the

Government, the translation of the Scriptures was forbidden without the consent of the Church. Expropriation was defined, thus enabling Venizelos to settle (April 2) on a basis of voluntary sale an agitation among the peasant cultivators of Thessaly against speculative landlords who had bought up the estates of Turkish feudal beys after the annexation of 1881. No soldiers, mayors or other public servants were to be eligible for the Chamber, the quorum of which was to be one-third of the total number of deputies. The Council of State (instituted in 1864 and abolished in the following year) was revived; and security of tenure was enjoined for judges and other public officials (in order to put an end to the "spoils" system, which however was still prevalent in 1921). In March diplomatic relations, suspended since 1905, were resumed with Rumania; and better relations of the Christian communities in Macedonia, where their "disarmament" had been carried out with great severity since 1910 by Shevket Torgut Pasha, led to an Easter visit of 300 Bulgarian students to Athens, and enabled Venizelos to put forward in April the first suggestions of a defensive alliance against Turkey—which on Sept. 29 became involved in war with Italy.

On Jan. 3 1912 the National Assembly was dissolved, and at the elections for an ordinary Chamber on March 25 Venizelos won 150 seats out of 181. To this Chamber 69 members were elected by a Cretan revolutionary assembly, which, assuming the government of the island on the outbreak of Turkey's war with Italy, had already tried to send a number of deputies to the National Assembly; these had been arrested by the international forces (Dec. 15 1911) and detained at Suda Bay till the dissolution. Of the 69 Cretans elected to the new Chamber 19 were arrested by H.M.S. "Minerva" and detained at Suda (April 28–June 6 1912); others made their way to Athens and attempted to take their seats on June 1. Venizelos however, by troops and persuasion, succeeded in excluding them from the opening sitting and then adjourned the Chamber, thus avoiding an inopportune and premature provocation of Turkey.

Meanwhile more definite and official approaches had been made to Bulgarian friendship. The Crown Prince had visited Sofia on Feb. 2 for the coming of age of Prince Boris. The Serbo-Bulgarian Treaty of Alliance had been signed at Sofia on March 13. On May 29 a secret treaty of alliance between Greece and Bulgaria was signed at Sofia, by which the two Powers bound themselves to act together "with all their armed forces" for the defence and preservation of equal rights and privileges for their nationals in the Turkish Empire. A special clause however declared that the stipulations of the Treaty should not be binding in case of an outbreak of war between Greece and Turkey in consequence of the admission of Cretan deputies to the Greek Chamber. The military convention annexed to this Treaty was not signed till Oct. 5. During the summer the condition of the Macedonian races had become desperate. A revolt had broken out in Albania; the Turkish troops had mutinied at Monastir; and bombs thrown at Kochana had succeeded in provoking them to massacre. On Sept. 30 the Balkan States, beginning to mobilize, made an united *démarche* at Constantinople, in the nature of an ultimatum, demanding immediate reforms in Macedonia. On Oct. 8 1912, the Powers, who with the exception of Russia had remained unaware of the new grouping in the Balkans, addressed to Sofia, Belgrade and Athens a severe warning, promising that they themselves, "relying on Article 23 of the Treaty of Berlin, would take in hand the restoration of administrative reforms in European Turkey, in the interest of the populations concerned, on the understanding that such reforms should not infringe the sovereignty of the Ottoman Empire." But on the same day King Nicolas of Montenegro declared war against Turkey. On Oct. 14 the Greek Chamber met, and the Cretan deputies were admitted, an act which denoted the formal annexation of the island, to which the ex-premier S. Dragoumes was sent as governor.

*Balkan War.*—Turkey declared war on the following day against Bulgaria, Serbia and Montenegro, but not against Greece, who was offered the island of Crete and the long-refused permission for the construction of the railway between Salonika and the Thessalian frontier which should connect Athens with Europe, if she would remain neutral. The offer is said to have tempted King George. But Venizelos, who before making the arrangement with Bulgaria had done all that was possible to arrive at a friendly settlement with the Turks, actually offering to pay a small tribute and acknowledge Turkish sovereignty over Crete if the Porte would recognize the right of the Cretan deputies to sit in the Greek Chamber, realized that it was now of supreme importance that Greece should not be left out of the new grouping; and he proved his country's loyalty to the Balkan Alliance by declaring war against Turkey (Oct. 18).

The Greek forces immediately crossed the frontier, and on Oct. 22 sharply defeated the Turkish army, which made a first serious attempt to resist the invasion at Sarandoporon. After occupying southern Macedonia the Crown Prince, who was in command, intended to march towards Monastir, but was diverted by urgent instructions from the Government that for political reasons the primary objective of his army must be Salonika. He accordingly wheeled his forces towards the north-east and fought another two days' battle at Yenitsa. Three days later, on Nov. 8, the feast of its patron saint Demetrius, the town of Salonika, after negotiations inaugurated by the foreign consuls, surrendered to him with the whole Turkish garrison of 30,000 men. Four days afterwards the Greek army again turned westward in order to clear western Macedonia of the Turkish forces which had been threatening their left flank, and on Nov. 20 at Florina they joined hands with the Serbians who had now taken Monastir. The successes of the army gave the Greek people a new self-confidence. But a delicate situation arose when, two days after the occupation of Salonika, a Bulgarian army, after a forced march over the mountains, entered the town, claimed a sort of condominium, displaying an increasing hostility towards the Greek authorities. Meanwhile the Bulgarians had swept through Thrace and invaded Adrianople but had been held up by the lines of Chatalja. By the end of the month the Turks, holding nothing in Europe, outside those lines, but the fortified towns of Adrianople, Scutari and Yannina, signed an armistice (Dec. 3) with Bulgaria, Serbia and Montenegro, but not with the Greeks, who were thus enabled to maintain the blockade of the Dardanelles and to transfer their major activity to Epirus, where an army under General Sapundzakes had driven the Turks into Yannina.

The Greeks took part, however, in the conference which met in London on Dec. 16, when the Balkan allies met the Turks and demanded the surrender of all that they held, together with the fortresses invested. Under pressure of a note from the Powers the Grand Council at Constantinople (Jan. 22 1913) had finally decided to accept these terms, when the extreme Nationalists under Enver Bey expelled the Grand Vizier Kiamil Pasha and murdered Nazim Pasha, the commander-in-chief. Hostilities were resumed on Feb. 3. The Greek army in Epirus, now heavily reinforced and under the immediate command of the Crown Prince, carried Yannina by storm (March 6); and 11 days later the victor acceded to the throne as King Constantine, his father having been assassinated at Salonika.

Bulgarians and Serbians stormed Adrianople at the end of the month, and on April 22 Scutari surrendered to Montenegro. Negotiations between the belligerents were reopened in London on May 20, and by the Treaty of London (May 30) Turkey ceded collectively to the Balkan allies all her European territory west of a line drawn from Enos on the Aegean to Midia on the Black Sea, leaving the questions of Albania and the Aegean islands (except Crete, which was at last to be definitely annexed to Greece) to be settled by the Powers. Unlike Bulgaria's treaty with Serbia, the Greco-Bulgarian Treaty contained no territorial provisions. A friendly division of the surrendered territory, however, could probably have been arranged between the three allies, had not England been induced, with the object of setting up an independent kingdom of Albania, to support the Austrian proposal to exclude Serbia from the Adriatic. This unexpected exclusion caused Serbia to reconsider the provisional partition of Macedonia arranged in the treaty with Bulgaria;

while Bulgaria adopted such a threatening and aggressive attitude to both her allies that, on June 2, Greeks and Serbians signed a defensive alliance, intended primarily to prevent Bulgarian hegemony in the Balkans, but clearly drafted so as to be binding in case of attack by any third power. Bulgaria, hoping to rush Salonika and anticipate the result of further negotiation or arbitration, attacked the Greek and Serbian lines on June 29, but was heavily defeated at Kilkish (July 4) and compelled to retire fighting towards the Bulgarian frontier. Seeing the Bulgarians punished, Rumania intervened to claim territorial concessions in the Dobruja. On July 20 the Turks reoccupied Adrianople. Neither the Powers nor the two surviving partners of the Balkan Alliance protested against this violation at Bulgaria's expense of the Treaty of London.

*Peace of Bucharest.*—The Rumanian intervention brought the belligerents to terms, and peace was signed at Bucharest on Aug. 10. The frontier of Greek Macedonia was carried eastwards as far as the river Mesta (Kara Su), thus excluding Bulgaria from the coveted Aegean port of Kavalla, and northwards as far as Florina and Doiran. Venizelos had no hope of mitigating Bulgarian enmity and restoring the shattered alliance by any further concessions, and was driven to base his policy on a balance of power, hoping to immobilize Bulgarian ambitions by the standing threat of the alliance with Serbia and the new friendship with Rumania.

*Northern Epirus.*—The Greek frontier in Northern Epirus depended on the delimitation by the conference of the Powers in London of the new principality of Albania, and the decision of the international commission appointed for this purpose was subject to Italy's refusal to allow Greece to hold any of the Adriatic littoral north of Corfu. When the decision of this commission was promulgated (Florence, March 1914), Greece obediently withdrew her troops to the south of the new frontier, but the inhabitants of the evacuated district, which included Chimara, Argyrokastro, and Koritsa, were so thoroughly Greek in sentiment that they immediately proclaimed a provisional government, and finally obtained from the Albanian Government, subject to the international commission of control, certain rights of autonomy with which they were provisionally satisfied (Corfu, May 17 1914). In Oct. 1914, after the departure from Albania of Prince William of Wied, Greece was authorized by the Entente with the consent of Italy to reoccupy this district of northern Epirus with her troops in order to preserve order, on the express understanding that the question should be finally settled by the Peace Congress. Greek forces were obliged to hand over these districts to Italian occupation in 1916, but were authorized to reoccupy them after the war (Dec. 1919). The Italians accordingly evacuated Epirus and French troops the Koritsa district in April and May 1920. Subsequently Chimara and other of the disputed districts were restored by the Greek authorities to Albania (June 1 1921), who appealed to the League of Nations against the frontier claimed by Greece. The Council of the League of Nations, however, relying on the declaration of the Powers in 1914 decided June 28 1921 that only the Supreme Council of the Allies (then represented by the Ambassadors' Conference in Paris) was competent to determine the Albanian frontiers.

*The Dodecanese.*—Greece also awaited the decision of the Powers with regard to the islands of the Aegean; and in the solution of this question it happened again that Italy was the Power responsible for checking Greek aspirations. Italy had occupied during her Tripolitan war with Turkey the twelve islands of the southern Sporades, known as the Dodecanese, all of which, except Rhodes and Kos, were barren rocks inhabited by Greek sponge fishers, and by the Treaty of Lausanne (Oct. 18 1912) had retained them only as security for the evacuation of Tripoli by the Turkish troops. During the Balkan War the Italian occupation had naturally protected these islands from attack by the Greek fleet which had successfully seized from Turkey all the other islands of the Aegean. Sir Edward Grey declared on Aug. 12 1913 that "Italy had never allowed England for one moment to doubt that it was her intention to complete that part of the Treaty of Lausanne with regard to these islands and retire from these islands when Turkey had completed her part; England had complete confidence in her good faith." On Feb. 13 1914 the Powers recognized Greek sovereignty over all the islands seized by the Greeks during the war, with the exception of Tenedos and Imbros, which were supposed to command the entrance to the Dardanelles; but still the Italians gave no sign that their occupation of the Dodecanese was either conditional or temporary. It remained for Venizelos after the World War to negotiate with Signor Tittoni an agreement (July 29 1919) by which all the outstanding questions between Italy and Greece were compromised, and all the islands were to revert to Greece, with the exception of Rhodes, the cession of which was to be dependent on the result of a plebiscite to be held within 15 years of England's cession of Cyprus: and Venizelos refused to sign the Treaty of Sèvres in Aug. 1920 until the official and obligatory character of this agreement had been recognized by the Supreme Council. The islands of Tenedos and Imbros together with the island of Lemnos were occupied during the World War by the British fleet; and the British forces under Gen. Finlayson handed the three islands over to the Greek authorities in accordance with the Treaty of Sèvres on June 25 1921.

The decision of the Powers after the Peace of Bucharest, assigning to Greece sovereignty over the Aegean islands, was not recognized by the Turks, who commenced a boycott of Greek shipping and an organized persecution of Greeks in Asia Minor. Fortified by the opportunity of buying two battleships which would have secured for their fleet the supremacy of the Aegean, Turkey plainly threatened to reopen the war. In June 1914 the situation was indeed so alarming that Venizelos appealed for Serbian support. The Serbs in their reply did not hesitate to recognize the obligations of the Greco-Serbian alliance; and after pointing out that their immediate participation in a third war was for obvious military and financial reasons extremely undesirable, if not impossible, they proceeded to address a strongly worded protest to the Grand Vizier at Constantinople, with the result that he felt that they were quite prepared to declare war in defence of Greek interests. They also requested the other Powers to use all possible pressure to restrain Turkish provocation. They showed such goodwill in the exercise of these diplomatic measures that on June 22 1914, M. Streit, then Foreign Minister in the Government of Venizelos and subsequently King Constantine's private adviser, telegraphed to Belgrade "the lively gratitude of the Greek Government for the Serbian *démarche* at Constantinople on the subject of the persecution of the Greeks in Turkey, a *démarche* which has proved once again the solidarity of our alliance and the bonds of affection which unite the two peoples." Meanwhile Venizelos, having sounded the other Powers and learned that, owing to Germany's refusal to take part, there was no chance of a naval demonstration by the Great Powers in order to compel the Turks to respect the decision of the London conference with reference to the Aegean islands, succeeded (July 8 1914) in buying for immediate delivery two American battleships, which deprived the Turks of any chance of challenging the superiority of the Greek fleet. Turkey at last consented to negotiate,[1] and Venizelos was on his way to meet the Grand Vizier at a neutral capital, when at Munich he learnt of the outbreak of the World War. There also he received the question from the Serbian premier as to the attitude Greece would adopt in view of the Austrian invasion. Venizelos declared at once (Aug. 2) that "with regard to the war with Austria he must await fuller information and consultation with his colleagues in the Government before he could determine the answer to be given; but that with regard to the possibility of a Bulgarian attack the place of Greece would be at the side of her Serbian ally in order to keep their common enemy at a respectful distance, and ensure the maintenance of the Treaty of Bucharest." This declaration was officially renewed on his return to Athens.

*The World War.*—On Aug. 4 1914 Germany informed Greece both officially and by private telegram from the Kaiser to King Constantine that she had concluded alliances with Turkey and Bulgaria, and invited Greece to join the Germanic powers in a united campaign against a Slav domination in the Balkans. This invitation was declined by King Constantine in terms of warm personal friendship. Venizelos, on behalf of the Greek Government (Aug. 8), supplemented the King's rather regretful reference to the impossibility of Greek coöperation with Germany owing to the Mediterranean supremacy of the British and French fleets, by suggesting the renewal of a Balkan federation *to include Bulgaria* for the maintenance of neutrality. The hostile attitude of Turkey, however, now once more strengthened by the entry into the Dardanelles of the German cruisers "Goeben" and "Breslau," gave little hope of preventing the war from spreading in the Near East; and on Aug. 23 Venizelos officially declared with full authority that "Greece, not merely

[1] These negotiations were subsequently resumed, and resulted (Nov. 14 1914) in an agreement known as the Treaty of Athens.

in consciquaness of her indebtedness to the great guaranteeing Powers, but from a clear perception of her vital interests as a nation, understood that her place was at the side of the Powers of the Entente; and that whereas in the war that was being waged it was not possible for her to take a military part, since she could not, owing to the danger from Bulgaria, reinforce the Serbians, much less send an expeditionary force to France, nevertheless she thought it her duty to declare to the Powers of the Entente that, if Turkey went to war against them, she placed all her forces naval and military at their disposal for the war against Turkey, always presupposing that she was to be guaranteed against the Bulgarian danger."[1] The results of this voluntary declaration, made at a time when the Germans were advancing triumphantly towards Paris, won an assurance from the British Government that the Turkish fleet would not be allowed to leave the Dardanelles, the consent of the three Powers and of Italy to the provisional reoccupation of northern Epirus by the Greek army, and a cordial telegram from King George V. of England to King Constantine. But shortly afterwards Admiral Mark Kerr, instructed by the British Admiralty to concert plans with the Greek staff for a possible occupation of Gallipoli, was surprised to be told by King Constantine that he had no intention in any circumstances of declaring war against Turkey unless Turkey first attacked Greece. Venizelos in a memorandum to the King (Sept. 7) explained the reasons for forestalling an inevitable Turkish attack, Turkey in her persecutions of the Greek element in Asia Minor "having long been waging a war which had never been declared"; he protested against the King's excessive fear of offending Germany; and finally offered to resign. He was induced to remain in office, but insisted on the resignation from the Government (Sept. 28) of M. Streit, Minister for Foreign Affairs, who was understood to have advised the King without the knowledge of his colleagues; Streit indeed continued to be the private political counsellor at the Palace. A month later Turkey entered the war.

In Jan. 1915 England on behalf of the Allies once more invited Greek assistance, not against Turkey but for the relief of Serbia, by a well-meaning attempt to reconstitute the nascent Balkan federation of 1912. Serbia, in the hope of eventually reaching the Adriatic, was to secure Bulgarian coöperation by certain concessions in Macedonia; and if Greece would facilitate these concessions the three Powers would gladly acknowledge "the right of Greece to very considerable compensations on the coast of Asia Minor" (Jan. 24 1915). Venizelos, whose own policy had always tended whenever possible towards a Balkan federation, explained to King Constantine in a memorandum of Jan. 11 the necessity of securing the coöperation not only of Rumania but of Bulgaria as well, and declared that in exchange for Bulgaria's active coöperation in a war which must result in "the creation of a real Magna Graecia" he would not hesitate to sacrifice Kavalla (the port in western Macedonia chiefly coveted by Bulgaria); and in a third memorandum (Jan. 17) he defined the territory in Asia Minor—"a province of 125,000 sq. km. as large as and no less rich than the whole kingdom of Greece and containing 800,000 Greek inhabitants"—which might be secured in exchange for the 2,000 sq. km. of the Kavalla district, the population of which need not necessarily be lost to Greece. These negotiations were frustrated primarily by the attitude of Bulgaria.

On Feb. 19, at the time of the preliminary attack by the British fleet on the Dardanelles, Venizelos, realizing that a landing force would be required, took up again the question of Greek coöperation. By a fourth memorandum (unpublished) he believed that he had succeeded in gaining the King's assent to the mobilization of one army corps to join in the Allied attack on Turkey, but he was checked by the immediate resignation of Col. John Metaxas, chief of the general staff. He therefore called a Crown Council of former premiers, under the presidency of the King (March 5), at which his proposal was favourably received by the leaders of all parties, including the ex-premiers Ralli and Dragoumes. At the suggestion of the ex-premier Theotokes a second Crown Council was held (March 6) in order to hear the reasons for the continued opposition of the general staff. At this meeting Venizelos, influenced by information from Constantinople (Feb. 29) that the Turks were already preparing to evacuate their still unfortified capital, attempted to meet the arguments of the general staff (against the denudation of the frontier of troops which might be required in view of the possibility of a Bulgarian attack), by proposing that not an army corps but only one division should be sent to the Dardanelles. This proposal was unanimously adopted by the Crown Council and even the ex-premier Theotokes, who never wavered in his personal preference for neutrality, advised the King that it was his duty to follow the advice of the Government of Venizelos without further hesitation. Nevertheless, King Constantine refused, demanded the resignation of Venizelos (March 6), and dissolved the Chamber (April 10).

*Venizelos in Conflict with the King.*—A new Government was formed on March 10 by D. Gounares, who declared that the basis of Greek policy in loyalty to Serbia would remain unaffected by the change of Government; and in the following month, when Bulgarian "irregulars" raided the Nish-Salonika railway, associated Greece with the Serbian protest at Sofia. The Minister for Foreign Affairs, Zografos, "honestly adopted all that was possible of the Liberal policy, the foundation of which was a very benevolent neutrality towards the Entente with a firm determination never to allow a Bulgarian attack on Serbia"; he continued for some weeks to negotiate with the Governments of the Entente, who on April 11 specifically offered the vilayet of Smyrna, but his sincere proposals were overtaken by the extravagant stipulations attached to them by the general staff. In the following month further offers of Greek coöperation were made through less formal channels, such as the suggestion (May 2) that Greece would lend the assistance of her fleet if guaranteed against Bulgarian attack. But the French Government, to which at this period most of these offers were addressed, replied that all proposals of assistance must be unconditional. Other offers were left unanswered by the French and British Governments, which were convinced of the insincerity of these proposals; not only because the Government of Gounares had taken office on the specific programme of maintaining Greek neutrality, and was believed to be putting forward these suggestions (as ex-President Poincaré subsequently stated on Dec. 9 1920) as a manœuvre directed against the Liberal party on the eve of the elections; but also because the real government of the country had been taken over by the King, who from this time forward assumed the right of negotiating directly with foreign Powers either through their ministers in Athens or through his brothers, one of whom would be sent from time to time on a tour of the western courts.

King Constantine was at the beginning of the war honestly neutral, but his mind was overwhelmingly impressed by German military prestige, and influenced by the German training of some of the most capable officers of the general staff. He was convinced by sentiment and environment, in spite of the logic of Venizelos, that Germany was going to win. The German press propaganda, well organized under Baron Schenck, was meanwhile very active, and as Germany had nothing to hope for from Greece beyond her neutrality, it directed all its efforts not only to strengthen the politicians opposed to Venizelos but also to popularize the King's own person and policy. At the elections which were finally held on June 13 the voters were definitely told that a vote cast against Venizelos, against the Liberal party, meant a vote for their King and a vote for peace. It is therefore somewhat remarkable that although Venizelos himself took no part in the elections, his party, with a programme of intervention, won a majority of 58 seats in a house of 310. (In Old Greece alone they won 123 seats out of 184, but lost heavily in Macedonia.)

In spite of this result Gounares remained in office. As the King had fallen ill, Gounares insisted that this precluded him from considering any change of policy that might be necessitated

[1] The exact terms of this declaration have never been published; the text is taken from a speech of Venizelos in Aug. 1917.

by a change of Government; and the interval was used by the German propaganda which had now obtained a firm hold on a certain section of the press, in conjunction with the counsellors of German sentiment within the palace, to wean public opinion from the ideas of confidence in Venizelos and loyalty to Serbia. In July an agreement was signed between Turkey and Bulgaria, an agreement which was declared by *The Times* correspondent in the Balkans (July 15) to be "of no political importance." The Greek press, less credulous, perceived the danger, and on Aug. 2 Gounares officially declared that "a Bulgarian attack on Serbia could not leave us indifferent, and the Turco-Bulgarian agreement will only strengthen the bonds between Greece and Serbia." Yet it is significant that on July 30 the Greek minister at Bucharest was informed by his English colleague that Germany had formally promised Bulgaria that Greek neutrality was definitely assured even in face of a Bulgarian attack on Serbia.

At last on Aug. 23 Venizelos was recalled to office. He had to face a strong opposition, composed of jealous party leaders, great provincial families, and local politicians whose positions had been endangered by the reforms of 1910–1; and this opposition of personal hostility to Venizelos was cleverly utilized by the German propaganda, which had only to identify the policy of loyalty to Serbia and to the protecting Powers with the figure of Venizelos in order to make this mixed opposition into a compact body of opinion working in effect if not in intention for Germany. The first act of Venizelos on taking office was to inform Serbia as well as Germany and the protecting Powers that his policy was to preserve Serbia from Bulgarian attack, and his dispatch to the German Government expressed the hope that Germany "would not fail to exercise all her influence in order to restrain Bulgaria from attacking Serbia, and would thus ensure the preservation of peace on the Greek frontiers." Germany and Bulgaria, however, had received information from other quarters to a very different effect. Bulgaria mobilized on Sept. 23, and three days later the Bulgarian premier publicly reassured his followers on the subject of Greek and Rumanian neutrality. Venizelos accordingly ordered a counter-mobilization, and was then reminded at the Palace that, as the King did not want to fight Germany, this must be regarded only as a "precautionary measure"; he agreed, and, having received an assurance from Sofia that Bulgaria had no intention of attacking either Greece or Serbia, explained in the Chamber (Sept. 29) that in spite of Bulgaria's declared intention of maintaining an "armed neutrality" the situation was grave, and suggested that it might be easily improved by a simultaneous demobilization. At this time the opposition press began to develop for the first time the suggestion, which proceeded from the general staff, that Serbia was not in a position to carry out her obligation, under the military convention annexed to the Greco-Serbian Treaty, to put 150,000 men into the field for the operations against Bulgaria. And Venizelos, in the course of his discussions with the King, who at this time disputed neither the validity of the Greco-Serbian Treaty nor the authority of his prime minister as head of a constitutionally elected Government, but could only repeat that he did not want to fight Germany, was authorized to meet the arguments of the general staff by asking France and England to supply in place of Serbia the 150,000 bayonets stipulated by the military convention. The King subsequently changed his mind, but the invitation had already been sent. On Oct. 2 a note from the French Minister announced the arrival at Salonika of the first French troops "in order to assist Serbia," France and England assuming "that Greece . . . will not oppose measures taken in the interests of Serbia who is her ally." At this the King pointed out that the troops must not land until Bulgaria attacked Serbia; for the Treaty would not come into force until Bulgaria declared war, and until that [illegible] the landing of foreign troops would be a violation of [illegible] neutrality; and Venizelos accordingly himself formally [illegible] against the disembarkation, which would, however, [illegible] understood, be facilitated in every possible manner. On [illegible] 4 Venizelos explained in the Greek Chamber his intention of respecting the Greco-Serbian Treaty and using the Greek army to protect the Serbian flank: "Greece has no immediate quarrel with Germany and Austria: but if in the course of events in the Balkan peninsula she should find herself faced by other Powers, she will act as her honour demands. Such is the policy of the present Government. I would add that it has been approved by the Greek nation at the recent elections." In the debate that followed M. Gounares declared for the first time his view that the Treaty with Serbia was only applicable to a purely Balkan war. Venizelos received the confidence of the Chamber by a majority of 46. On the following morning he was dismissed from office by the King, who entrusted the formation of a Government to M. Zaimes.

M. Zaimes announced a policy of "armed neutrality," and in replying on Oct. 11 to a Serbian appeal for assistance (which England supported with the offer to cede Cyprus, an offer withdrawn on Oct. 22), he developed the argument that the Treaty had a "purely Balkan character," and applied only to a "war between one of the Allied States and a single other Power." He added the remarkable sophism that "even in the course of the European War, Greece was ready to face the Bulgarian danger. . . ." But Greece anticipated a Bulgarian attack undertaken separately even though in conjunction with other hostilities directed against Serbia. The hypothesis of a combined attack with other Powers was outside the question. The Venizelist majority in the Chamber continued to support the new Government, on the understanding that Greek neutrality, as announced by M. Zaimes, was not less "benevolent" than before, until Nov. 3 when an incident produced by Gen. Giannakitsas, the Minister for War, provoked Venizelos to defeat the Government by 33 votes. On the following day Gen. Giannakitsas was given an appointment at court. The King dismissed the Chamber (Nov. 6), and a Government was formed by M. Skouloudes, a wealthy old man of good repute but weak character, who elaborated the now usual declaration (Nov. 9) of "*very* benevolent neutrality" towards the Entente.

The elections for the new Chamber were held on Dec. 19. Venizelos and the Liberal party decided to abstain from the polls, as a protest against what they regarded as an unconstitutional use of the King's authority in this second dissolution of the Chamber. The Liberals had the barren satisfaction of noting that only 230,000 votes were polled as against 720,000 recorded in the previous June. M. Skouloudes, now wholly under the influence of the Palace and the general staff, soon found that the practice of "*very* benevolent neutrality" was less easy than the profession. He was driven to admit that there were only two sorts of neutrality, voluntary and involuntary. In April he refused permission for the use of Greek railways for the transport of the Serbian army overland from Corfu to Salonika; and the manner of his refusal gave further offence to France.

On May 23 he received from the German minister a notification that Fort Rupel, a key position of great importance in the passes entering eastern Macedonia, would shortly be occupied as a "purely defensive" measure and without prejudice to Greek sovereignty. Two days later the fortress and its contents were duly surrendered by the Greek garrison to German and Bulgarian troops. M. Skouloudes possibly argued that if he was to remain neutral he could not refuse to Germany facilities which he had granted to the Allied forces at Salonika. Unfortunately he denied all knowledge of the incident when questioned in the Chamber on June 6, and his attitude was the beginning of a period of almost open hostility between the Greek Government and the Allies. "By adopting a passive attitude in face of an invasion which might weaken the position of the Allies, Greece appeared to be abandoning her policy of benevolent neutrality,"—telegraphed the Greek *chargé d'affaires* from Paris. The incident led to violent attacks on King Constantine; he was as violently defended by the German ptopaganda and by his own supporters in Athens; and now, embittered by these attacks, it must be assumed that he began definitely to desire a German victory.

On June 3 Gen. Sarrail proclaimed martial law at Salonika On June 21 the Allied ministers presented a note, drafted a

the British Legation, in which they demanded in the name of the three guaranteeing Powers (*Puissances garanties*) the demobilization of the army, a general election, the formation of a non-political or "business" ministry to carry out these changes, and the replacement of certain police officials who were supposed to be in close relations with the German propaganda. M. Skouloudes resigned, and M. Zaimes again took office (June 23) in order to accept performance of the note. Demobilization was at last begun on June 29. The army had been kept mobilized at great expense to the State for nine months, and as the Government had had no intention of entering the war, the only reason for keeping it on a war footing had been in order to increase the political power of the general staff. In order to continue this influence the demobilized men were now organized into "leagues of reservists" pledged to impose what was now definitely known as the King's policy in opposition to that of the Liberal party, and to form in practice centres of German propaganda and of active hostility to the Allies. In July and Aug. the Bulgarians advanced, and occupied almost the whole of eastern Macedonia, including the port of Kavalla, the Greek garrison of which, amounting to 8,000 men, was instructed to surrender to the invaders (Aug. 28) and was subsequently deported and interned at Görlitz in Germany. The Bulgarian invasion of Macedonia greatly embittered the feelings of the Entente Powers and of Greek Liberals against King Constantine; and when the invasion extended to western Macedonia it also led to the abandonment (very unfortunately) of the proposed election, the Liberals not caring to insist on carrying through an election without the Macedonian constituencies. The Chamber was not dissolved but adjourned (June 29), and was recalled on Nov. 13.

The evident sincerity of M. Zaimes, however, produced a temporary improvement of the relations between the Allies and the Greek Government. Venizelos promised to give his unconditional support to any government that would follow a policy of intervention; and King Constantine, in order to calm the popular excitement produced by Rumania's decision to enter the war and by the Bulgarian invasion of Macedonia, let it be known that he had authorized M. Zaimes to reopen negotiations with the Entente. On the eve of Rumania's declaration of war (Aug. 27) Venizelos at a mass meeting of his supporters made a final appeal to the Government and to the King to take this opportunity of associating Greece with the Allies before it was too late. King Constantine refused to receive a deputation elected by this meeting. On Sept. 1 a revolutionary movement was started by some of Venizelos's most prominent supporters at Salonika (P. Argyropoulos and Col. Zymbrakakes), who established a Committee of National Defence with the object of reënforcing the Allies with such troops as they could gather and helping them to drive the Bulgarians from Greek soil. On Sept. 2 a further Entente note, supported by the presence of the Allied fleet at the Piraeus, demanded the control of the posts and telegraphs and the expulsion of certain enemy agents who under the protection of the Palace were thought to be endangering the plans of the Allied forces at Salonika; and on Sept. 11 Zaimes resigned, finding it impossible, owing to the action of the Palace, honestly to satisfy the Allies by stopping the hostile tendencies in the capital.

A new Government was not formed till Sept. 16, when M. Kalogeropoulos took office but was not recognized by the Allied ministers, whom he was unable to satisfy as to his capacity to restore a more tranquil atmosphere. On Sept. 25 Venizelos left Athens, and, being joined in Crete by Admiral Kountouriotes and Gen. Dankles, proclaimed a revolutionary movement, intended not to displace the throne and the central Government but to force their hands by concentrating and displaying the strength of the Liberal and interventionist parties. This triumvirate, after gathering supporters by a tour of the Aegean islands (Samos, Mytilene and Chios), landed two days later at Salonika and, absorbing the Committee of National Defence, organized a Provisional Government which took on all the functions of a sovereign administration in alliance with the Allied forces, raised a Greek "Army of National Defence," and a month later declared war against Germany and Bulgaria. It was not, however, officially recognized by the Allied Powers. "Whenever we find part of the Greek community which is in fact under the Government of M. Venizelos," said Lord Robert Cecil after an Allied conference at Boulogne (Oct. 20), "where the majority of the population recognize him as their Government we recognize it as *de facto* the ruler of that portion of Greece." This cautious attitude contributed to the prestige still enjoyed by King Constantine at Athens, and enabled his League of Reservists to terrorize the ordinary population throughout the country. The report was spread that Venizelists were fomenting a revolution in Athens, and it was suggested that anyone who favoured the Allies was a dangerous rebel. On Oct. 10 a new government had been formed by Prof. S. Lambros, who obeyed the Palace and the general staff.

On Nov. 19, at 48 hours' notice, the French Admi. Dartige du Fournet, in command of the Allied fleet, expelled from Athens the ministers of the enemy Powers, Gen. Sarrail, who had just reoccupied Monastir, being now seriously alarmed about the safety of his left flank owing to the continual communications which were said to be passing between the Palace at Athens and the headquarters of the Central Powers, and owing to the appearance of Greek irregular bands in the neutral zone which had been established in Macedonia between the spheres of the Athens and Salonika Governments. On Nov. 24 the Admiral demanded the surrender of a considerable part of the Greek army's artillery;[1] this demand was the result of a private interview between the King and a French deputy, M. Bénazet, who had visited Athens at the end of Oct. and understood that the King would willingly comply. Two days later some detachments of French troops were landed, followed on Dec. 1, the day on which the time limit accorded by the Admiral expired, by 2,500 French and British marines, the Admiral being confident that no resistance would be offered and that only a show of force was needed. The troops were approaching Athens when they were attacked with machine-gun fire by Greek troops posted in prepared positions. Many were killed and wounded, and the remainder were escorted as prisoners back to their ships, while the Admiral himself was a prisoner in the Zappeion gardens, which he had made his headquarters, until the Allied fleet dropped a few shells in the gardens of the Palace. The French and British ministers retired to their warships and for two days the capital was given over to the excesses of the troops and reservists, who, excited by reports of a Venizelist plot to dethrone the King, hunted down as rebels and traitors all prominent citizens suspected of Venizelist tendencies. On Dec. 7 the Allied fleet began a close blockade of the Greek coasts. A week later a note from the Three Powers and Italy demanded reparation, and the withdrawal of all troops and arms to the Peloponnesus; and on Dec. 19 England officially recognized the "Provisional Government of National Defence," and sent Lord Granville to Salonika as British envoy. On Dec. 31 a further note from the Protecting Powers demanded a reduction of armed forces, the transfer of all armament to the Peloponnesus, the cessation of Reservists' meetings and of the arming of civilians, the re-establishment of the control officers (who had been expelled from the telegraphs, etc., on Dec. 1), the release of political prisoners, and apologies; and on Jan. 8, after an Allied Conference at Rome, a further note gave the Royal Government a week for the acceptance of these demands, but assured it that the Provisional Government of Salonika should not be permitted to extend its power or threaten the capital.

On Jan. 16 the Government accepted these terms, and by way of apology the flags of the Allies were formally saluted by Greek troops at the Zappeion. The blockade was, however, maintained, as King Constantine and his Queen were holding out in expectation of a German offensive in Macedonia, and, while organising Greek irregulars in the Thessalian neutral zone, were sending frantic wireless messages to Berlin, one of which, for example, addressed to the German Emperor, prayed "that God grant you

[1] Eighteen field batteries, 6 mountain batteries, 4,000 rifles, 200 machine-guns, with ammunition, etc.

very soon a glorious victory over all your infamous enemies." Once more, however, the tension died down; King Constantine probably realized that the prospects of a German offensive on a large scale in Macedonia were very remote; his confidence must have been shaken by America's entry into the war (April); and, although the Russian revolution in March had deprived him of some diplomatic support, there were still influences abroad which enabled him to reopen relations of "friendly neutrality" when the French and British ministers returned to their legations in March. At the end of the month one or two of the Venizelist newspapers, whose presses had all been broken up in Dec. by the Royalist mob, ventured to reappear. On the other hand the replacement of the French Government of M. Briand by that of M. Ribot probably disposed France for a more drastic policy. The King's less truculent attitude, reflected in the reappearance of M. Zaimes as prime minister (May 3), was now confronted by more firmness in the councils of the Allies.

*Deposition of Constantine.*—At the end of May the Allies were at last agreed that the professed neutrality of King Constantine was not genuine enough to be respected. On June 6 M. Jonnart, a French senator, arrived in Greece as commissioner of the Three Powers, and, after conferences at Salonika, returned to Salamis and on June 11 presented the Greek Government with a note which demanded the abdication of King Constantine, "who would himself choose, in accord with the Protecting Powers, a successor among his heirs." The Greek Government, required to give an answer within 24 hours, was also informed that the Crown Prince would be excluded from the succession (on account of his German sentiments) and that the King, after his departure and subject to his good behaviour, would be guaranteed a pension of £20,000. On the following morning (June 12) M. Zaimes informed the High Commissioner that the King, "anxious as always for the welfare of Greece, had decided to leave the country together with the Prince Royal, and had chosen as his successor Prince Alexander" (his second son, born Aug. 1 1893); and the same night King Constantine left Athens and made his way to Switzerland, with his family and suite, which included his chief political adviser, M. Streit. General Dousmanes and other officers of the general staff, with M. Gounares and other politicians notorious for their German sentiments, were deported to Corsica; and with them M. Ion Dragoumes, a brilliant and rising writer, diplomatist and politician, who while not hostile to the Allies was regarded as dangerous owing to the extravagance of his hatred of Venizelos.

On June 26 Venizelos himself returned to Athens and with the members of his Government, after the resignation of M. Zaimes, took the oath of allegiance to King Alexander. French troops had been landed in Athens on M. Jonnart's arrival, and had also advanced into Thessaly to secure the harvest. Venizelos had repeatedly asked the Allies to suspend the neutral zone and allow the Salonika Government to advance into Thessaly and also to march against the Athenian Government, which could have offered very little resistance; for at the time the Salonika Government had raised an army of 60,000 men, "well organized in three divisions, with a fourth division, that of the Cyclades and Ionian islands, ready for immediate equipment." The Allies had refused the request, not wishing to permit any outbreak of civil war, however brief. They quite naturally preferred to effect the purgation of the Athenian state without bloodshed; but the presence of French troops in Athens during the month of June exposed Venizelos to the charge of having been restored to power by "foreign bayonets."

*Greece in the War.*—On June 29 the reunited Greek Government declared war against the Central Powers. The Chamber of June 13 1915, which King Constantine had dissolved on Nov. 6 1915, was recalled, and in a great speech (Aug. 26 1917) Venizelos explained to the legally elected representatives of the Greek people the causes of his policy from the beginning of the war and of two conflicts with King Constantine. Of 198 deputies present 188 voted for the resolution of plenary confidence in the Government. Yet the passions aroused by these conflicts and by the respective propagandas were not easily stilled. A large number of officers who refused to disavow their allegiance to King Constantine were cashiered, and many civil servants who refused to acknowledge the authority of the new Government were also removed. Of the civil servants all but about 400 (out of a civil service amounting to some 30,000 persons) had been reinstated at their own request by May 1920, in spite of the difficulties created by the duplication of staff effected by the Salonika administration; and of these 400 many remained unemployed, not for political reasons but on account of their official incompetence. But the reinstatement of officers was less easy owing to questions of seniority involved, and the Loyalist officers remained as an element of irreconcilable discontent to be exploited by a sedulous propaganda conducted by the ex-King Constantine from his exile in Switzerland. Several mutinies occurred during the mobilization of the army, which were quickly suppressed; but the shooting of the ring-leaders, inevitable in a state of war, left a painful impression. In Nov. 1917 Venizelos visited Paris and London, where he was entertained at the Mansion House, and secured supplies of food, all stocks having been exhausted during the Allied blockade, as well as munitions and equipment for the Greek army. By April 1918 the mobilization was complete. The Greek forces, which were successfully tested in a preliminary action at Skra di Legen (May 30), amounted in July to 10 divisions, about 250,000 men, and gave the Allies for the first time a definite superiority on the Macedonian front. The Allies were thus enabled to plan in Aug. the great offensive which was opened in the following month and culminated, after the Greek troops had distinguished themselves with the British at the storming of the Doiran heights (Sept. 22), in the capitulation of Bulgaria (Sept. 30).

*After the War.*—Venizelos arrived in Paris at the end of the year and soon became one of the leading figures at the Peace Conference, which opened in Jan. 1919. The Greek delegation signed before the Supreme Council of the Allies the Greek claims for the annexation of northern Epirus, Thrace, Smyrna with a large portion of the western littoral of Asia Minor, and the Dodecanese; and for the internationalization of Constantinople. Meanwhile Greek troops had taken part in the unfortunate French expedition to south Russia, and the Greek army and fleet had been represented in the Allied occupation of Constantinople. But the number of statistical factors involved, the tendency of the Council of Ten, not less than that of the subsequent Supreme Council of Four, to postpone difficult problems, and the conflicting ambitions and policies of the Great Powers in the Near East, combined to keep the future of Greece in suspense for two years after the conclusion of hostilities. As affecting Bulgaria the Greek claims were settled by the Treaty of Neuilly, to which was annexed a Greco-Bulgarian convention for the protection of racial minorities, etc. (Nov. 27 1919), by which Bulgaria was cut off from the Aegean. But the Turkish problem in which all the Powers were interested remained to be dealt with in the following year. The armistice concluded with Turkey (Oct. 30 1918) had unfortunately made very incomplete provision for the disarmament of the Turkish forces, and it was partly in order to restore order in Asia Minor and protect the Christian populations that Venizelos, after a first presentation of his Turkish argument, obtained an authorization for Greek troops to occupy Smyrna (May 14 1919). Unfortunately, owing to the defective arrangements of the Greek authorities, the landing was followed by a disturbance in which the Greek troops and local population got out of hand and about 20 Turks were shot down in the streets. The Greek Government immediately set up a court-martial which passed severe sentences on 48 Greeks (three of whom were executed), 13 Turks, 12 Armenians and one Jew involved in the riots. Subsequently an Inter-Allied Commission of British, French, American and Italian officers was sent out to investigate, but its report was never published as by an oversight the decision of the Supreme Council, that a Greek officer should be present at the investigations, had been ignored. In Sept. leading British residents of Smyrna testified to the admirable impartiality of the new Greek commissioner M. Sterghiades. But the suppression of this report, as well as similar incidents said

to have occurred at the end of June at Aidin, where the Turks had burned the Greek quarter and murdered many of the inhabitants, gave rise in ensuing discussions of the Turkish solution to very severe criticisms of Greek capacity for ruling a mixed population. When the Supreme Council met in London in Feb. 1920 the presentation of the Greek case was opposed by a strong Moslem propaganda, while the Turkish irregular armed forces in Asia Minor, retreating beyond the limits set by the Supreme Council to the Greek army of occupation, were developed by Mustafa Kemal Pasha into a Turkish Nationalist movement definitely hostile to the Allies; and after the Supreme Council had announced (Feb. 21) their decision to allow the Sultan to remain in Constantinople, where he would be more amenable to Allied persuasion, the Turkish authorities professed to be unable to control Kemal, who declared his independence and established an Anatolian Government at Angora.

At a further conference at San Remo the Allies completed the draft of the treaty and handed it to the Turkish delegates (May 11), and at the beginning of July at another conference at Spa Venizelos received from the Supreme Council a mandate for the Greek army to restore order in the whole north-western district of Asia Minor, beyond the frontiers of the Smyrna district, as well as in Thrace, where similar disorders had arisen. The Greek army occupied Thrace and entered Adrianople on July 25. "Venizelos expressed the opinion," said Mr. Lloyd George in the House of Commons (July 21), "that he would be able to clear up the whole neighbourhood between Smyrna and the Dardanelles in 15 days. . . . The Greek troops, well organized and admirably led . . . did so in 10 days."

*Treaty of Sèvres.*—The business-like way in which the Greek army carried out this mandate was held to justify the terms of the Treaty of Sèvres, finally signed on Aug. 19, by which the whole of Turkish Thrace from Adrianople up to Chatalja and Derkos, within 20 m. of Constantinople, including Gallipoli and the northern shore of the sea of Marmora (subject to an International Commission which was to control the zone of the Straits), was definitely ceded to Greece; together with the islands of Tenedos and Imbros and all the Aegean islands already in Greek occupation; the Smyrna district with its hinterland was placed under Greek administration, with provision for the exhibition of a nominal symbol of Turkish sovereignty, and subject to the rule of a local parliament, elected by proportional representation, on the demand of which after five years the territory might be definitely incorporated in the Greek kingdom; while Rhodes and the other islands of the Dodecanese were ceded to Italy, but transferred to Greece by a Greco-Italian convention signed on the same day and incorporating the terms of the Venizelos-Tittoni agreement.

After thus concluding his diplomatic labours Venizelos was leaving Paris (Aug. 12 1920) when an attempt to assassinate him was made by two ex-officers of the Greek navy (Tserepes and Kyriakos). The crime was reasonably suspected to have been instigated by King Constantine's propaganda; it was extolled as a glorious tyrannicide by the Royalist press. When the news reached Athens the mob broke loose and looted the houses of many anti-Venizelist politicians, with the connivance of the police, who were also responsible for the brutal murder, after his precautionary arrest, of M. Ion Dragoumes; and although Venizelos telegraphed his horror at the crime he failed, after his return to Athens, publicly to censure the Government for their negligence.

*Fall of Venizelos.*—During his absence from the country Venizelos had left as vice-president of the Council his Minister of the Interior, M. Repoules. With the growing pressure of public affairs, however, Venizelos had become separated from any healthy contact with the community at home. Often, too, he was unfortunate in his choice of administrative subordinates. A mendacious propaganda was kept up by King Constantine's agents that the people were being persecuted and oppressed; and their attempts to stir up seditions and conspiracies made it impossible to relax any of the stringent measures of censorship which gave colour to the tale. Venizelos had attempted in May to repeal some of the provisions of martial law, retaining only those measures strictly necessitated by the state of war in Asia Minor, but had quickly been obliged to revoke the concession. Meanwhile, the country districts suffered even more severely than the towns under the burden of mobilization, from which they had known little release since 1912. When Venizelos returned to Greece, and presented to the Chamber (Sept. 7) the three treaties with Turkey, Bulgaria and Italy, he was, indeed, unanimously thanked as the saviour of his country, and was able to announce that on the imminent dissolution of the Chamber all restrictions of civil liberty would be abolished, so that the elections in the autumn should be held under constitutional conditions. He only made the condition that the return of King Constantine should not become an issue. The opposition, whose strength Venizelos unduly neglected, consisted of a coalition of prominent politicians united only by their hatred of himself. The situation was changed by the death of King Alexander, from the bite of a monkey, on Oct. 25. At a special session (Oct. 28) of the Chamber dissolved on Sept. 23, the Government advised the election as regent of Admi. Kountouriotes and the offer of the crown to Prince Paul, Constantine's third son, whom they regarded as the only constitutional successor. Prince Paul replied that "the Throne does not belong to me; it belongs to my august father King Constantine and constitutionally my eldest brother is his successor. Neither of them has ever renounced his rights. . . . I would only ascend the Throne if the Hellenic people were to decide that it did not want the return of my august father, and were to exclude the Crown Prince George from his right of succession"; and then it became clear that the restoration of Constantine must be the real issue at the general election fixed for Nov. 14. The Opposition jumped at the heaven-sent election cry, while Venizelos was content to announce that if defeated he would retire from public life. The result came as a surprise to both parties. Only 120 Liberals were elected as against 246 members of the Opposition (and four Independents); and although the result failed to represent the real strength of the Venizelists in the country (it was calculated that proportional representation would have returned 200 Venizelists) and they still remained the larger single party in the Chamber, it was impossible to minimize the catastrophic nature of their downfall. Venizelos immediately resigned, and with many of his ministers and officials left the country, and a Government was formed by the aged Demetrius Ralli, which entrusted the regency to the Dowager Queen Olga (who had come to Athens for the funeral).

*Return of Constantine.*—On Dec. 5 a plebiscite was held on the question of the return of King Constantine, from which the Liberals decided to abstain, announcing that they were content loyally to abide by the result of the election. The British, French and Italian Governments issued a proclamation reminding the Greek people that the actions of King Constantine had been hostile to the Allies and "reserving to themselves complete liberty in dealing with the situation" if he were recalled. Nevertheless, 999,954 votes out of 1,013,724 were said to have been cast in favour of the King's return. King Constantine, with his Queen and retainers, returned triumphantly to Athens on Dec. 19 and was received with enthusiasm. The Allied Powers refused, however, to recognise him, and withdrew the financial assistance which Greece had been receiving. The withdrawal of Allied support was serious. Mustafa Kemal's Anatolian movement was still gaining in strength; he had established a Nationalist "Parliament" at Angora which entirely repudiated the Treaty of Sèvres, and had also established communications with Russia; thus vitalized, he was threatening the French occupation in Cilicia and endangering the whole Allied arrangement in the Levant. Accordingly a strong section of Allied opinion, especially in France, seeking a quick and economic settlement, thought that Kemal should be pacified by negotiation and by concessions in Asia Minor; and that the restoration of King Constantine was an excellent pretext for revising the whole treaty (which, though signed, had not been ratified) in Turkey's favour and at the expense of Greece.

Accordingly a conference of the three Powers (England, France and Italy) met in London on Feb. 21 1921, and was attended by two Turkish delegations from Constantinople and Angora, while Greece was represented by M. Kalogeropoulos, who had become prime minister on Feb. 7. The two Turkish delegations coalesced with dignity, the Constantinople delegate retiring to bed and leaving the Turkish case in the hands of the Nationalist delegate from Angora. M. Kalogeropoulos, on the other hand, violently rejected semi-official attempts to persuade him to coöperate in defending the treaty with M. Venizelos, who had come to London in order to plead in his private capacity against the penalization of the Greek people. The Supreme Council first proposed that an Inter-Allied Commission of Inquiry should be sent out to investigate the racial and other problems involved in the questions of Thrace and Smyrna. This proposal having been rejected by Greece, the Conference (March 12) submitted to the delegates its own proposals for modifying the treaty. These, while leaving the Greeks undisturbed in Thrace, strengthened the Turkish position in Constantinople and made certain financial concessions to the Turks; while for Smyrna they proposed a complicated régime of which the principal provisions were the following: the vilayet of Smyrna was to remain under Turkish sovereignty; a Greek garrison would remain in Smyrna, but elsewhere order was to be maintained by a gendarmerie under Allied officers and recruited in proportion to the numbers and distribution of the population in each district as reported by an Inter-Allied Commission; the same proportional arrangement would apply to the administration; and a Christian governor would be appointed by the League of Nations with an elective assembly and council. No definite replies to these proposed modifications of the treaty were received from either party; but on March 24 the Greeks opened an offensive against the Nationalist position, and before the end of the month had seized the important railway junctions of Afiun Kara Hissar and Eskishehr on the line to Angora. North-west of Eskishehr, however, they were heavily defeated (April 2), and after losing 4,000 killed and wounded were compelled to retreat all along the line to their old positions. The reverse was not surprising, as on the eve of the offensive the Government had removed from their commands all the higher officers of Venizelist sentiments and replaced them by Royalists. On April 7 Gounares, who had visited London and Paris during the last days of the Conference, became prime minister. At the same time the centenary of the independence of the Greek kingdom was rather gloomily celebrated (April 7) and was marked by the canonization of the Patriarch Gregory V.

The new Chamber, which had met on Feb. 1 and declared itself a national constituent assembly, was a very representative collection of all the reactionary elements which had been swept out of Greek politics in 1910; indeed, some of the most prominent figures in it had not been heard of since 1897. After voting a large increase in the King's civil list as well as all the arrears of the pension promised him in 1917 it spent most of its time in denouncing such traces as were left of the Venizelist "tyranny," including the introduction into the national schools of the popular or demotic language. M. Gounares had on his programme many ambitious proposals for the revision of the constitution—providing for women's votes; for an industrial council of not more than 200 representatives of legally organized trades to advise the Legislature on social and economic questions and draw up bills for submission to the Government and Chamber; for a plebiscite to be held under certain conditions on the demand of king, Chamber or a fixed number of citizens; for a "service" Government of permanent civil servants, etc., to carry out elections after a dissolution, etc. He was also said to be contemplating decentralization in local government in the direction of provincial (monarchical) autonomy. But at the end of May the National Assembly was still discussing generous proposals for the compensation of all those who had suffered for political reasons since 1917. The Treasury was empty; but the spirits of the populace, who had begun to get uneasy at the continual postponement of the new offensive, the depreciation of the exchange and the rise in the cost of living, were maintained by a mendacious propaganda, one of the favourite legends of which was that England was secretly helping King Constantine in his war against Turkey with supplies of money, and munitions, and even with army and fleet. On May 20 the British, French and Italian High Commissioners in Constantinople proclaimed the strict neutrality during the Greco-Turkish "state of war" of all districts in their military occupation (*i.e.* the "Zone of the Straits"). But some colour was lent to these Athenian rumours at the beginning of June when British relations with the Nationalists of Angora were severely strained; and on June 11 (anniversary of the fall of Constantinople and death of Constantine Palaeologus in 1453) King Constantine left for the Smyrna front amid a frenzy of hysterical flattery, hailed by the Government press as emperor designate of Constantinople and as commander of the Anglo-Greek forces in the Near East.

Soon afterwards the Powers made another attempt to tranquillize Asia Minor before the Greek offensive should open. On June 21 the ministers of the three Powers handed the Greek Government a note in which they offered their "friendly services to prevent the reopening of hostilities in the Near East and to secure an honourable and lasting peace." Four days later the Greek Government, after consultations with the King at Smyrna, replied that Greece, while thanking "her great Allies" for their offer of mediation, could not postpone the offensive as by imposing the terms of the Treaty of Sèvres she was only continuing the task undertaken in conjunction with "her great Allies" during the war, and that the Turkish question could only be solved by force of arms. On June 28 the Greek forces evacuated Nikomeeia (Izmid), and the offensive finally opened on July 19. After a few days the Greek army had again seized Eskishehr and Afiun Kara Hissar as well as Kutahia. A month later they had reached Sivri Hissar, within 60 m. of Angora, but a check came at the end of August, and in September both sides had fought themselves to a standstill.

**GREELY, ADOLPHUS WASHINGTON** (1844– ), American soldier, was born at Newburyport, Mass., March 27 1844. He graduated from the Newburyport high school in 1860 and on the outbreak of the Civil War entered the army as a private, rising to major of volunteers. In 1867 he was appointed second lieutenant in the regular army and the following year became associated with the Signal Service. In 1873 he became first lieutenant. In 1881 he was chosen by President Garfield to establish in Lady Franklin Bay one of the 13 circumpolar stations recommended by the International Geographical Congress held in Hamburg in 1879. Setting out in the summer of 1881 with a party of 25, he penetrated farther north than had any previous explorer, reaching 83° 24′ N. and 42° 45′ W. in 1882. Two relief expeditions failed to reach his party, which returned south to Cape Sabine in dire straits. Only seven were alive when finally rescued in the summer of 1884 by a third expedition under Capt. Winfield Scott Schley. Lt. Greely received medals

from the Royal Geographical Society and the French Geographic Society. In 1886 he was made captain and in 1887 was given an unusual promotion to brigadier-general, being appointed chief signal officer U.S.A. by President Cleveland. From 1898 to 1902 he supervised the construction of telegraph lines in Cuba, Porto Rico and China, and of a very elaborate system in the Philippine Islands. He was likewise in charge of constructing means of communication in Alaska. In 1904 he was made a member of the board to regulate wireless telegraphy in the United States, and the following year appointed to the board to report on coast defences. At the time of the San Francisco earthquake in 1906, as commander of the Pacific Division, he was in charge of relieving the sufferers. In 1908 he was retired by operation of law. In 1911 he represented the United States in London at the coronation of King George V. He wrote *Three Years of Arctic Service* (1886); *Handbook of Arctic Discoveries* (1897) and *Handbook of Alaska* (1909).

**GREGORY, AUGUSTA,** LADY (1852– ), Irish folklorist, playwright and author, was born March 5 1852, the youngest daughter of Dudley Persse of Roxborough, co. Galway. She married in 1881 Sir William Gregory, a well-known Irish M.P. and ex-governor of Ceylon (d. 1892), whose autobiography she afterwards edited in 1894. A prolific writer upon Irish subjects, she produced many plays, essays, volumes of folklore, and popularized versions of ancient sagas and romances concerning the early Irish heroes. She always lived in close *rapport* with the people, and identified herself with their sufferings and aspirations, as in *The Jail Gate*, the *Rising of the Moon*, and other plays. It was she who chiefly popularized the Anglo-Irish dialect of English as spoken in the west, which had been first employed in the *Love Songs of Connacht*. She translated for the Abbey theatre several of Molière's plays into this dialect under the title of *The Kiltartan Molière* (1910). Hence this form of idiom has by some been christened "Kiltartanese" after the name of her district in Galway. She made Cuchulain—the greatest hero of pre-christian Ireland—known to thousands through her re-telling of the ancient tales, which she wove with great restraint and ability into a consistent whole. She did the same for Finn MacCumhail and other heroes of the old sagas. Her work as playwright, and director, in association with W. B. Yeats, of the Abbey theatre, was enormously fruitful. Over a hundred new plays had been produced there by 1921, and scores of actors had been developed and trained. This theatre was opened in 1904, and she told its story in her volume *Our Irish Theatre* (1913). Her only son, a distinguished airman and artist, was killed in the World War; and Sir Hugh Lane, whose life she wrote (1920), was her nephew.

Lady Gregory's chief works are:—*Cuchulain of Muirthemne* (1902); *Poets and Dreamers* (1903); *Gods and Fighting Men* (1904); *A Book of Saints and Wonders* (1907); *Seven Short Plays* (1909); *The Kiltartan History Book* (1909); *The Kiltartan Molière* (1910); *The Image* (1910); *Irish Folk History Plays* (1912); *New Comedies* (1913); *Our Irish Theatre* (1913); *The Kiltartan Wonder Book*; *The Golden Apple* (1916); *The Kiltartan Poetry Book* (1919); *The Dragon* (1920); *Visions and Beliefs in the West of Ireland* (1920); *Hugh Lane's Life and Achievement* (1921).

**GREGORY, ROBERT** (1819–1911), English divine, was born at Nottingham Feb. 9 1819. He was first intended for business, but subsequently went to Corpus Christi College, Oxford, and was ordained in 1843. In 1851 he became curate of Lambeth parish church, and from 1853–73 was rector of St. Mary's, Lambeth, becoming a canon of St. Paul's in 1868. In 1890 he became dean of St. Paul's. A member of the first London School Board, he was a champion of church schools and of religious education. He died in London Aug. 2 1911.

**GRENADES** (*see* 12.578).—The revival of the hand grenade in the Russo-Japanese War of 1904–5 resulted in new designs for weapons of this class being worked out in several countries, not only for hand grenades with a time fuse, but also for percussion grenades and for grenades fired from a rifle. In the World War the advent of trench warfare on the largest possible scale produced a sudden demand for grenades in enormous quantities and as pre-war and war-time designs were successively exposed to the test of active service conditions, while at the same time the needs of quantity production constantly imposed checks of another kind, grenade design passed through a rapid evolution from 1914 up to 1917 after which warfare became more open and the rifle and light machine-gun asserted themselves as the prime infantry weapons. It is proposed here to indicate the course of this evolution by describing representative patterns of grenade employed successively in the British and other armies.

During the course of the war, both hand and rifle grenades (especially the latter) were used as containers for gas and smoke compositions, as well as for illuminating and light-signalling purposes. These special grenades, as grenades, presented fewer problems of design than the explosive grenade, and the safety and ignition devices employed with them were simple adaptations of those used with the explosive grenade. They do not, therefore, require special treatment in the present connexion, and the following account will deal with the explosive grenade only.

*Hand Grenades.*—Perhaps the dominating characteristic of trench warfare as practised in 1914 and 1915 was the inability of the deeply entrenched infantry on each side to inflict damage upon the other otherwise than by high angle fire. Within the infantry arm itself, this high angle fire could at first be provided only by hand grenades. But as no one had foreseen the use of this weapon by infantry on a large scale, the available patterns in Great Britain and elsewhere (designed for use by skilled sappers in siege warfare) were of a somewhat complicated design. Thus, at the outbreak of the World War, the only grenade available in the British service was the "No. 1," evolved after the Russo-Japanese War, and the only immediate means of supplementing it was a stock of "Hale's" grenades which had been manufactured for the Mexican Government. These two, in very small quantities, formed the only armoury of the bomber in the early days of 1915, and soon the troops in the field began to improvise grenades out of jam tins and other receptacles, using any explosive and any form of igniter which was at hand. At the same time other types were worked out by the engineer branch of the War Office, and both then and afterwards countless inventors set to work to produce weapons of this class and submitted them to the military authorities, who sifted them, tested the more promising both on the experimental ground and in the trenches, and finally, where the advantages of a proposed new design outweighed the very serious drawbacks attendant upon manufacturing a new type and training the army to its use—considerations which ruled out many designs that were intrinsically very good—it was adopted as a service store. So far as concerns British grenades, only service stores will be dealt with in this article.

Thus, towards the end of 1915 or the spring of 1916 the types in use and in prospect were very numerous, and most of them were open to objections, either in point of safety to the user, or of trustworthiness in trench conditions, or of manufacture.

Considering them collectively, these grenades may be classified in two ways: according to their effect and according to their method of explosion. As regards the former, a distinction arose between those designed for concussion effect and those designed for fragmentation. From the same dual need of localized effect and of distributed effect which produced the two main classes of artillery shell, came "concussion" grenades which contained a maximum of explosive, contained in the thinnest possible case, and "fragmentation" grenades with heavy iron cases, provided only with the explosive necessary to impart wounding energy to the fragments, and having the iron prepared for the desired fragmentation by criss-cross weakening grooves. Each of these had the defects of its qualities; thus, the concussion grenade was only effective within a narrow radius from the point of burst, and the fragmentation grenade was liable when used in the open to kill the thrower himself with splinters coming back. Examples of each class will be found below, and it should be added that special grenades such as those used for smoke, for light and for gas, were in the intermediate position, having thin walls, so as to contain a maximum of composition and a small explosive charge sufficient merely to open the casing.

The second basis of classification, which from the designer's point of view was the more important, was the method of bursting the charge. In all grenades filled with H.E.[1] as in all shell so filled, a small charge of sensitive explosive is required to detonate the relatively inert main charge. This element is contained in a copper tube called a detonator and it is in the means of igniting this detonator and the safeties provided against its premature action that the whole art of grenade design resides. Many of the risks, indeed, only became evident as the result of active service experience—for instance, the risk that a man would be shot after putting the safety device out of action but before he could throw the grenade.

At the outset, the standard patterns of hand grenade had percussion ignition—that is, they were arranged to explode on contact

[1] Certain German grenades were filled wholly or in part with black powder and needed no detonator.

with the ground or the target. Such grenades were "armed" and dangerous as they lay in the bomber's hand ready for throwing, since, whereas in an artillery shell or a rifle grenade the shock of discharge is available as a force for arming the ignition, in a hand grenade this has to be done by the bomber himself. They were, further, intrinsically more sensitive than artillery fuzes in that they had to act at very low striking velocities and even on soft ground. A very little experience of existing types, therefore, sufficed to turn the current of opinion in favour of time grenades, not because of any special utility and function such as those possessed by the time fuze of artillery but purely because a delay between ignition and explosion was the best practical form of safety. Five seconds was as a rule adopted as a standard interval, and this gave time in case of accident to throw the grenade to a safe distance, or to take cover or lie down. Later, in perfected designs, the percussion grenades came to the fore again, but only towards the end of the war, and these new types were never actually used by the British army in the field.

Apart from the question of safety, the percussion grenade—at least in all patterns previous to those embodying an all-ways fuze—had to be designed so as to fall on its nose. The usual method of ensuring this was by an air-drag in the form of streamers, attached to the tail or handle. Time grenades would of course act whatever the position in which they fell.

With percussion grenades the ignition device was simply armed by, or before, the act of throwing, but in all time grenades of course positive ignition was necessary. Many ignition devices were used and many others proposed; in general, they may be classified as friction lighters and striker-and-cap combinations. In either case, the actual ignition was done by the bomber. In many designs he ignited the grenade before throwing it. In some a cord, attached to his wrist and to the grenade, suddenly tightens when the grenade has travelled to the end of its tether (a few feet) and the parting jerk fires the ignition device. In others, which are the best known and most successful, ignition takes place automatically as (or shortly after) the grenade leaves his hand.

The charge employed in grenades naturally varies according to the intention of the design. In fragmentation grenades, as above mentioned, it is kept small (in the Mills grenade described below it is 2½–3 oz. only, in a total weight of 1 lb. 8 oz.), whereas in concussion grenades—notably in the heavy tin-cased concussion grenades used in the earlier days of the war for wire cutting and demolition effect—it is at a maximum (3 lb. 9 oz. out of a total weight of 5 lb. in the Russian "obstacle" grenade). The permitted weights of hand grenades have also varied considerably. In 1915 heavy grenades intended to be thrown by trench engines (*see* BOMB-THROWERS) were in frequent use, but these were superseded by trench mortar bombs, just as their throwing engines were displaced by light trench mortars. The special grenades used with certain explosive-propellant throwers were also frequently of this heavy class. But for the hand grenade an upper limit was fixed when the ranges required on service and the throwing powers of the average bomber had been ascertained by experience. This limit was about 2 lb. in Germany and 1¼ lb. in Great Britain and France. To qualify as a bomber, a British soldier was required to pitch half of his (1½ lb.) bombs into a trench target measuring 10 ft. longitudinally and 4 ft. laterally at a range of 30 yd., but specially expert men were capable of much longer throws. Another consideration limiting the size of hand grenades was that of ammunition supply in the very difficult conditions of trench fighting.

These two requirements, range and supply in the trenches, combined from 1916 onward to bring into use a much lighter form of grenade, colloquially called the "egg," which weighed only 11–12 oz. and could be thrown 50 yd. by an average bomber. At the same time the grenade of the 1¼ lb. class began to be adapted for firing from a rifle, and thus to take the place of the rifle grenade, though it also remained in use as a hand grenade to the close of the war.

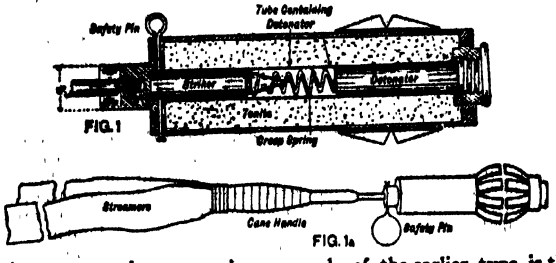

FIG. 1

FIG. 1a

A representative percussion grenade of the earlier type is the British "No. 2" or Mexican Hale (figs. 1 and 1a). Though light (1 lb.) it is of the fragmenting class, for while the casing itself is thin, it is surrounded by a heavy iron collar prepared by grooves for fragmentation. The streamers and the presence of this collar well up on the head ensure a nose-first fall. In the interior is a central tube, the upper portion of which takes the detonator, the middle a creepspring and the lower a pellet with pointed striker. The pellet is held firmly by a safety-pin which is only withdrawn at the last moment. When thrown, the parts retain their relative positions, but on impact inertia causes the striker pellet to fly forward, overcoming the creepspring, and its needle pierces the detonator and the grenade is exploded. It will be noted that, once the safety-pin is removed, the only safety device operating consists of a creepspring which is necessarily kept very weak.

An ingeniously designed French grenade which was much used in 1915, but later shared the fate of all percussion grenades, is shown in figs. 2 and 2a. It is pear-shaped and fragmenting but weighs hardly more than 1 lb. complete. Essentially its ignition arrangements consist in a lever with a weighted cord, a striker and a creepspring. Until the moment before throwing, the lever 7 is held in place by a string, which the bomber breaks with his left hand while firmly gripping the lever with his right. When the grenade is thrown, the lever flies up under the impulse of the spring 9 and the striker 5 is now held off the cap only by the creepspring 6. The lever 7 with the weighted cord 11 act as an air-drag to ensure nose-first impact. The head of the lever 10 is pivoted eccentrically and its underside is formed to a curve which gives an initial leverage against the action of the spring 9, and therefore acts as a safety device.

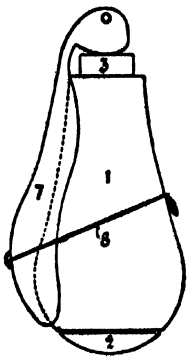

FIG. 2

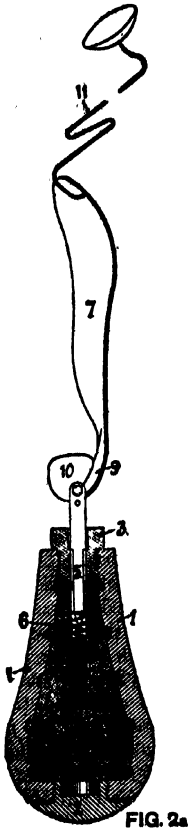

FIG. 2a

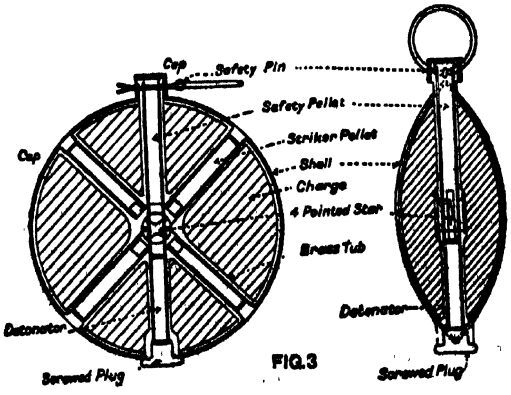

FIG. 3

The German "disc" percussion grenade (fig. 3) is designed so as to act in any position of fall. It has internally six radial channels, of which four are provided with striker pellets carrying caps, one contains the detonator, and the sixth has a safety pellet. In the centre is a fixed star, offering four striker points to the four striker pellets. These points are masked by arms or prongs on the safety pellet until the latter falls out of the grenade during flight and leaves them exposed. Then, whichever portion of the disc edge strikes the ground, the opposite striker pellet sets forward, dashing its cap on to the corresponding point of the star and so firing the detonator. A disc percussion grenade was also used with the Minucciani bombthrower described under BOMBTHROWERS.

It will be noted that in both these cases the ignition arrangements constitute what is called in artillery language a "graze fuze," that is, the active element (the striker pellet) sets forward when the motion of the body of the grenade is checked on impact or graze. In other patterns, on the contrary, the ignition is of the "direct action" class, the pellet projecting from the head of the grenade

and being forced back on to the detonator when the object is struck. To ensure this action, in the case of grenades, the outer end of the pellet is usually formed with a large disc or mushroom head which augments the surface of impact and therefore the resistance which tends to drive in the pellet.

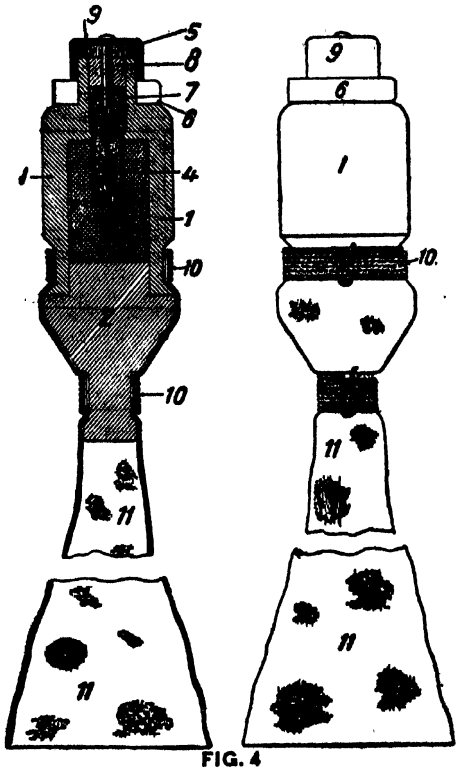

FIG. 4

A simple grenade of this kind is the "Japanese" grenade as employed by the Russian army in the World War (fig. 4). This is a heavy-bodied fragmentation grenade with a hood bound on by cord wrapping instead of streamers. It will be seen from the drawing that when the safety ring 6 is removed nothing holds the striker 5 away from the detonator cap except the tightness of fit of the striker rod in the india-rubber block 8. On impact the mushroom head 9 forces the striker in and the grenade is fired. This was a rather light grenade weighing about 1 lb. 4 oz. and ranged, in expert hands, to about 45 yards. It could not be used in the open, as fragments came back as far as 200 yards. It had no handle, being grasped by the body.

Time grenades, as already explained, possess the advantages of intrinsic safety and of being able to act in any position of fall, though in other respects inferior to percussion. The types described below have been selected (*a*) to show the variety of ignition devices employed and (*b*) to indicate the evolution of design generally during the war period.

The type of grenade shown in figs. 5 and 5a is a Russian pre-war design, based no doubt on Port Arthur experience. The model shown was brought out in 1914 to replace an earlier and heavier engine of similar design.

Between the detonator and the cap is a column of slow-burning composition 21 connected to the cap 19 by strands of quickmatch 25. As in almost all patterns of grenade, the detonator element is transported separately. In this case the parts which render the grenade "live" are assembled in a U-shaped body 18 which is dropped into position with the cap over the striker 6 and the detonator 22 in a cavity in the exploder 23, and clipped there by the fastener 20. The action is as follows: the bomber grips the handle, pressing on the lever 12, and thus by means of the gear *a* cocking the striker-spring 8 and striker 6. His fingers encircle the safety-ring 15 (which has hitherto held the lever) in such a way that in throwing the grenade the ring will remain in his hand. He then withdraws the safety-pin 11 which limits the forward movement of the striker. When he throws the grenade, the spring 14 forces out the lever 12 and the striker 6, released from the gear *a*, flies forward under the influence of its spring and fires the cap. This, through a flash along the quickmatch 25, starts the slow-burning composition which in due course fires the detonator, exploder, and main charge. Though primarily a thin-walled "concussion" grenade, this pattern has the casing lined with metal rings 17 prepared for fragmentation.[1] It will be noticed that the handle portion as well as the body proper is filled with explosive. Carrying nearly 1 lb. of H.E., this was a very formidable concussion grenade, serviceable and not too difficult to manufacture (in spite of its apparent complexity), and could safely be used in fighting in the open.

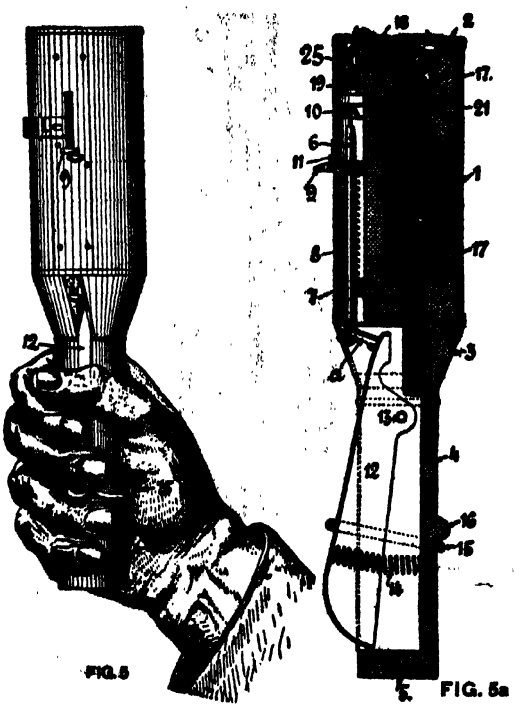

FIG. 5 FIG. 5a

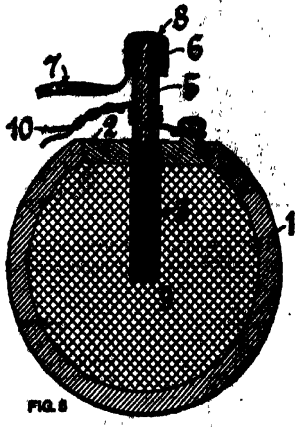

FIG. 6

In marked contrast to this grenade are the more or less improvised time grenades of 1915 of which the British "cricket ball," the French "F1" and some German specimens may be taken as representatives. The British "cricket ball" (fig. 6) and its variant the "lemon" was a plain iron, spherical or ovoid shell into which was screwed a plate carrying a detonator sleeve. In preparing for action the detonator was placed in the sleeve and secured by wire. Crimped into the mouth of the detonator was a 5-seconds length of Bickford safety fuze, the other end of which was prepared with a patch of composition such as is used for safety matches. The protective cap 8 being pulled off, the grenade was ignited by rubbing the head against a strip of matchbox composition (tied on the bomber's sleeve), and thrown. The weight of this grenade in its cricket-ball form was 1¼ lb.

The French "defensive" (*i.e.* fragmenting) grenade "F1" weighed 1¼ lb. As shown in fig. 7 it was ignited by a blow. The cover 10 being removed, a sharp blow on the cardboard inner tube 4 (carrying the cap) forced the cap down on the striker, igniting the time-fuze length 8.

The German 2-lb. ball grenade (fig. 8), unlike most, was powder-filled and, as it could therefore be fired by a flash, needed no sensi-

[1] The earlier (2½-lb.) pattern had a large amount of "langridge" (*i.e.* small pieces of metal) packed round the explosive charge.

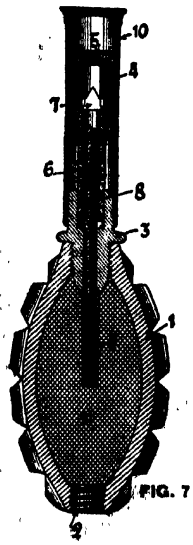

FIG. 7

tive detonator. Its ignition arrangement was somewhat similar to the familiar friction tube of artillery, viz. a roughened bar which was inserted in a tube coated with match composition. A cord

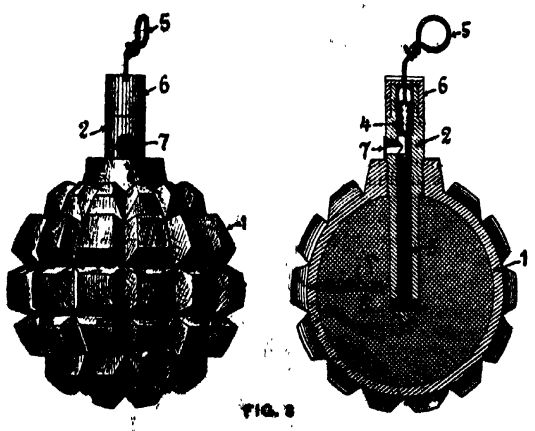

FIG. 8

attached to the bomber's wrist, tightening when the bomb reached the end of its tether, jerked out this roughened bar and so effected ignition.

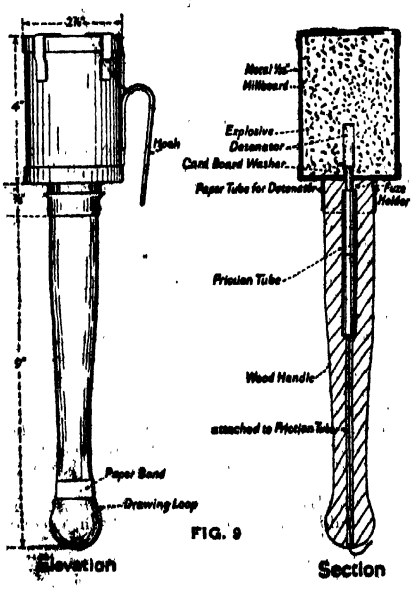

FIG. 9

The German H.E. cylindrical grenade (fig. 9) had also a friction-tube igniter, but the bomber fired this by a pull on the attached wire before throwing. This was essentially a concussion or "offensive" grenade and remained in use throughout the war. It was provided with a handle and with a hook whereby to attach it to the waistbelt. In another type of cylindrical handled grenade, part of the H.E. charge was replaced by langridge [1] and the ignition was by a spring striker as in the "hairbrush" described below.

Another form of handled time grenade used by the Germans and then copied by the British was the "hairbrush." The German

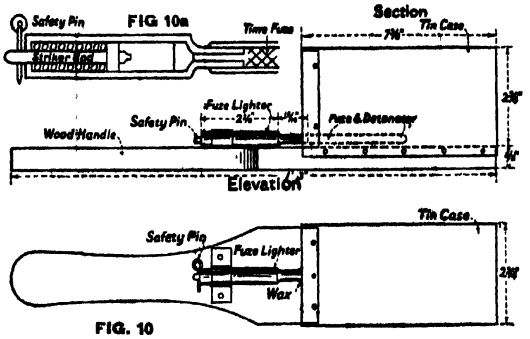

FIG. 10

pattern (figs. 10 and 10a) had a spring igniter of a simple character. In a tube (fig. 10a) inserted in the rear end of the detonator and time-fuze tube was a striker, striker spring and cap. A collar on the striker rod kept the spring in compression so long as the tail end of the rod was held by the safety-pin. As soon as this was withdrawn the spring reasserted itself and the striker flew forward, firing the cap and igniting the time fuze.

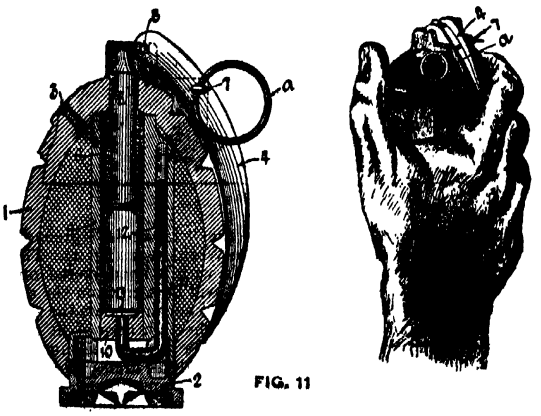

FIG. 11

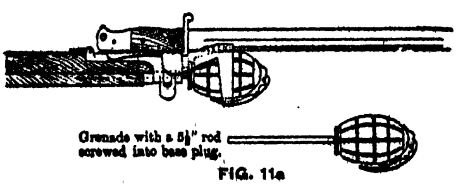

FIG. 11a

Neater in design, more trustworthy in action, and far more popular with the troops than other British types, the *Mills grenade* requires a more extended description (fig. 11). If the number supplied, and the steadiness with which the type maintained its hold on opinion be a test, this grenade was the most important of all those used in the World War.

As its name implies, it was patented by Mr. William Mills, of Birmingham, but the idea was of Belgian origin; although it is fair to add that the original Belgian design differed very considerably from that which is now so familiar as the "Mills" grenade.

The No. 5 grenade, which was the first of several British service patterns of the Mills type, consisted of a barrel-shaped iron casting, fitted internally with an aluminium tube known as the "centre piece." Adjoining the centre tube, and communicating with it at the bottom end of the grenade was a cylindrical chamber for the reception of the detonator to which was attached a 5-second fuze, terminating in a rim-fire percussion cap, which was inserted in the end of the central tube. The lower end of the grenade was closed with a screwed plug, known as the "base plug," made in aluminium,

[1] Some of the grenades improvised in the field by the British army were also partly filled with langridge or so-called "shrapnel."

brass, or a soft alloy, and which secured in position the detonating apparatus, and also formed a firm base to receive the shock of the striker when released from the lever. The high-explosive filling was introduced through an opening situated near the top of the grenade, closed with a brass screw, which, after filling, was carefully cemented into position. The cap was fired by means of a steel plunger, known as the "striker" which was operated by a powerful spring. The striker was held off the plug by means of an external lever provided close to one end, with small trunnions which rested in seatings formed on the head of the grenade. The shorter end of the lever was forked, the prongs of the fork engaging the projecting head of the striker. Thus, while the long end of the lever (which was bent to conform to the outer shape of the grenade) continued to be held in the thrower's hand or to be pinned down by the safety-pin the spring remained compressed and unable to drive the striker down on to the cap, but as soon as the lever was freed, the spring asserted itself, forcing the lever up (and out of its seatings) and the striker fired the cap. Modifications of the No. 5 were made later from time to time with the object of increasing its safety and efficiency, but its main features remained unaltered.

Originally the "Mills" grenade was intended purely and simply as a hand grenade, but it was found that its usefulness could be materially increased if means were adopted for projecting it from a rifle. This idea was considered and ultimately accomplished by substituting for the aluminium base plug one of steel, to the centre of which was attached a short steel rod 5½ in. long. The rod, when inserted in the barrel of a rifle, enabled the grenade to be projected by the firing of a 35 gr. cordite blank cartridge, later replaced by the 43 gr. blank cartridge used for firing all rodded grenades.

In order to hold the lever in its correct position in relation to the grenade, and secure the striker until the moment of discharge from the rifle, a special appliance, known as a "rifle cup," was designed to fit on to the barrel of the rifle, and was secured to the barrel by the bayonet. The rifle cup consisted substantially of a flat steel ring slightly larger in diameter than the grenade, and projecting beyond the barrel of the rifle about 2½ in., the ring being fixed concentrically with the rifle barrel. It will thus be seen that at whatever angle in relation to the horizontal plane, the grenade was inserted in the rifle cup, the lever was prevented from rising and thus releasing the striker until the grenade had been discharged, although the safety-pin had been previously withdrawn, leaving the lever otherwise free to act (fig. 11a).

This device had the effect of increasing the range of the grenade by about 50 yards. In this form the grenade was known by the description of "No. 23 Mark I" and perhaps attained its maximum of usefulness. Later developments of the Mills as a rifle grenade are dealt with below.

The "egg" class of hand grenades, alluded to earlier in this article, embody no novel technical devices and, therefore, need not be further described here. (C. F. A.)

*Rifle Grenades.*—The desire to obtain increased range in a convenient way had already before the World War broke out led to the design of rifle grenades, which were, essentially, percussion grenades fitted with a steel tail-rod that was inserted in the bore of the service rifle and propelled by the force of a blank cartridge. In these rifle grenades, two forces became available to the designer which were not so in the case of hand grenades, viz. high velocity and therefore the possibility of causing and utilizing rotation, and the shock of discharge. Both these forces greatly facilitated the design of percussion grenades, as also did the fact that (given a suitable charge and conditions of firing) the tail rod ensured a nose-first fall. The development of the rodded rifle grenade in the war period was therefore steadier and more consistent than that of hand grenades.

For most of the patterns used by the British army in the war, the original "No. 3" or "Hale's rifle grenade" (fig. 12) may be taken as representative in point of principle. It was a fragmentation grenade, as were all explosive rifle grenades, since the range eliminated danger from blowing back of fragments.

To the lower end of the body was fitted a base-piece of brass, which was bored out to receive a striker-rod and its needle. The outside of this base-piece was machined to receive a wind-vane, the boss of which held in position two safety bolts situated in the base-piece and preventing forward movement of the striker rod. Below the boss of the vane was a sleeve-like safety socket securing the boss above mentioned against premature rotation, so machined and slit that it clipped over the lower portion of the base-piece, this also being suitably machined. Into the lower end of the base-piece was screwed a steel rod, 10 in. long and of the calibre of the rifle, viz. ·303 in. (In this and certain of the patterns which succeeded it a clip was fitted to the base-piece which was sprung over the muzzle of the rifle in order to secure the grenade in position.)

The grenade body itself was traversed by a central tube, in the forward portion of which was secured the detonator in its sleeve, the middle portion containing a creepspring and the lower the point of the striker rod.

When the rifle was fired (a special 43 gr. blank cartridge was used) the safety socket set back, releasing the wind-vane which presently, under the action of the air, began to revolve and so to unscrew itself; in turn, this released the safety bolts which flew out; and thenceforward nothing but a light creepspring kept the detonator off the needle, which flew forward on graze and exploded the detonator and the bursting charge.

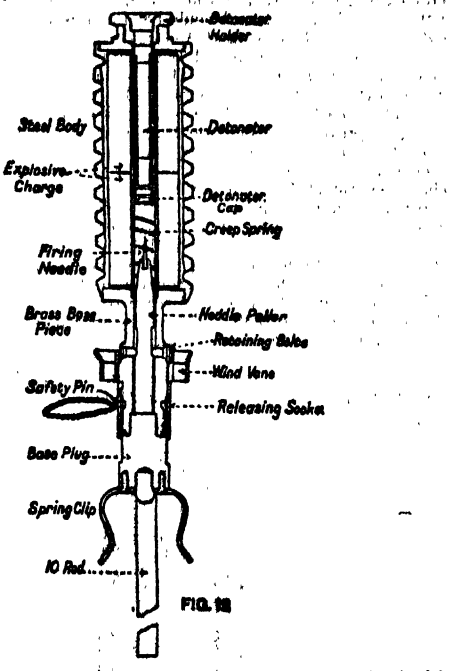

FIG. 12

While the general principle of this grenade was maintained without change, certain defects of detail and other reasons for modification soon appeared. Thus, the difficulty of so much machining in a store which was required urgently and in enormous numbers, and the difficulty of keeping the wind-vane and its screw clean in trench conditions, led to the design of the vaneless "No. 20" in which the safety socket alone controlled the safety bolts, and considerations of manufacture, especially of filling conditions, led to further modifications in the types No. 24 and No. 35. These need not be dealt with in detail here. It should be mentioned, however, that the substitution of a service-rifle cartridge case (with its cap) for special detonator holders brought about a marked improvement in the direction of simplicity of manufacture.

Another British rifle grenade, known as the "Newton Pippin" or No. 22, was an improvised design by Capt. H. Newton, which was manufactured in the workshops of the army in the field. Its ignition arrangements were of the direct-action type, the mushroom-headed striker being forced back on impact. Other features of the grenade were the use of the service cartridge case as a detonator holder (a practice which, as has just been remarked, became general); the length of the rod (15 in.); and the provision of a gas-check on the end of the rod, a device used fairly frequently in other armies but not accepted in regulation British grenades. Ordinarily, the rod of the grenade does not seal the bore of the rifle, as it does not enter the grooves, and a proportion of the propellant force of the gas is therefore lost by escape round the rod. A gas-check, expanding into the grooves and then sealing them, obviates this, though of course the higher efficiency is obtained at the cost of an increased strain on the rifle.

Two other British types of rodded rifle grenade may be mentioned—the Sangster and the Steuart, distinguished by the numbers 25 and 39. In the former, which was of the direct-action class, a wind-vane attached to the striker screwed it down in flight until it left the screw thread and became sensitive. Owing to the careful design of the body and the use of a 15-in. rod, very long ranges were obtained with this grenade, but it was never adopted as a standard pattern owing to the same considerations of difficulty in manufacture and of service rough usage as those which had militated against earlier vaned patterns. The characteristic of the Steuart pattern was a safety device consisting in a sleeve which was slit across in manufacture so as to leave only a narrow web of metal; this sleeve was placed on the striker rod in such a way as to hold it firmly till the shock of discharge occurred, when the rod set back and a shearing blade fixed to it cut through the remaining metal of the sleeve. The striker rod was thus freed. The Steuart was a direct-action grenade. Experience had proved that, in spite of the relatively low velocity of rifle grenades, the conditions of grenade practice were similar to those of artillery in that graze fuzes, having a slight delay inherent in their design, were liable to act only after the projectile had more or less buried itself. It is preferable, therefore, that the ignition arrangements of a rifle

grenade should resemble in principle the artillery "instantaneous" fuze so as to ensure a burst above ground.

In the rodded rifle grenades used by foreign armies, the same general arrangements are, as a rule, found, and a catalogue of the minor variations which are found would be of no interest to the non-technical reader. As France (and America) did not employ rodded rifle grenades at all in the World War, interest centres practically on German and Russian designs. These are not numerous. Both direct-action and graze types are found, and a gas-check is almost invariably fitted to the rod. A tin saucer is sometimes fitted to graze types to prevent the grenade from burying itself in soft ground. Both German types, model 1913 and model 1914, are complicated, especially the latter, which is organized with all the elaboration characteristic of German artillery fuzes of the period. Russian types are usually simpler, and reflect the lessons of active service experience in demanding little or no expertness in the user. Whereas elsewhere it is the almost invariable practice to keep the detonator element separate in transport, and to assemble it in the field, Russian rifle grenades have the detonators (which are rather exploder-gaines than detonators in the British sense of the word) buried in the interior of the body. The usual length of rod was 15½ in., which in a long rifle gives the same length of propellant chamber as a 10-in. rod in the short rifle.

One Russian type, however, merits a full description as it has several unique features. This is the Mgebrov, illustrated in fig. 13.

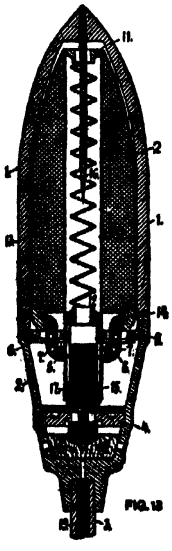

FIG. 13

Against its complexity and evident difficulty of manufacture must be set the positive and "fool-proof" character of its safeties which are such that the bomber is not even called upon to withdraw a safety-pin.

The outer casing 1 is thick (for fragmentation) and inside this outer casing is a separate thin-walled explosive container 2 which is capable of a slight forward movement. The bottom of this container is formed with an incurving lip 14, and it is traversed from end to end by a central tube 13, longer than itself. In this central tube are an extended spring and the pellet containing cap and detonator 12, 15, 17. The spring is attached to the top socket of the tube and to the cap-holder of the pellet. The striker-rod with its needle 16 (which is fixed to the outer shell and not to the container) projects into this central tube. The tendency of the spring therefore is to pull the cap on to the needle. The premature occurrence of this is prevented by two sets of safety devices in which reside, as usual, the ingenuity and the complication of the design.

Under the base of the detonator pellet is formed a detent *a* consisting of a short stem with a barbed end. This end is buried in a block of fusible alloy, which is itself in a cup that is nearly surrounded by thermit 18. The thermit chamber has holes to provide air for combustion and communicates by a channel with the hollow tail-rod 3, which is filled with powder composition 19. All these elements are rigidly attached to the outer case and tail-rod and the detonator pellet is therefore solidly fixed both during transport and when fired. Moreover, the spring in the central tube tends to bind the unattached explosive container to its supporting platform 6, thus avoiding any shock due to set-back on discharge.

On firing, the flash ignites the powder in the tail-rod which burns through to the thermit chamber and ignites the thermit. This instantly develops so high a temperature that the fusible alloy in its cup melts away, freeing the barb of the detent *a* and therefore the detonator pellet. This takes place after four seconds, and the detonator pellet is now gently pulled forward by the spring. Thereupon the second set of safeties comes into play. This consists in two pivoted catches 7, the lower ends of which bear (through slots in the central tube) on the sides of the detonator pellet, and are held there by small springs 8. The pivots of these catches lie in the rigid platform 6 which supports the explosive container, and their upper ends engage in the annular lip 14 formed on its underside.

On graze, the explosive container sets forward, and its under-lip actuates the two catches so that their lower ends no longer bite on the detonator pellet; this latter is then quite free and, under the combined influence of inertia and of its contracting spring, moves violently forward in the central tube, dashes its cap on to the needle and explodes the grenade.

To complete this survey of rodded rifle grenades it remains to mention the British Nos. 44 and 45 anti-tank grenades. These, having often to be fired almost at point blank, had short rods (8 in.) and a calico vane to ensure front contact. Unlike all the types above described, they were designed purely for concussion, having tin bodies and a maximum explosive content. The ignition was of the graze-fuze type. These engines gave a very efficient shattering effect on the hard steel of British tanks and seriously bulged the mild steel of German tanks, besides producing marked shock effects.

(C. E. W. B.; C. F. A.)

*Discharger-Cup Grenades.*—It has already been mentioned that the French army never adopted the rodded rifle grenade. The objections to the rod are indeed serious, quite apart from the fact that it is awkward to handle and requires careful treatment. The rifle tends to bulge and eventually to split in the barrel, especially with the shorter rods, since the propellant gases impinge upon the end of the rod at high velocity and set up wave pressure at the point of contact. This is true, however accurately straight the rods may be. If they are not so, they buckle in the bore and the barrel bursts, probably with fatal results to the firer; in this case it is obviously the longer rod which is the more dangerous. Further, the general strain of firing rodded grenades shakes the rifle to pieces after some time, especially with long-rodded grenades in which heavy recoil is accepted for the sake of obtaining high muzzle velocity and ranging power.

In the latter part of the World War, therefore, we find a general tendency to discard rodded grenades in favour of the discharger-cup or tromblon. In Great Britain this tendency began to show itself after the fitting of the muzzle attachment above described for the Mills grenade. This was not a true discharger-cup since the grenade was rodded and the cup was merely intended to hold down the Mills lever before firing, but its success established the principle that hand and rifle grenades should be as nearly as possible interchangeable, and this requirement was bound in the long run to lead to the discharger-cup in some form.

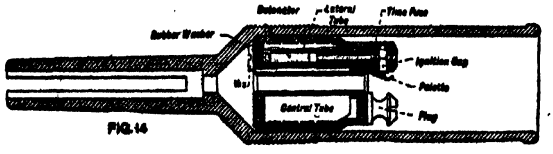

FIG. 14

The pioneers in developing the discharger-cup were the French, whose Viven-Bessières or "V.B." grenade (fig. 14) became as famous in war as the Mills hand grenade. This was a cylindrical fragmentation grenade with a hollow passage through its middle. The ignition arrangement was peculiar. The detonator and time composition were mounted in a tube parallel and adjacent to the central passage, and at the head of this tube, at right angles to its axis, was a small cap-cartridge. A flat spring called the palette, carrying a pointed striker, was mounted in such a way as to protrude into the central passage. The space in the grenade cylinder not taken up by the central passage and the detonator and fuze tube was of course filled with explosive. To the muzzle of the rifle was attached, by a sleeve, the "tromblon" (an old word for blunderbuss) or discharger-cup which was cylindrical for the greater part of its length and coned for the rest. When the grenade was placed in this, the axis of the central passage was in line with the axis of the bore of the rifle. An ordinary bulleted service cartridge was employed.

When the rifle was fired, the bullet, on leaving the muzzle, passed through the central passage of the grenade giving a sharp inward blow to the palette and thus firing the cap. At the same time the expanding gases from the bore filled the conical space in the cup and propelled the grenade.

This combination of cup and grenade proved very serviceable, its chief defect being shortness of range (180 metres) as compared with the rodded grenade. For longer ranges a different discharger was employed known as the D.R. In this, the cup (called a "mandrin") was externally cylindrical and internally coned (fig. 15), and the grenade had a sleeve with external vanes (*cf.* the grenades of the German *Granatwerfer* described under BOMBTHROWERS. A blank cartridge was employed. The sleeve of the grenade was slid over the outside of the cup as far down as the regulating pin allowed it to go, the function of this pin being to regulate the volume of the gas expansion chamber and therefore the range. The body of the

grenade was arranged for fragmentation and it had a direct-action ignition system. The maximum range was nearly 400 yards.

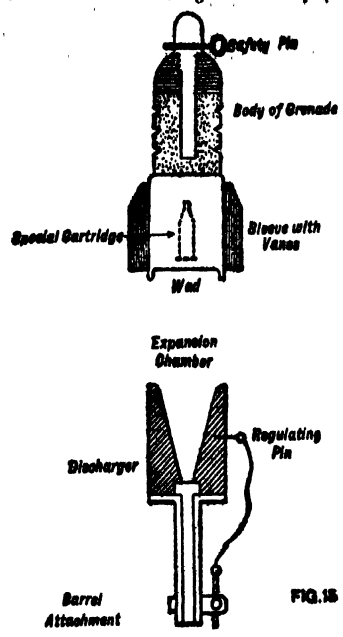

FIG. 15

The German discharger-cup grenade, introduced in 1918 to replace rodded grenades, was in all but details a copy of the French V.B. It ranged to 150 metres. The ignition arrangement was simpler than in the French archetype.

The Russians also used a discharger-cup grenade in addition to their rodded rifle grenades. The grenade for this fuze had an adjustable time ring. (C. F.-A.)

*The Grenade of the Future.*—In Great Britain, a reconsideration of grenade problems in the middle of 1917 led to several modifications in the Mills grenade as such (the new pattern being designated No. 36) and in particular to the design of a discharger-cup for it. The rod was abandoned, and replaced by a steel disc 2¼ in. in diameter attached to the base plug. This fitted accurately into the cylindrical portion of the cup, and the whole of the escaping propellant gas was therefore usefully employed. This cup was used on active service in the last months of the war.

Meantime, research had again been directed to the percussion hand grenade. Various types had been tried but, owing chiefly to the fact that the Mills had become thoroughly familiar and was trusted by the army, none was actually adopted.

The fusion of hand and rifle grenades, however, was not imminent, and amongst the conditions laid down for the "grenade of the future" were that it was to be (1) a percussion grenade, but one that would act in any position of impact or fall without the necessity of any form of air-drag; (2) capable of use either as a hand grenade or as a rifle grenade; (3) safe (*a*) during the first 10 yd. of flight and (*b*) if dropped or accidentally knocked prior to throwing, but sensitive beyond 10 yd., even should it fall in soft mud; capable also of being picked up and thrown away when lying on the ground with all safeties removed; (4) weatherproof and mudproof; (5) simple to manufacture, to assemble in the field, and to use.

The last two conditions are obvious necessities in a service grenade required in vast quantities. The other three, however, involve technical questions of design and are largely interdependent. Thus, requirement (1) might be met by rotating the grenade by grooves in the discharger-cup and ridges on the grenade or *vice versa* (thus ensuring nose-first impact) were it not for requirement (2), and in requirement (3) the significance to the designer of the 10-yd. frontier between "safe" and "sensitive" is different according as a hand-throw or an explosive propulsion is in prospect. A discussion of these requirements in detail, the technical elements available for meeting them, and the experimental patterns which have been evolved in accordance with this schedule of conditions lies outside the scope of this article. It must suffice to say that the problem thus set is one of great difficulty, but that, with the harvest of experience gained in grenade design during the war period, it is by no means insoluble. One or two questions of a general character should, however, be mentioned in conclusion.

The range and weight of the grenade of the future will depend undoubtedly on the final interpretation of the lessons of the war. The tendency to increase range will be checked at some upper limit fixed by the capacity of the infantryman's standard weapon to endure the strain. Beyond that limit a special weapon will be required, and this will either compete with or fuse with the light trench mortar, but in either case its projectile will cease to be a grenade in the ordinary acceptation of the term. On the other hand the lower limit of weight of projectile remains fixed by the necessity of producing adequate effect on explosion. Under existing conditions it may be stated, as a *rough* indication, that the lower limit of weight compatible with effect is hardly, if at all, below 1 lb., and that 300–350 yd. represents the upper limit of weight for 1¼–1½ lb. bombs fired from a discharger-cup fitted to the ordinary rifle.

Another question of importance is the means used for varying the range. As a hand-thrown weapon of course the grenade is brought on to its target by the skilled eye and hand of the thrower, but as a rifle grenade it requires mechanical adjustment. During the war, special rifle-grenade stands were designed, into which the rifle was clamped, but such devices may be considered as proper to trench warfare only, and the problem of the present day is to find a means of varying the trajectory of the grenade which is adaptable to the individual rifle. Two solutions have offered themselves. One is varying the pressure of the propellant gas by varying the position of the grenade in the cup, as in the French D.R. grenade and mandrin, the discharger-cup used in the last months of the war for the Mills grenade, and other types. Opinion is divided on the merits of this method, which, though attractive in other respects, is open to criticism because it does not legislate for wind—a specially important factor in shooting with a large object of low velocity such as the grenade, and also because such an adjustment may easily be forgotten or mis-set in battle conditions. The alternative is to provide a simple form of clinometer or elevation indicator on the rifle. (C. E. W. B.)

**GRETNA** (*see* 12.583*).—A new association was given to the village of Gretna in 1915, when the Ministry of Munitions purchased a site for the erection of a large propellants factory and for houses to accommodate munition workers. The strip of land taken for the purpose was roughly 9 m. long by 1 m. broad, and extended from the village of Dornock on the west to Longtown on the east. The factory was erected to make the explosive known as cordite R.D.B., which had been recently invented by the Research Department and was made without the use of acetone, of which supplies were short.

An area of 7,715 ac. of lightly farmed arable and pasture land was taken under the Defence of the Realm Act in July 1915, and was subsequently increased by 1,399 additional ac. in order that the factory might convert into cordite both its own nitro-cellulose and also that produced by a factory at Queensferry. One factory was divided into separate areas for the successive processes of manufacture, and materials were carried by an elaborate system of specially constructed railway lines. The full output of 800 tons of cordite per week was attained in the beginning of 1917, and the total amount of cordite produced was 56,876 tons. The maximum number of construction and operating workers employed together was 24,700, but the number of operating workers had been reduced by the date of the Armistice from 20,000 to 11,000. The proportion of female to male labour was about seven to three. For the accommodation of this large staff, factory townships were erected; the two largest of these were Gretna, with an area of 431 ac., and Eastriggs, near Dornock, with an area of 173 ac. The total number of dwellings erected included 670 timber huts, 54 timber hostels, 310 brick or stone houses, and 134 brick hostels, accommodation being provided for 13,485 persons. The villages contained shops, halls, cinemas, recreation grounds, schools and churches, and excellent supplies of water (from the river Esk) and of electric power were provided, both for industrial and for domestic use. Surplus land was cultivated and provided large supplies of oats, potatoes, garden produce and hay. The townships were administered by a town manager who controlled housing and public services, and the factory was made a special police area. The health of the factory was very satisfactory; the total number of deaths was 145. When the factory was gradually closed down after the Armistice many of the workers were allowed to remain in the houses, though they had to find employment elsewhere or in the repair of railway wagons, which was introduced to relieve unemployment in the area. At the end of 1920 there were still some 600 operatives employed in the maintenance of the buildings or in some other work connected with the factory; but, after considerable hesitation, it was decided not to retain it for national purposes and it was offered for sale in the autumn of 1921.

**GREY, ALBERT HENRY GEORGE GREY, 4TH EARL** (1851–1917), British statesman, was the son of Gen. Charles Grey, Queen Victoria's private secretary, and grandson of the 2nd Earl, the Whig Prime Minister who passed the Reform bill of 1832. Born Nov. 20 1851, he was educated at Harrow and at Trinity College, Cambridge, where he graduated with a first-class in the law and history tripos, 1873. As his uncle the 3rd Earl had no children, Albert Grey was the heir-presumptive to the earldom, and he endeavoured to win a seat in Parliament as a Liberal, when a by-election occurred in S. Northumberland in

**These figures indicate the volume and page number of the previous article.*

grenade should resemble in principle the artillery "instantaneous" fuze so as to ensure a burst above ground.

In the rodded rifle grenades used by foreign armies, the same general arrangements are, as a rule, found, and a catalogue of the minor variations which are found would be of no interest to the non-technical reader. As France (and America) did not employ rodded rifle grenades at all in the World War, interest centres practically on German and Russian designs. These are not numerous. Both direct-action and graze types are found, and a gas-check is almost invariably fitted to the rod. A tin saucer is sometimes fitted to graze types to prevent the grenade from burying itself in soft ground. Both German types, model 1913 and model 1914, are complicated, especially the latter, which is organized with all the elaboration characteristic of German artillery fuzes of the period. Russian types are usually simpler, and reflect the lessons of active service experience in demanding little or no expertness in the user. Whereas elsewhere it is the almost invariable practice to keep the detonator element separate in transport, and to assemble it in the field, Russian rifle grenades have the detonators (which are rather exploder-gaines than detonators in the British sense of the word) buried in the interior of the body. The usual length of rod was 15½ in., which in a long rifle gives the same length of propellant chamber as a 10-in. rod in the short rifle.

One Russian type, however, merits a full description as it has several unique features. This is the Mgebrov, illustrated in fig. 13.

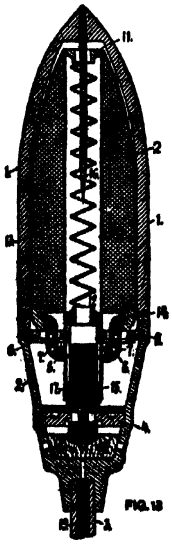

FIG. 13

Against its complexity and evident difficulty of manufacture must be set the positive and "fool-proof" character of its safeties which are such that the bomber is not even called upon to withdraw a safety-pin.

The outer casing 1 is thick (for fragmentation) and inside this outer casing is a separate thin-walled explosive container 2 which is capable of a slight forward movement. The bottom of this container is formed with an incurving lip 14, and it is traversed from end to end by a central tube 13, longer than itself. In this central tube are an extended spring and the pellet containing cap and detonator 12, 15, 17. The spring is attached to the top socket of the tube and to the cap-holder of the pellet. The striker-rod with its needle 16 (which is fixed to the outer shell and not to the container) projects into this central tube. The tendency of the spring therefore is to pull the cap on to the needle. The premature occurrence of this is prevented by two sets of safety devices in which reside, as usual, the ingenuity and the complication of the design.

Under the base of the detonator pellet is formed a detent *a* consisting of a short stem with a barbed end. This end is buried in a block of fusible alloy, which is itself in a cup that is nearly surrounded by thermit 18. The thermit chamber has holes to provide air for combustion and communicates by a channel with the hollow tail-rod 3, which is filled with powder composition 19. All these elements are rigidly attached to the outer case and tail-rod and the detonator pellet is therefore solidly fixed both during transport and when fired. Moreover, the spring in the central tube tends to bind the unattached explosive container to its supporting platform 6, thus avoiding any shock due to set-back on discharge.

On firing, the flash ignites the powder in the tail-rod which burns through to the thermit chamber and ignites the thermit. This instantly develops so high a temperature that the fusible alloy in its cup melts away, freeing the barb of the detent *a* and therefore the detonator pellet. This takes place after four seconds, and the detonator pellet is now gently pulled forward by the spring. Thereupon the second set of safeties comes into play. This consists in two pivoted catches 7, the lower ends of which bear (through slots in the central tube) on the sides of the detonator pellet, and are held there by small springs 8. The pivots of these catches lie in the rigid platform 6 which supports the explosive container, and their upper ends engage in the annular lip 14 formed on its underside.

On graze, the explosive container sets forward, and its under-lip actuates the two catches so that their lower ends no longer bite on the detonator pellet; this latter is then quite free and, under the combined influence of inertia and of its contracting spring, moves violently forward in the central tube, dashes its cap on to the needle and explodes the grenade.

To complete this survey of rodded rifle grenades it remains to mention the British Nos. 44 and 45 anti-tank grenades. These, having often to be fired almost at point blank, had short rods (8 in.) and a calico vane to ensure front contact. Unlike all the types above described, they were designed purely for concussion, having tin bodies and a maximum explosive content. The ignition was of the graze-fuze type. These engines gave a very efficient shattering effect on the hard steel of British tanks and seriously bulged the mild steel of German tanks, besides producing marked shock effects.

*Discharger-Cup Grenades.*—It has already been mentioned that the French army never adopted the rodded rifle grenade. The objections to the rod are indeed serious, quite apart from the fact that it is awkward to handle and requires careful treatment. The rifle tends to bulge and eventually to split in the barrel, especially with the shorter rods, since the propellant gases impinge upon the end of the rod at high velocity and set up wave pressure at the point of contact. This is true, however accurately straight the rods may be. If they are not so, they buckle in the bore and the barrel bursts, probably with fatal results to the firer; in this case it is obviously the longer rod which is the more dangerous. Further, the general strain of firing rodded grenades shakes the rifle to pieces after some time, especially with long-rodded grenades in which heavy recoil is accepted for the sake of obtaining high muzzle velocity and ranging power.

In the latter part of the World War, therefore, we find a general tendency to discard rodded grenades in favour of the discharger-cup or tromblon. In Great Britain this tendency began to show itself after the fitting of the muzzle attachment above described for the Mills grenade. This was not a true discharger-cup since the grenade was rodded and the cup was merely intended to hold down the Mills lever before firing, but its success established the principle that hand and rifle grenades should be as nearly as possible interchangeable, and this requirement was bound in the long run to lead to the discharger-cup in some form.

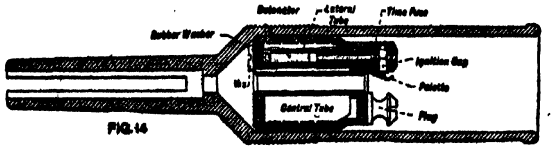

FIG. 14

The pioneers in developing the discharger-cup were the French, whose Viven-Bessières or "V.B." grenade (fig. 14) became as famous in war as the Mills hand grenade. This was a cylindrical fragmentation grenade with a hollow passage through its middle. The ignition arrangement was peculiar. The detonator and time composition were mounted in a tube parallel and adjacent to the central passage, and at the head of this tube, at right angles to its axis, was a small cap-cartridge. A flat spring called the palette, carrying a pointed striker, was mounted in such a way as to protrude into the central passage. The space in the grenade cylinder not taken up by the central passage and the detonator and fuze tube was of course filled with explosive. To the muzzle of the rifle was attached, by a sleeve, the "tromblon" (an old word for blunderbuss) or discharger-cup which was cylindrical for the greater part of its length and coned for the rest. When the grenade was placed in this, the axis of the central passage was in line with the axis of the bore of the rifle. An ordinary bulleted service cartridge was employed.

When the rifle was fired, the bullet, on leaving the muzzle, passed through the central passage of the grenade giving a sharp inward blow to the palette and thus firing the cap. At the same time the expanding gases from the bore filled the conical space in the cup and propelled the grenade.

This combination of cup and grenade proved very serviceable, its chief defect being shortness of range (180 metres) as compared with the rodded grenade. For longer ranges a different discharger was employed known as the D.R. In this, the cup (called a "mandrin") was externally cylindrical and internally coned (fig. 15), and the grenade had a sleeve with external vanes (*cf.* the grenades of the German *Granatwerfer* described under BOMBTHROWERS. A blank cartridge was employed. The sleeve of the grenade was slid over the outside of the cup as far down as the regulating pin allowed it to go, the function of this pin being to regulate the volume of the gas expansion chamber and therefore the range. The body of the

than the rest of the western world, welcomed as a most beneficent change. Then, in October, came, almost simultaneously, the assertion by Prince Ferdinand of the independence of Bulgaria and his assumption of the title of king or tsar, and the annexation by Austria-Hungary of Bosnia and Herzegovina, which she had administered under the Treaty of Berlin. These strokes of policy moved the indignation of both the Russian people and the Russian Government; but the German Emperor announced that he would stand by his Austrian ally in "shining armour"; and Sir E. Grey, though he protested against the infraction of the public law of Europe, was naturally unable to promise Russia anything more than diplomatic support. The action of the Central Powers must have confirmed him in the view that it was from them that came the principal danger to European peace; but he kept on friendly terms with them, and resisted all suggestions that the Anglo-French Entente and the Anglo-Russian agreement constituted in any sense a hostile encirclement of Germany. On the other hand he emphatically declared in Parliament that, if Germany persisted in her naval preparations, Britain could not give up the competition.

The labours of the Foreign Office, coupled with membership of the House of Commons, left Sir Edward little leisure for forwarding the domestic policy of the Government. But he made two or three speeches in 1909 on behalf of Mr. Lloyd George's famous budget, maintaining that it was not revolution that Britain had to dread, but undue slowness to move with the times. He also took his share in the campaign against the House of Lords, but protested that he was in favour of a two-chamber system, with the Commons predominant, and declared the Parliament Act, after its passing, to be a cumbrous and not a final measure. He showed himself a convinced supporter of Irish Home Rule, but was forward in the autumn of 1913 to obtain an agreed settlement, suggesting "Home Rule within Home Rule" as the proper method of meeting Ulster's fears. He was a strong advocate of woman suffrage; and he defended the Declaration of London as conforming the British naval code to that which the United States and the continent of Europe would agree to enforce in war.

Meanwhile British relations with Germany were his main preoccupation. Germany gave dramatic notice of her dissatisfaction with the spread of French arms and influence in Morocco by despatching, at the beginning of July 1911, the gunboat "Panther" to the N.W. African coast at Agadir, to protect, it was alleged, German interests (a step which perhaps hastened the action of Italy, later in the year, in seizing Tripoli before her German ally could develop an interest in it). In view of this further attempt to test, and if possible loosen, the Entente, the British Foreign Office issued a warning, through the mouth of Mr. Lloyd George speaking at the Mansion House, that Britain intended at all hazards to maintain her place among the Great Powers. The warning sufficed to make Germany lower her tone, and Sir E. Grey helped forward a reasonable agreement between her and France. In November he explained to Parliament that the foreign policy of the Government was a continuance of Lord Lansdowne's, and had got rid of the constant trouble with France and Russia; that British friendship with these Powers afforded a guarantee that neither would pursue an aggressive or provocative policy towards Germany, while the strength of Germany was a guarantee that no country would pick a quarrel with her; but that, when a nation had the biggest army and was increasing its already big navy, it was natural that other Powers should be apprehensive. On this occasion, as always, the Opposition, represented now by Mr. Bonar Law, supported Sir Edward; but many Radicals and Labour men, as throughout his tenure of office, were full of suspicions, disliking any agreement with autocratically governed Russia, and anxious for better relations with Germany at almost any cost. But public opinion in general supported Sir Edward, and was pleased when in the following year his memorable services to his country as Foreign Minister in difficult times were marked by the very unusual distinction, for a commoner, of the Order of the Garter.

In the beginning of 1912 he was a party to sending Lord Haldane on an informal mission to Berlin to reassure the Emperor and his Government as to the pacific intentions of Britain and to probe the intentions of Germany. The Cabinet formally notified the German Government that Britain would neither make, nor join in, any unprovoked attack on Germany. But nothing would content the German Government but an absolute pledge by Britain of neutrality if Germany were engaged in war—a pledge which Sir E. Grey naturally could not give. Largely in consequence of this ominous rebuff, he exchanged letters on Nov. 22 1912 with the French ambassador, agreeing that, if either Britain or France had grave reason to expect an attack by a third Power or a menace to the general peace, both Governments would consult whether they should coöperate and what measures they should take in common. Still he found himself able to work in general harmony with the German Government in the efforts made by the Powers, in conference in London, to bring a settled peace to the Balkans. In those regions, in the years 1912 and 1913, a Balkan League of Bulgaria, Serbia and Greece had, first of all, severely defeated Turkey, and had then split up, Bulgaria's treachery in turning on Serbia and Greece, in order to obtain the largest share of the booty, being overcome, after barbarous fighting on the part of Bulgarians, Serbians and Greeks alike, by the final intervention of Rumania. He joined the other Powers in creating an independent Albania, under a German prince; and seems to have had his suspicions lulled for the time by the apparent reasonableness of German diplomacy and by the straightforward attitude of the new German ambassador in London, Prince Lichnowsky, who was not, it subsequently appeared, in the confidence of his own Government.

Accordingly he was taken aback by the unyielding attitude of Germany in the negotiations arising out of the Austro-Serbian dispute. As soon as he heard of the Austrian ultimatum delivered at Belgrade on July 23 1914, he realized at once that Russia could not allow Serbia to be crushed, and exerted himself in the most strenuous fashion to save Europe from the threatened catastrophe of a war in which four Great Powers at least, Austria, Russia, Germany and France, would be involved. In conjunction with Russia he urged upon Austria the extension of the alarmingly short time-limit of 48 hours, and he pleaded unavailingly with Germany to do the same. Next he proposed that England, France, Germany and Italy should work together at Vienna and St. Petersburg for conciliation—a proposal to which Germany had no objection, but which produced no result. Thirdly, in conjunction with France and Russia, he advised Serbia to go as far as possible to meet Austria; and in fact, Serbia accepted almost the whole of the Austrian demands; but Austria would be content with nothing less than complete submission, and on the expiry of the time-limit declared war on Serbia. Sir Edward proposed a conference in London between himself and the French, German and Italian ambassadors, to discuss the best means of a settlement. Germany boggled at the conference, but accepted in principle mediation between Austria and Russia by the four Powers; and he asked her to suggest any other form of mediation than the proposed conference. At this point, on July 29, Germany, declaring war to be inevitable if Russia attacked Austria, endeavoured to purchase the neutrality of England by undertaking, if England remained neutral, to make no territorial acquisitions at the expense of France—an undertaking which did not extend to the French colonies—and by promising to respect Belgian integrity, after the war, if Belgium had not sided against Germany. Sir E. Grey next day absolutely refused to make any bargain of the sort at the expense of France and Belgium. But, in a final effort for peace, he offered, if through the coöperation of Germany with England the peace of Europe should be preserved, to endeavour to promote some arrangement, to which Germany would be a party, by which she and her allies could be assured against any aggression or hostile policy on the part of France, Russia or Great Britain. This suggestion met with no response. In view of the apparent threat to Belgium, Sir Edward asked France and Germany whether they were prepared to respect Belgian neutrality provided it was not violated, and he asked

Belgium whether she would remain neutral. France and Belgium both replied affirmatively, while Germany temporized. Hopeful negotiations which had been begun directly between Russia and Austria were wrecked by a German ultimatum to Russia to countermand her mobilization; and on Saturday Aug. 1 Germany declared war on France.

The moment for decision had come for Great Britain. Russia had asked her to declare herself against Germany and so give the German General Staff pause; France had asked her to co-operate, as Germany was about to invade French territory. The Cabinet had hitherto been divided, a strong section pressing for the preservation of neutrality, and so Sir Edward had been unable to reply favourably to either Russia or France. But now Germany had declared war on France, and was apparently about to disregard the neutrality of Belgium. The Opposition, through Mr. Bonar Law, tendered support for active measures to aid France and Russia; and Sir Edward with a Cabinet rallying, with slight exceptions, to his view, was able to make an appeal in the House of Commons on Aug. 3 for the support of public and parliamentary opinion to a policy of action. Unconditional neutrality, he said, was precluded by the commitment to France and the consideration of Belgium. The forces of the Crown were never more efficient; the Government had striven for peace till the last moment; and the country when it realized the situation would support them. The speech finally decided a wavering public opinion; with the exception of some Radicals and extremist Labour men, all parties, including the Irish Nationalists, accepted the necessity of war. Sir Edward demanded next day that Germany should respect the neutrality of Belgium, and on the German refusal, England went to war.

Great Britain found herself at once associated, in the war against the Central Powers, with France, Russia, Belgium and Serbia, to whom Japan, in virtue of her relations to Great Britain, was added in the course of August. One of Sir Edward's first tasks was to turn this association into an alliance, which should bind its members to fight in common and make peace in common. In the course of the negotiations for this purpose, both with the Powers who were fighting Germany from the beginning and with those who, like Italy and smaller Powers, joined afterwards in the struggle, he did not hesitate to guarantee the support of Great Britain for the attainment of long-cherished national objects, provided that these did not conflict with the aims of liberation and self-development common to the Allies—the most striking case being the promise, after Turkey entered the war on the side of the Central Powers, that Russia should have Constantinople.

Much of Sir Edward's time and attention during the first half of the war was occupied by difficult questions arising out of the blockade of Germany and the consequent interference with the trade of neutrals. Public opinion in Great Britain constantly complained that the blockade was not enforced with sufficient strictness, that the policy enunciated of preventing goods from either entering or leaving Germany was very far from being realized in fact; while the United States, as the principal neutral, harassed the British Government by repeated notes, denouncing the methods of the British navy, in the search of neutral ships and in the seizure of goods, as unnecessarily prejudicial to American trade and contrary to international law. He was perhaps more successful in his answers to the Americans than in his justification to the British public; and a large body of opinion in America accepted his explanations as reasonable. He pointed out, as was indeed notorious, that American exports to neutral countries adjacent to Germany had enormously increased since the war began; that there was a serious danger lest these countries might become in consequence bases of supplies and arsenals for the enemy on an unprecedented scale; that there were neutral ports in the neighbourhood of Germany that were neutral only in name and really did a thriving trade in contraband; and that Britain was only exercising the right claimed by the United States in their Civil War of expanding the practices of international law to meet emergencies not hitherto contemplated. He further demonstrated that the assertion of the United States that the immense modern ships could be adequately searched at sea, at a period when submarine warfare was being vigorously prosecuted, and that it was unjustifiable to take them into port for the purpose, could not be seriously maintained. He claimed also that the British practice caused the least discomfort to neutrals; and contrasted with it the German practice of sinking ships, regardless of human life.

The tenure of the Foreign Office by a statesman so high-minded, sincere and experienced as Sir Edward Grey was everywhere regarded as such a valuable asset for Great Britain that it appeared only natural and fitting for Mr. Asquith, when contemplating the formation of a Coalition Government in May 1915, to lay down, as one of the essential conditions, that there should be no change in the office of Foreign Secretary. No one could refute with such authority the intermittent assertions of the German Chancellor that it was England and not Germany that was responsible both for the origin and for the continuance of the war. Sir Edward pointed out, in a letter to the press on Aug. 25 1915, that the reason why the Anglo-German negotiations of 1912 broke down was that Germany wished to retain her freedom to wage war while binding Britain to absolute neutrality. What she was really fighting for now was supremacy and tribute. When the pacifists called for negotiations in May 1916, he showed that when the Germans professed a readiness for peace it was only for a peace on the basis that Germany had won and the Allies were beaten; but the Allies were not beaten, and the first step towards peace would be taken when Germany began to recognize that fact. In Oct. 1916 he laid it down that, as the war was forced by Germany on Europe, it was the Allies who must have guarantees for the future. The peace must ensure that Europe should be free from Prussian militarism.

Credit must be given to Sir Edward for facilitating, in the early summer of 1915, the entry of Italy—till May 3 a member of the Triple Alliance—into the war against the Central Powers. It was, however, a grave disappointment to him that he was unable to prevent Bulgaria, in the autumn of 1915, from taking the field against the Allies. He had worked for a Balkan agreement founded on mutual concessions, but naturally Greece and Serbia would not make concessions unless Bulgaria joined the Allies; and Bulgaria was seduced by the promise of the Central Powers, who had not to consider the feelings of her neighbours. He warned Bulgaria that, if she joined the enemy, Britain would give her own friends in the Balkans all the support in her power in conjunction with her Allies, without reserve and without qualification. In fulfilment of this promise Allied troops were sent to Salonika, and he offered Cyprus to Greece in order to induce her to carry out her treaty obligations and go to Serbia's aid against Bulgaria. But on this issue King Constantine won the support of his people against M. Venizelos; and Serbia was crushed before help could reach her.

Sir Edward made strenuous efforts, with a certain measure of success, on behalf of British prisoners in Germany and British civilians interned at Ruhleben. The course of the war compelled him, in July 1916, after long hesitation, to abandon that Declaration of London in regard to naval warfare which he had strongly supported in peace-time. He took part, it may be added, in the first tentative experiments to obtain full coöperation of all the Allies in war, by attending Allied Conferences in Paris in Nov. 1915 and March 1916.

In July 1916 an affection of the eyes, which had been giving him increasing trouble, made it advisable that he should have as much relief from work as possible, and he accepted a peerage. It was announced that he had been created an earl—a rank which his public services thoroughly warranted. But he wished to keep his own name, and yet not to enter into any competition with the head of his family, his cousin Earl Grey. Accordingly at his own request he was gazetted a viscount and not an earl—Viscount Grey of Fallodon. When a few months later, in December, his friend and chief Mr. Asquith was succeeded in the premiership by Mr. Lloyd George, failing eyesight and political comradeship both united to determine him to bring his tenure of the Foreign Office to a close. He had served for a longer con-

secutive period than any predecessor, exceeding by a year the 10 years' tenure of Grenville (1791–1801), Pitt's colleague in the first war against republican France, and of Castlereagh (1812–22), the Foreign Secretary under whom Waterloo was won and the Treaty of Vienna signed. In his official methods he carried out his own precept—that foreign policy required not striking effects nor bold strokes but careful steering. An ardent lover of peace, he had been driven, through no fault of his, to lead Great Britain into the World War; he left a tradition in his office of steady work, a resolute will, and a clear head, and of that straightforwardness, sportsmanship, and courtesy which distinguish the best type of English gentleman.

After his resignation Viscount Grey took no part in public life for more than a couple of years. Happily, rest and quiet worked a decided improvement in his eyesight, and in the autumn of 1919 he felt himself well enough to comply with the wish of Mr. Lloyd George's Government that, pending the appointment of a permanent ambassador after Sir Cecil Spring-Rice's premature death, he should go on a mission to Washington to deal with questions arising out of the peace. He only remained there three months; while his sympathetic personality made numerous friends for himself and for his country, the quarrel in progress between the Senate and President Wilson over the Treaty of Versailles hampered him seriously in fulfilling the charge entrusted to him. His public appearances in England in the years immediately following the war were very few; but he showed a keen interest in the League of Nations; and he took a leading part at the foundation, in July 1920, of a British Institute of International Affairs in order to promote among Englishmen international thinking.

He published in 1899 a book on *Fly-Fishing*, his favourite recreation. In 1885 he married Dorothy, daughter of Shellcross F. Widdrington, of Newton Hall, Northumberland. She was killed in a carriage accident in 1906; there were no children of the marriage. (G. E. B.)

**GRIERSON, SIR JAMES MONCRIEFF** (1859–1914), British general, was born Jan. 27 1859 and joined the Royal Artillery in 1877. Noted from the outset as an exceptionally keen student of his profession, he served on the staff in the Egyptian Expedition of 1882 and the Suakin Expedition of 1885, and again, having in the meantime passed through the Staff College, in the Hazara Expedition of 1888 (for the latter campaign he was in 1895 promoted brevet lieutenant-colonel). From 1896 to 1900 he was military attaché at Berlin. As a colonel he was with Lord Roberts during the advance from Bloemfontein into the Transvaal; but he was then transferred to China to act as British military representative on the staff of Field-Marshal Count Waldersee, commander-in-chief of the Allied forces against the Boxers. For his services he was given the C.B.

In 1904 he was appointed Director of Military Operations and promoted major-general, and he held command of the 1st Div. at Aldershot from 1906–10. Promoted lieutenant-general in 1910 and made a K.C.B. in 1911, he was in 1912 put in charge of the Eastern Command. On the outbreak of the World War Sir J. Grierson was selected for the command of the II. Army Corps. He proceeded to France, but died suddenly on Aug. 17 while his troops were still assembling in the area of operations. A good linguist and unusually well acquainted with most of the European armies, Grierson had taken full advantage of his varied military experience, and had shown himself well fitted for high command in the field.

**GRIFFITH, SIR SAMUEL WALKER** (1845–1920), Australian lawyer and statesman, was born at Merthyr Tydvil June 21 1845, the son of the Rev. Edward Griffith, afterwards of Brisbane. He was educated at the university of Sydney, graduating in 1863 and winning a travelling fellowship two years later. In 1867 he was called to the Queensland bar, and was also called in New South Wales and Victoria. He became Q.C. in 1876. He entered the Legislative Assembly of Queensland (1872), was Attorney-General 1874–8 and again 1890–3, was Minister for Public Instruction 1876–9 and 1883–4 and for Public Works 1878–9, and was Premier of Queensland from 1883–8 and again from 1890–3. From 1893 to 1903 he was Chief Justice of Queensland and from 1899 to 1903 also Lieutenant-Governor. In 1903 he became the first Chief Justice of the Australian Commonwealth and held that office until 1919. He was the chief bulwark of the Conservative cause in Australia and his cold, clear intellect, never deflected by passion and rarely by sympathy, has left a deep stamp on Australian national life. His early draft of a constitution for the Federation was rejected because it was not "popular" enough, but its one essential check remained in the later "popular" constitution—that of a High Court with supreme power over the Executive and the Legislature. He published *The Queensland Criminal Code*, as well as a translation of Dante's *Divina Commedia* (1912). He died at Brisbane Aug. 9 1920.

**GROENER, WILHELM** (1867– ), German general, was born Nov. 22 1867 at Ludwigsburg, Württemberg. In 1912 he was a sectional chief of the railway section of the German army with the rank of lieutenant-colonel. During mobilization in 1914 he was at the head of the German field railway service. In 1915 he was promoted to the rank of major-general, and from May 27 1916 to Aug. 1917 he was at the head of the War Office and a member of the directorate of the War Food Supply Office. He subsequently returned to the front as divisional commander and leader of an army corps, and in 1918 was chief of staff of the army group under the command of Linsingen and afterwards of Eichhorn. From Nov. 1918 to Sept. 1919 he was the successor of Ludendorff in the position of quartermaster-general. He retired as a protest against the signature of the Treaty of Versailles. During his tenure of office at the Ministry of War Gen. Groener was instrumental in maintaining, in spite of strikes and other difficulties, the coöperation of the German trade unions in securing a steady supply of munitions.

**GROSSMITH, GEORGE** (1847–1912), English comedian (*see* 12.619), died at Folkestone March 1 1912.

His son, GEORGE GROSSMITH (1874– ), English comedian and third of the name, who made his first appearance at the Shaftesbury theatre in an operetta by his father, became a well-known figure in musical comedy, especially at the Gaiety theatre, London. He was the author, or part author, of many musical plays, songs and revues, and took a leading part in popularizing revue in London. Together with Edward Laurillard he became lessee and manager of several London theatres. During the World War he served as lieutenant in the R.N.V.R.

**GROSSMITH, WEEDON** (1853–1919), English comedian, brother of the second George Grossmith, was born in London June 9 1853. He was educated as a painter and exhibited at the Academy and the Grosvenor Gallery; but in 1885 he joined Rosina Vokes's theatrical company and went on tour in the provinces and in America. He first appeared in London at the Gaiety theatre in 1887 as Woodcock in *Woodcock's Little Game*; but his earliest notable success was made in *A Pantomime Rehearsal*. He played with Irving at the Lyceum theatre, with Tree at the Haymarket and with Mrs. John Wood at the Court theatre. In 1894 he entered into management on his own account at Terry's theatre and produced a play of his own, *The Night of the Party*. His gift of quiet humour brought him much success, and among his best impersonations may be mentioned Archibald Bennick in *The New Boy*, Jimmy Jinks in *Baby Mine*, the Earl of Tweenwayes in *The Amazons*, "Boney" in *The Misleading Lady* and the Judge in *Stopping the Breach*, this being the last rôle he ever played (1917). In 1913 he published his autobiography, *From Studio to Stage*. He married Miss May Palfrey, who was also an actress. He died in London June 14 1919.

**GRUNDY, SYDNEY** (1848–1914), English dramatist (*see* 12.640), died in London July 4 1914. His last play, *A Fearful Joy*, was published in 1908.

**GUAM** (*see* 12.648).—The population of the island on July 1 1920 was 14,724, of whom the natives numbered 13,698; foreign-born, 548; personnel of the naval station, 478. In shape the island, which has an estimated area of 225 sq. m., bears a resemblance to the sole of a human foot. Apra harbour, with

proper improvements, could easily shelter a large fleet. Distances from Apra are approximately: Yap, 458 m.; Manila, 1,506 m.; Yokohama, 1,353 m.; Sydney, 3,067 m.; Honolulu, 3,337 m.; San Francisco (direct), 5,053 m.; Panama, 7,988 m. The mean average temperature is 81° F., with a mean maximum of 88° F. and a mean minimum of 72° F., but the heat is minimized, especially during the hottest months, by a constant breeze. The chief products are copra (the only export), maize or Indian corn (introduced from Mexico many years ago and the chief food crop), rice, taro, yams and sweet potatoes, breadfruit, plantains and bananas.

Education is in charge of a naval officer, who is assisted by a superintendent and district superintendent, as well as by 13 teachers furnished by the Federal Government. In 1920 there were 1,894 pupils of school age, 345 pupils over school age, an average daily attendance of 1,769; total number of teachers and substitutes 67, and of schools 14. The total cost of the schools to the island Government (exclusive of cost of upkeep and of four Guam Government students in the United States) was $14,500. Congress makes no appropriation directly for education purposes, but the naval station meets a part of the expenses. Instruction is in English. Considerable advance has been made in health and sanitation work. Guam has no private physicians, and the navy furnishes all medical assistance through a corps of eight medical officers, two dental surgeons, three pharmacists, eight navy nurses, and 30 hospital corps men. The disfiguring disease *gangosa* is being stamped out and its effects are no longer seen except among persons over thirty. All lepers have been sent to the island of Culion, the Philippine leper colony. Intestinal parasites, tuberculosis, and various skin diseases form the greatest menace to health, while hookworms abound. The work inaugurated by the Rockefeller Institute has resulted in an improvement of sanitary conditions.

Congress has never legislated for Guam. The governor, who is also the commandant of the naval station, combines in himself all functions of government, even some judicial authority, for an appeal lies to him in almost all cases. Most of the other Government officials belong to the naval station. The law in effect is the old Spanish law as changed by the Acts of the governor. The laws are in a chaotic state and badly in need of revision. There is no legislature, but for several years there has been a so-called congress with only advisory powers. The police department is wholly native with the exception of the chief and assistant chief, who are marines. The Insular Patrol, formed of marines, has certain constabulary duties, acts as fire wardens, and aids and advises the natives in their farming and in other ways. Of the able-bodied male natives between 16 and 60, numbering approximately 3,000, some 600 are employed by the Federal or island Government, while about 400 are employed in various town occupations, leaving about 2,000 for agricultural work. An effort is being made to introduce modern agricultural methods, so that the island may become self-sustaining. Since 1916 an effort has been made to exterminate the pest of rats, and about 1,750,000 of these rodents were destroyed in 29 months. The Commercial Cable Company has a cable station with connexions to Manila, Yokohama, Midway, and Yap. In Nov. 1917 the Navy Department opened a high-power radio station. Imports for 1920 were valued at $408,263.88, and exports at $34,132.94. The United States furnished $313,212.65 of the imports and took $15,148.59 of the exports. In 1920 imported foodstuffs were valued at $147,870.74. Government receipts in 1920, $155,209.06; and expenditures, $137,205.60.

In 1914 the German raider "Cormoran" was interned in Apra harbour, and after the United States declared war on Germany was blown up by the crew. The latter were captured and interned in camps in the United States, being the first German prisoners taken by U.S. troops. All the able-bodied young men in Guam enlisted in the militia formed for the protection of the island. In July 1918 a disastrous typhoon struck the island, and in three hours destroyed all the crops and ruined many of the coconut trees. Aid was rendered by the American Red Cross. Since 1899 there have been 22 governors and acting governors, all naval officers.

Cox and others: *The Island of Guam* (U.S. Government Printing Office, 1917); Guam Agricultural Experiment Station (annual reports beginning with that for the year, 1910–1); Annual Report, Governor of Guam, 1920; *Census of Guam* (U.S. Government Printing Office, 1921).

(J. A. Ro.)

**GUATEMALA** (*see* 12.661).—Manuel Estrada Cabrera's last election as president occurred in 1917, when he was chosen to succeed himself for the period ending in 1923. He controlled the republic for 22 years through a military dictatorship which depended upon the dense ignorance of the masses and the bitter factional strife among the upper classes. He maintained his sway by a standing army, a police force, and a secret service which suppressed and persecuted opposition. The revolt which unseated him began in 1920 with the press, which severely criticized his monetary and administrative systems. The Government seemed impotent to repair the damage caused by the 1917 earthquake, and the press attacked the Government for its inadequacy. Bishop Piñol began to lead the people to think on social and political topics. Then the Unionist party arose, at first composed of less than a dozen intellectuals and business men, who organized in Guatemala City in Dec. 1919. Its policy was to effect by quiet means and legally a change in the system of government. Soon the party was supported by many thousands. The demand grew for the elimination of Estrada Cabrera, for strict observance of the constitution, and for restoration of popular political rights. The National Assembly took up the movement, which the President tried to check by force. Many were imprisoned, and reforms in elections and exercise of civic rights were denied. The reformers abstained from the use of weapons, but they increased in numbers and influence until finally Estrada Cabrera took refuge at his country home and determined to shell the capital. The army went over to the opposition, and the President resigned in April 1920 in favour of Carlos Herrera, the *primer designado*, or vice-president. The Congress confirmed Herrera in the executive power. At the subsequent election he had two opponents, but was overwhelmingly elected for the term expiring March 1923. President Herrera, a member of a prominent family, was then about 55 years of age. He had travelled widely in Europe and the United States, and had been in 1915 a member of the Pan-American Financial Congress. He controlled an agricultural estate of over a million acres, half of which was utilized, and employing modern methods and machinery. With his brothers, he was interested in banking and commerce. His governmental aims were said to include the reduplication in Guatemala of the democratic institutions of the United States. His administration welcomed foreign capital, favoured immigration, and assisted in the development of all natural resources. The Herrera Government was promptly recognized by the leading Powers of America and Europe. It interested itself in repairing the earthquake damages, in erecting government buildings, hospitals, a national theatre, a national institute, and other needed work. The Unionist party of Guatemala favoured the Central American Union, the pact for which was signed at San José de Costa Rica Jan. 20 1921. The Union was declared on Oct. 10 1921, and was composed of Guatemala, Honduras and Salvador. Nicaragua refused to sign the pact. Costa Rica signed but this action was later rejected by the National Assembly. On Dec. 6 1921 a revolutionary *coup d'état* overthrew Herrera and his Government; and the former president surrendered his powers to a Provisional Government headed by General Lima and General Orellana.

During the early period of the World War there was a great influx of German emissaries from Mexico, who attempted to keep Guatemala from joining the Allies. In spite of their activities the republic broke off diplomatic relations with Germany April 27 1917, and this action was considered subsequently by Estrada Cabrera to be tantamount to a declaration of war. The territorial waters, ports, and railways of the country were offered to the United States for war uses in the common defence. Peace was declared with Germany Oct. 3 1919.

*Economic and Social Conditions.*—The estimated pop. in 1912 was 2,119,000; in 1914 the estimate was 2,003,579, but in that year the births were said to number 76,551 and the deaths 40,878, leaving a surplus of 35,673. The estimates for the total pop. 1912 and the total pop. for 1914 are therefore probably not exact. The foreign pop. in 1912 was estimated at 12,000. The total expenditures for education in 1916 were £34,074. In 1917 there were 1,942 government schools with 54,479 pupils in attendance. The Government established the Universidad Estrada Cabrera, opened Sept. 15 1918. For 1918–9 the national revenues amounted to 110,937,325 paper dollars and the expenditures to 77,666,023 paper dollars. In Dec. 1918 the total external debt with interest was £2,301,563. The internal debt in Dec. 1916 was 135,799,843 paper dollars and 1,091,702 gold dollars. The British claims were adjusted in 1913 after a warship had been sent to Guatemalan waters, and an appeal by Guatemala had been made to the United States for assistance.

The largest crop was coffee. There were 1,300 plantations, covering 96,000,000 sq. yd. and containing 430,000,000 coffee-trees. In

1918 the crop amounted to 110,000,000 lb. of which between 50% and 60% was German-owned. In 1918 coffee exports were worth $8,562,715. Sugar ranked second in importance. In 1918 there were produced 42,000,000 pounds. In 1916 the banana and plantain crop was 9,351,485 bunches; and 6,110,900 quintals of corn were produced. The cattle production in 1915 amounted to 1,470,200 head of all varieties. The total imports in 1918 were worth £1,326,800, and the exports £2,263,800. By far the greater part of the commerce was with the United States. The British trade showed in 1919 £292,521 exports from Guatemala and £396,182 imports. This was a marked increase over the trade of the war period. In the same year 601 vessels entered Guatemalan ports, 175 being American and 129 British. In Dec. 1915 the State took over all the ore lands in the country, ordaining that they might be exploited only under leasehold.

The International railway of Central America, incorporated in 1912, was a consolidation of the Guatemala railway (195 m.), the Guatemala Central (139 m.), the Occidental railway (51 m.), and the Ocos railway (22 miles). The main lines at the close of 1920 ran from Puerto Barrios on the Caribbean to Guatemala City, 194·5 m., and thence to San José de Guatemala on the Pacific, 74 miles. A Salvadorean division 40 m. long was separately operated. In 1914 the International railway bought a 60-m. line from Santa María to Las Cruces and continued it 45 m. to Ayutla on the Mexican border. Through service began Oct. 1 1916. A line was also projected from Santa María to Santa Ana in Salvador. The plan was to provide continuous service from Vera Cruz, Mexico, to Panama along the western portion of Central America. Telegraph lines in 1917 amounted to 4,337 m., and telephone lines to 531 miles.

The Banco Nacional Privilegiado, established April 11 1918, made agricultural loans, and assisted in rehabilitating earthquake-destroyed areas and transacted commercial business. Its capital was owned by the Government and by native and foreign capitalists. There were four other established banks, antedating 1910, whose paper money in circulation in 1916 was 183,000,000 paper pesos.

(H. I. P.)

**GUBERNATIS, ANGELO DE,** COUNT (1840–1913), Italian man of letters (*see* 12.667), published in his later years a series of lectures on Italian poetry (1907), and a *Dictionnaire internationale des écrivains du monde latin* (1905–6). He died at Rome Feb. 26 1913.

**GUCHKOV, ALEXANDER** (1862– ), Russian politician, was born in Moscow in 1862. His father was a factory owner of some means, whose family came from a stock of Old Believers, who had acknowledged the authority of the Russian Orthodox Church while keeping the ancient ritual for which their forefathers had endured persecution since the days of Patriarch Nikon. Guchkov's mother was French. He studied history and humanities at the university of Moscow, and, after having gone through his military training in a grenadier regiment, left for Germany where he read political economy in Berlin under Prof. Schmoller. Academic studies were, however, not suited to his active and adventurous character. He gave them up and started travelling. He rode alone on horseback through Mongolia to western Siberia, and narrowly escaped being slaughtered by a mob. During the Boer War 1899–1902 he volunteered for service against the English and joined Gen. Smuts's commando. He was shot in the leg, picked up by the English, and successfully treated, although he remained slightly lame. He was elected by the Moscow municipal Duma to be a member of the executive (Uprava), and took active part in the self-government of the city. During the Russo-Japanese War he served in the Red Cross and in the Municipal Union for the organization of hospitals; he was left to take care of the Russian wounded after the battle of Moukden, and showed much dignity and efficiency in the performance of his arduous duties. When the first Russian revolutionary movement developed in 1905 he took part in the meetings of Zemstvo representatives, but did not join the Cadets, whom he considered to be too doctrinaire and cosmopolitan. Together with D. Shipov, E. Trubetzkoy and N. Lvov, he founded the Octobrist party, in the hope that the Tsar's Government would recognize the necessity of great reforms and work with the moderate Liberals of the Zemstvos while safeguarding the monarchical principle. Stolypin was for some time in sympathy with that programme, and even contemplated the formation of a Ministry strengthened by leaders of public opinion, of whom Guchkov, Count Heyden and N. Lvov would have been prominent members. When this project came to grief, Guchkov continued to support Stolypin. In the third Duma, elected on a restricted franchise, the Octobrists assumed the leading rôle. After Khomiakov's resignation in 1910 Guchkov was elected speaker. He attacked with patriotic eloquence the "irresponsible influences" at Court and the shortcomings of the Ministry of War in preparing for the inevitable conflict with Germany. As Stolypin became more and more violent and reactionary, the Octobrists lost their standing ground, and Guchkov eventually resigned the presidentship of the Duma. In the elections to the fourth Duma he failed to secure a seat. He came again into prominence, however, during the World War. He was put in charge of the Red Cross organization on the German front, and it fell to him to search for the corpse of the unfortunate Samsonov. When the campaign of 1915 had disclosed the incredible inefficiency and corruption of the Russian War Office, Guchkov threw his whole energy into the work of refitting the army on the technical side. He was one of the principal workers and leaders of the mixed committees for the defence of the country, formed with the help of the Zemstvos and towns. He was not content with laying the blame at the door of the effete War Office, but deplored the apathetic way in which the Tsar passed the time at headquarters, without any clear political plan, holding on supinely to formalism and routine, yielding to the spasmodic interference of the Empress.

When the March Revolution of 1917 broke out Guchkov was called in to take charge of the Ministry of War. Together with Shulguin, he submitted the Act of Abdication for signature to Nicholas II. He was powerless against the mounting flood of desertion and demoralization in the army, and he was the first of the ministers to resign in despair. In the "emigration" he found himself without proper place and influence. He would have liked to organize a big move against the Bolsheviks from the west, but such a move could not be made while the Entente Powers were resolved to keep Germany out, and while they sympathized with all the new organizations hostile to Russia—Esthonia, Latvia and Poland. Later he took refuge in Paris, where he pleaded for a national reunion of all parties against the Red tyrants.

(P. VI.)

**GUERRINI, OLINDO** (1845–1916), Italian poet (*see* 12.672), died at Bologna Oct. 21 1916.

**GUIANA.**—(For BRITISH GUIANA *see* WEST INDIES, vol. 32.) DUTCH GUIANA (*see* 12.680). The pop. of Dutch Guiana, excluding the Indians and negroes of the interior, was in 1910, 86,233; in 1918, 92,284; and on Dec. 31 1919, 109,810, including Dutch, British, Hindus, Javanese and Chinese; 1,109 were Europeans. In 1910 the pop. of Paramaribo, the chief city, was 35,346; in 1919 it was 36,038.

The country grants full religious liberty and in 1918 there were 24,624 Moravian Brethren, 20,850 Hindus, 19,698 Roman Catholics, 12,489 Mohammedans, 9,733 Reformed and Lutherans and 847 Jews. In 1910 there were 25 public schools with 2,889 pupils and 38 private schools with 6,016 pupils; in 1918 there were 30 public schools with 3,806 pupils and 43 private schools with 6,724 pupils. The chief agricultural products are sugar, rice, cacao, maize, coffee and bananas. Of these sugar is the most important. Rum and molasses are produced in large quantities. The following table shows production:—

| | 1910 | 1918 |
|---|---|---|
| Sugar | 26,433,220 lb. | 26,588,509 lb. |
| Rice | 4,386,140 lb. | 8,260,560 lb. |
| Cacao | 3,702,600 lb. | 4,152,940 lb. |
| Maize | 2,911,260 lb. | 4,121,920 lb. |
| Coffee | 445,060 lb. | 4,076,600 lb. |
| Bananas | 462,200 bunches | 733,800 bunches |
| Rum | 210,779 gal. | 294,805 gal. |
| Molasses | 43,356 gal. | 3,709 gal. |

In 1910 the gold production was 18,745 oz.; in 1917, 25,869 ounces. In 1910 the production of balata, a species of gutta-percha, was 1,495,342 lb.; in 1917 it was 1,952,643 pounds. The country's exports and imports were valued as follows:—

| | 1910 | 1917 |
|---|---|---|
| Exports | £692,900 | £732,816 |
| Imports | 614,121 | 632,442 |

In 1910 there entered 240 vessels of 210,998 tons and cleared 243 vessels of 215,391 tons. In 1917 there entered 133 vessels of 182,788 tons and cleared 133 vessels of 185,562 tons. The local revenues are not sufficient to meet expenditures, and the Dutch Government makes up the annual deficit by subventions.

| | 1910 | 1920 | 1921 (est.) |
|---|---|---|---|
| Expenditures . . | £555,899 | £425,040 | £691,067 |
| Local revenues . . | 479,786 | 296,753 | 261,560 |
| Subvention . . . | 76,113 | 128,287 | 174,125 |

In 1920 there was only one railway, extending from Paramaribo to Macami, about 90 m. in length. At that time, in addition to papers published in Dutch, there was an English weekly, *The New Paramaribo Times*. The Dutch force in the country averages some 250 officers and men.

FRENCH GUIANA (*see* 12.681). The pop. of French Guiana, excluding Indians and negroes, was, in 1911, 49,000; in 1918 it was only 26,325. In addition the country has many convicts deported from France; those in 1918 in the penal settlement numbered about 9,000. Cayenne, the chief city, had, in 1911, 13,527 inhabitants; in 1919 the population was 13,609. The prevailing religion was Roman Catholic.

In 1910 there were 24 primary schools with 2,230 pupils; in 1918 there were the same number of primary schools but with 2,003 pupils. In the latter year there were also in the penal settlement 4 schools with 163 pupils. The country produced few agricultural products, the total cultivated area being in 1919 only about 8,800 acres. Sugar, coffee, cacao, maize, potatoes and bananas were produced in small quantities. Rosewood extract and balata were among the exports. The most important industry was gold-mining, for which concessions are granted by the Government. In 1910 there were produced 123,168 oz., and in 1918, 80,477 ounces. Of exports France takes the largest part, averaging 66%, Switzerland 30%, Great Britain 2%, and the United States 1%. Of imports France and her colonies send about 70%, Great Britain and her colonies 17%, and the United States 7%. Of exports gold averages 90%. The value of exports and imports was as follows:—

| | 1910 | 1918 |
|---|---|---|
| Exports . . . . . | 11,567,168 fr. | 15,321,697 fr. |
| Imports . . . . . | 12,213,420 fr. | 15,308,526 fr. |

The local revenues do not as a rule equal expenditures and the home country makes up the deficit. In 1911 France's expenditure on the colony was 6,497,394 fr., including 5,884,000 fr. for the penal settlement. In 1920 the chief towns were connected by telephone and telegraph line between Cayenne and the Maroni, and the Compagnie Française des Cables Télégraphiques owned lines to Paramaribo, the Antilles and Pará. In 1920, besides small railway lines to the gold-mines, there was a line from St. Laurent du Maroni to St. Jean. In 1919 the French military force in the country consisted of 150 officers and men.

**GUILD SOCIALISM**, the name given to a school of socialist thought which originated in England early in the 20th century, and has since spread to other parts of the world, particularly to the English-speaking countries—the United States, Australia, New Zealand and South Africa—and to Japan. As its name implies, it had, in the minds of those who originated it, a definite relation to the forms of industrial organization which existed throughout the mediaeval world, and it was an attempt to apply to the solution of modern industrial problems certain of the principles which were in active operation in the economic organization of mediaeval society. This does not mean that Guild Socialism is an attempt to restore the mediaeval guild system, or that it has any necessary relation to the restoration of a system of hand craft in place of the modern system of machine production. In harking back to the mediaeval organization of industry, Guild Socialists for the most part have in mind not the forms of production which prevailed in the Middle Ages, but the mediaeval principle of industrial self-government.

The origin of the Guild Socialist movement is to be found in *The Restoration of the Gild System* (1906), a book written by A. J. Penty, the well-known architect and craftsman, and in an article published at about the same time in the *Contemporary Review* by A. R. Orage, editor of the *New Age*, which was, during the following decade, very closely associated with the guild propaganda. In both these articles Guild Socialism appeared in an essentially preliminary form, and the emphasis was laid, far more than by the more recent guild writers, on an actual restoration of the mediaeval system. Mr. A. J. Penty, who has perhaps the best claim to be regarded as the originator of the modern guild movement in this form, took the craftsman's point of view and set himself in direct hostility to the modern systems of large-scale production and trading.

From 1906 to 1912 the guild idea developed gradually and almost unnoticed in the columns of the *New Age;* but during this period a gradual transformation of the theory was taking place, and the emphasis was coming to lie, not upon the return to craft organization or the restoration of a system closely similar to that of the Middle Ages, but upon the utilization of the modern trade-union and working-class movement as the basis for a system of industrial self-government, directly related to modern conditions and to large-scale production. During this stage the propaganda for the "restoration of the gild system" was developing into the propaganda of *National* Guilds, the emphasis on the word "National" indicating the necessity for a different kind of guild system corresponding to the "National Economy" of modern times.

This transition was made definite, and the first attempt to expound the new guild theory as a complete system of socialism began to be made in the *New Age* in 1912, when a series of articles, subsequently reprinted in the volume, *National Guilds*, which was written by S. G. Hobson, and edited by A. R. Orage, was published week by week. It was with the publication of these articles that the guild theory first became a definite force in the British socialist movement.

While this process of theoretical development was going on the situation in the British industrial world was rapidly changing. The earlier years of the 20th century were years of comparative industrial tranquillity, during which the main attention of the working-class movement was concentrated on political questions and on the building-up of the Labour party. From 1909 and 1910 onwards, however, a big wave of industrial unrest passed over the country. Big strikes broke out in a number of the most important industries, and a great stimulus was given to the movement for wider industrial combination. This industrial ferment also served to arouse a corresponding ferment in the realm of ideas. New socialist theories, based mainly on the working-class industrial organizations, sprang rapidly into prominence, and in particular the "Industrial Unionist" ideas, which had entered Great Britain from America a few years earlier, and the syndicalist ideas derived from contemporary developments in the French labour movement, gained for a time a large number of adherents and excited vigorous controversy. It was in the midst of this controversy and of this industrial ferment that the guild idea developed from a "Utopian" plan for the restoration of mediaeval conditions into the outline of a practical policy of industrial self-government, appealing particularly to the British organized working-class movement. The transition, however, was not fully completed with the publication of the "National Guilds" series of articles in the *New Age;* for the influence of the *New Age*, although it was during these years steadily growing, reached only a comparatively narrow circle of intellectuals in the middle and working classes. It was when a group of the younger men took up, from 1913 onwards, the wider dissemination of these ideas, particularly through the then newly founded Labour paper, the *Daily Herald*, that the movement began to exercise an influence over larger circles. This wide appeal, moreover, also resulted to some extent in a transformation of the Guild Socialist theory itself. The theory became steadily less Utopian and remote; and its advocates applied themselves more and more to a study of actual, pressing trade-union problems, and to the working-out of proposals for the "next steps" to be taken.

Up to this point the guild movement had remained entirely unorganized, save for the small degree of cohesion secured through the medium of the *New Age*. It was in 1914 that the idea of creating an organization for the propaganda and study of Guild Socialism in England first took shape at a private conference of the younger Guild Socialists. This led, at Easter 1915, to the formation of the National Guilds League, which immediately set on foot an active propaganda in the working-class and professional movement. There is no doubt that this propaganda was largely helped by the conditions of war-time industry. Workshop problems were constantly arising owing to the operation of dilution and to war-time changes in the

methods and forms of production. This situation served to awaken a critical spirit in the workers, and made them more ready to listen to plans for a change in the industrial system.

It is legitimate to say that by 1921 the guild propaganda, while it had not made any direct appeal to the larger masses of the workers in Great Britain or other countries, had come to exercise a powerful influence over a steadily growing number of the younger local and national leaders of the Labour movement and in the professions. This influence could be seen in the changing policies and programmes both of trade unions and professional associations and of socialist societies. For example, the Miners' Federation, which before the war advocated a measure of nationalization of the mines which would have placed them under direct State administration, laid before the Coal Industry Commission, in 1919, a scheme which was in substance an adoption of the Guild Socialist proposals for industrial self-government. Similar influences have been at work in other industries, notably in the post-office, on the railways and in the building industry. The influence of the Guild Socialist propaganda has also been considerable in the professions, and especially in the teaching world; while in the sphere of socialist organization the policy and programme of the Independent Labour party, the Labour party and other organizations have been largely changed so as to incorporate the idea of control of industry by the workers more or less on the lines advocated by the Guild Socialists.

The National Guilds League, which is the only organization directly representing the Guild Socialist movement in Great Britain, defines its objects in the following terms: "The abolition of the Wage System, and the establishment by the workers of Self-Government in Industry through a democratic system of National Guilds, working in conjunction with other democratic functional organizations in the community." An examination of this definition will serve to indicate clearly the main ideas upon which Guild Socialism is based.

The central idea, undoubtedly, is that of self-government in industry. The guild propaganda is above all connected with the advocacy of a change in the system of industrial administration which would result in placing the power and responsibility of administration in the hands of the workers engaged in each particular industry or service. Guild Socialists have always stressed the point that by "workers" they mean not simply the manual workers engaged in industry, but the whole necessary personnel. Indeed, the oft-used phrase "workers by hand and brain" seems to have been coined by the Guild Socialists, and was used by them from the beginning of their propaganda. They have stressed, moreover, not only the need for common action by all the workers "by hand and brain," but also the need for the recognition, in any form of democratic industrial organization, of vital functional differences between one grade of workers and another. The democracy which they have advocated has been not the government of industry by indiscriminate mass voting, but a system in which power and responsibility would be definitely related to the particular function which each individual or group of individuals is called upon to fulfil in the service of the community.

The central idea of Guild Socialism is thus the idea of functional democracy, or, in other words, the application of democratic principles to the organization of all forms of industry and public service. This advocacy is closely combined in Guild Socialist propaganda with a critique of the current conceptions of democracy. Guildsmen are fond of pointing out that the present forms of democratic organization, which may be called, for short, "parliamentary democracy based on universal suffrage," are not in reality democracy at all, and do not in fact provide for the direction of the affairs of the community by the positive wills of its members. They urge that it is useless to look for effective democracy in the political sphere as long as the principle on which industry, which so largely dominates men's lives in modern communities, is organized is the principle of autocracy, or, at best, of fundamental class divisions. In this aspect their teaching may be regarded as a precise application of the Marxian "materialist conception of history," to the criticism of modern parliamentary democracy. If industry is democratically organized, they hold that real democracy in the political sphere will follow almost as a matter of course; but, as long as men, in their daily work, are compelled to submit to external dictation and have no recognized voice in the ordering of their service, these class conditions, they hold, will inevitably reproduce themselves in the political sphere. Guildsmen say that "economic power precedes political power."

The central object, then, of the Guild Socialists is to establish democracy in the sphere of industry, and thereby to secure that it shall be applied throughout the whole sphere of social organization. In advocating such a change they recognize that their hope of success rests on relating their ideal definitely to actual movements existing within the world of capitalism, but capable of being so transformed as to supplant capitalism and replace it in the organization of industries and services. They have therefore always based their propaganda directly upon the organizations which the manual and professional workers have created for the purpose of protecting their interests and improving their position under the wage system, and they have sought to persuade these organizations to accept the principle of industrial self-government, and to work for the realization of it by endeavouring, in proportion as their power increases, to extend their actual control over capitalist industrialism. Mention has been made above of the transformation which has taken place in the programmes of many trade unions and other working-class bodies, largely under the influence of Guild Socialist ideas. The members of these bodies, from regarding the purpose for which their organizations are built up as limited to the protection of their members' interests under the wage system in face of those by whom they are employed or the securing of useful legislation, are gradually broadening their conception of the function of these organizations so as to include the assumption of direct "control" and responsibility for the organization of industry. Nor is this influence manifest only in the changing programmes of the working-class organizations, but also in their positive policy and action. It was particularly plain in the "shop stewards' movement" in the British engineering and kindred industries, which, during the war, endeavoured to establish in the workshops a wider measure of direct trade-union "control of industry." It is also manifest in the widening of the range of industrial disputes, and in the putting forward by the unions of claims which involve the recognition of their right to interfere and negotiate on behalf of their members in connexion with questions of "discipline" and "management." It appears further in demands that foremen and supervisory workers should be members of the trade unions, and even that they should be appointed by, and responsible to, those who have to work under them.

The most remarkable outcome of the guild propaganda, and also the only important practical experiment which the Guild Socialists have so far been able to make, is to be found in England in the Building Guild movement. Towards the end of 1919 a movement arose, largely fostered by the local branch of the National Guilds League, among the building operatives in the Manchester area, for the formation of a guild which would be prepared directly to undertake work, especially on behalf of the public authorities, in the sphere of house-building. A local Building Guild organization, governed by representatives from the local management committees of the various building-trade unions, was set up in the Manchester area, and the movement spread very rapidly throughout the country, so that during the following year something like a hundred local Building Guild committees, linked up in a central organization, were brought into being. These guild organizations proceeded to make tenders to the local authorities for the carrying-out of the housing schemes which were then being brought forward in most parts of the country, and after some difficulty the Ministry of Health was induced to sanction a limited number of contracts on an experimental basis. In March 1921 work was already proceeding on about 20 such contracts.

Some of the difficulties which arose in the starting of the Building Guild movement serve to illustrate very clearly certain of the fundamental principles underlying the Guild Socialist movement. When the Building Guilds first tendered for contracts they were asked by the local authorities and by the Ministry of Health, as a private contractor would have been asked, what "financial guarantees" they were willing and able to give. They replied that they would give no financial guarantee, even if they were in a position to do so, since their intention was not to produce for profit, but to produce for the public absolutely at cost price. There is in the constitution of the Building Guilds not only no provision for capital or for interest or profits, but a definite clause which prohibits the distribution, under any circumstances, of any form of dividend or bonus or profit to the workers. This is one of the features which clearly differentiate the Building Guild movement from the movement for "Coöperative Production" with which it is sometimes confused. In their refusal to give financial guarantees the Building Guilds stressed the fact that they were in a position, as a private contractor was not, to give a "labour guarantee," *i.e.* a guarantee that they could and would supply all the labour, including technical and supervising ability, necessary for the execution of the job. Stress has been laid, throughout the guild propaganda, on the idea that the power of the workers is based on their possession of a "monopoly of labour," and the Building Guild movement itself is based on this monopoly, largely possessed by the trade unions which control the Building Guilds.

In the second place, difficulties arose because the Building Guilds firmly insisted that all workers employed by them must have security against unemployment, and must receive full-time wages irrespective of bad-weather conditions which so often cause an interruption of building work, of sickness, and of the other factors which serve to make the wages of the worker, especially in the building industry, vary so largely from week to week, and thus throw him into a position of permanent insecurity. This condition was accepted in the contracts actually signed by the Building Guilds and endorsed by the Ministry of Health; but considerable trouble subsequently arose over it in consequence of the opposition of the building-trade employers, who regarded it as "preferential treatment."

This point is very important, and is fundamental to the whole guild theory. In the statement of objects of the National Guilds League quoted above, it will be noticed that the Guild Socialists set out first of all to secure the "Abolition of the Wage System." A part of what they mean by this is that the conditions under which the workers at present receive wages involve permanent insecurity and are therefore degrading, and such as to place the worker at the mercy of the "governing class in industry." Guildsmen, therefore, have always made the principle of "continuous pay," or, as it is sometimes called, "industrial maintenance," a fundamental part of their propaganda. They have insisted that all those who are willing to do service for the community have a right to continuous pay in return for that willingness to serve, and that the maintenance of the "reserve of labour" is a necessary and legitimate charge upon the various industries, and forms a real part of their costs of production. This principle of "industrial maintenance" has undoubtedly been one of the most favourably received and influential aspects of the Guild Socialist policy.

Guildsmen thus claim the recognition, not only of the principle that the responsibility for industrial administration should be placed in the workers' hands, but also of the principle of economic security for every worker in the widest sense. They recognize fully that this involves changes far more fundamental than any mere alteration of the machinery of industrial administration. They are not simply Guildsmen: they are also Socialists. They are in agreement with other schools of socialist thought in holding that it is necessary to transfer the means of production and distribution and exchange from private hands to some form of communal ownership. They are, however, strongly hostile to the older schools of collectivism or "State" Socialism, which contemplate the nationalisation of industry in a sense which would involve its direct administration, after transference to public ownership, by the governmental organization of the political State. Guildsmen have always laid great stress in their propaganda on the evils of bureaucracy and political control in industry; and their system of direct workers' control is put forward as an alternative to State administration.

This, however, does not mean that they hold that the entire control of the various industries and services ought to pass into the hands of the workers organized as producers. They have always contemplated the exercise of direct producers' control over administration in close conjunction with a control over policy in which the representatives of the organized citizen-consumers would have an effective voice. This is what they mean when they say that self-government in industry will be exercised through guilds "working in conjunction with other democratic functional organizations in the community."

Guildsmen differ in their conception of the precise changes which are required in order to give effect to this principle. They are united in recognizing that the working-class coöperative movement is destined to play an important part as the representative of the organized domestic consumers in the society to which they look forward. But there is much difference of opinion amongst them concerning the character and rôle of the State. The majority in the National Guilds League has taken a view concerning the State which is closely similar to that of the Marxians. They regard the State as a form of capitalistic organization—"an Executive Committee for administering the affairs of the whole capitalist class"—and they look forward to its supersession "by forms of organization created by and directly expressing the will of the workers themselves. . . . It (the N.G.L.) holds, however, that the exact form of organization required in any country cannot be determined in advance of the situation which calls it into being." There is a minority, however, in the Guild Socialist movement which holds that the State is capable of adaptation to the function of acting as the political representative of the community in a state of society in which economic organization is based on the Guild Socialist principle of industrial self-government.

The Guild Socialist theory concerning the precise forms of socialist organization which would replace the present machinery of industry and the capitalist State is still in the making, or rather, to some extent, in the unmaking. Different Guild Socialist writers have put forward different views on this question; and on the whole the recent tendency of the Guild Socialist movement has been towards the abandonment of any attempt to define at all precisely the structure of the future society, and towards a concentration rather upon the principles and policies which are to guide the transition to it, preserving only in general outline a common conception of the character of the future organization. The movement has undoubtedly been influenced, as it has been sharply divided, by events in Russia from 1917 onwards. The National Guilds League in England has affirmed its "solidarity with the Russian Soviet Republic," but has refused to commit itself as an organization to Communist principles, or to declare for the adoption, in Great Britain, of methods similar to those which the Communists have applied in Russia. It is important to point out that the Guild Socialists and their organization, the National Guilds League, must not be regarded as a party or group at all parallel to other socialist organizations such as the Independent Labour party or the Communist party. Guild Socialists in many cases belong to, and work within, one or other of the socialist parties; and they are held together not so much by a common attitude on the question of socialist political policy, as by a common belief as to the principles which must guide the making of the new society—principles which are compatible with varying views as to the policy which it may be necessary to pursue in the political field. Differences on this question of method have not prevented the guildsmen from working together in their endeavour to promote in the trade-union world, and to a less extent in the coöperative movement, a policy designed to strengthen the demand for workers' control, and to bring about substantial encroachments by the

workers on the capitalist control of industry, even while the capitalist system as a whole remains in being. Mention has been made before of the development of the Building Guild organization. Side by side with this practical object-lesson, guildsmen have worked out policies for adoption in those industries in which it is not possible at present to establish guild organizations in rivalry with the existing capitalist system. They have supported, in the case of the railways, the mines and certain other industries, demands for nationalization, always, however, coupling their support with the demand that nationalization must be accompanied by a large measure of democratic control over administration. At the same time they have pressed, in industry generally, the policy known as "encroaching control." "Encroaching control" means the attempt by the trade unions, while not at once overthrowing capitalism or dispossessing the present owners of the means of production, to transfer into the hands of the organized workers as many as possible of the functions of control which are at present exercised by employers or their representatives. The two outstanding forms of this propaganda of "encroaching control" are to be found: (*a*) in the demand put forward by the guildsmen for the election of foremen and supervisors by the rank-and-file workers; and (*b*) in the policy known as "collective contract."

(*a*) Guildsmen are never weary of urging that in place of the present system, under which the foremen and industrial supervisors are appointed by the employers, usually from the ranks of the manual workers, the workers, through their trade unions, should take into their hands the right to appoint their own foremen and supervisors. This demand has not at present been conceded save in an insignificant number of instances; but the trade unions have taken certain steps towards it by securing, in numerous instances, the dismissal of foremen to whom their members have taken objection. The carrying-through of this policy of democratic election of foremen is closely bound up with the policy of "collective contract."

(*b*) By "collective contract" is meant a scheme capable of assuming a number of different forms, under which the whole of the workers in a particular shop, factory or department would make with their employer a single agreement as to their terms of service, the amount and character of their output, and the payment for it. Instead of the present system, under which the employer engages and pays each worker individually, and appoints his own representatives to exercise discipline in the workshop, the trade unions themselves, under this system, would make a contract with the employer to supply the necessary labour, including workshop supervision, and to carry out the work required, and would thus control engagements and dismissals as well as workshop discipline. The employer, instead of paying each worker individually, would pay to the union, or to the works committee on its behalf, a lump sum, which the workers would then distribute amongst themselves in such a way as they might agree upon. By this arrangement, it is contended, the employer would be directly excluded from a certain sphere in which he now exercises control. The workers would thus not only get a valuable lesson and experience in the work of controlling industry, but would also greatly strengthen their position for a subsequent further assumption of power, which would involve the winning of industrial control over a wider area, including commercial as well as purely productive operations. This system, too, has not yet been adopted anywhere in full; but certain approximations to it have been made.

The guildsmen stress, in the whole of their propaganda, the need for an appeal to a new motive in industry if men are to be persuaded to put out their best efforts, and to do their best work in the service of the community. They claim that in the past, since the coming of large-scale industry, production has been secured mainly by the operation of two motives—fear (of unemployment and starvation) and greed (for higher remuneration secured, *e.g.* by "payment by results"). They contend that these two motives are showing themselves more and more inadequate to secure the continuance of production, and that this is shown both by the increasing frequency and severity of industrial disputes, and by the diminished willingness on the part of the workers to do their best. They maintain that a different spirit can be made to prevail in industry only if two conditions are satisfied. The first of these conditions is that the worker must have a sense that, in putting his best into his work, he is serving, not the private interest of any individual, but the whole community, and that his work is being directed to that end which will most conduce to the common benefit; the second condition is that the responsibility for doing his best must be placed upon the worker himself, and that he must be given freedom, in the form of self-government, in the organization of his work. These two ideas are often put together in the phrase "free communal service," which is regarded by guildsmen as the condition of the creation of reasonable industrial order. It is recognized that such an order would make higher demands upon the will and good-will of the mass of the people than the capitalist system; but guildsmen contend that, if the right appeal is made and the above conditions satisfied, the workers will rise to the occasion and will be prepared to do their best in the service of the public, because they will feel that they "count," and that the responsibility for the good conduct of industry rests directly upon them. Guild Socialists always insist that the power which goes with responsibility must be diffused to the widest possible extent among the whole mass of the people, and that this is the necessary condition of democratic efficiency and healthy social organization.

REFERENCES.—There is a large and growing literature dealing with Guild Socialism. See *National Guilds*, by S. G. Hobson; *Guild Socialism Re-stated*, by G. D. H. Cole; *The Meaning of National Guilds*, by M. B. Reckitt and C. E. Bechhofer; *Old Worlds for New*, by A. J. Penty; *Self-Government in Industry*, by G. D. H. Cole; other works by Hobson, Cole and Penty; and the various publications of the National Guilds League (39 Cursitor St., London, E. C. 4). For hostile criticism see *Guild Socialism*, by G. C. Field; *Our Social Heritage*, by Graham Wallas; and *The Case for Capitalism*, by Hartley Withers. For the social theory of Guild Socialism see *Social Theory*, by G. D. H. Cole; *Authority, Liberty and Function*, by Ramiro de Maeztu; *The Sickness of an Acquisitive Society*, by R. H. Tawney; and *Roads to Freedom*, by Bertrand Russell. For its industrial policy see *Chaos and Order in Industry*, by G. D. H. Cole; *The Nationalisation of the Mines*, by Frank Hodges, and the evidence volumes of the Coal Industry Commission, 1919 (evidence of Cole, Straker, Sleesser, and others). The National Guilds League publishes a monthly journal, *The Guildsman*, in which questions of Guild Socialist and trade-union policy are regularly dealt with, and news given of the movement in various countries. **GUILLAUMAT, MARIE LOUIS ADOLPHE** (1863– ), French general, was born at Bancqneuf (Charente Inférieure) on Jan. 4 1863. He entered the École de St. Cyr on Oct. 31 1882 and was appointed a sub-lieutenant of infantry on Oct. 1 1884. Four years later he was promoted lieutenant. In Nov. 1893 he became a captain and was transferred to the 147th infantry regiment. In 1903 he was appointed professor of military history at St. Cyr, and later became lecturer on infantry tactics at the École de Guerre. He was promoted lieutenant-colonel in 1907 and colonel in 1910. In Jan. 1913 he became director of infantry at the Ministry of War, and on Oct. 8 of the same year was made a general of brigade, continuing to hold his appointment. On June 14 1914 he became *chef de cabinet* when M. Messimy was War Minister, but on the outbreak of the World War he was placed at the disposal of General Joffre. On Sept. 2 1914 he was given command of the 33rd Division, becoming, in the following Dec., a temporary general of division. On Feb. 25 1915 he took part in the defence of Verdun, in the operations attending the German offensive of Feb. 1916, and in the French (Somme) offensive of the same year. He was confirmed in his rank as a general of division on Dec. 23 1915. In Dec. 1916 he took over command of the II. Army from General Nivelle when that officer was appointed commander-in-chief. Twelve months later (Dec. 14 1917) he succeeded General Sarrail as commander-in-chief in Salonika. In this capacity he had the difficult task of restoring the *moral* of a heterogeneous force that had become disorganized through inaction, and of reconciling the divergent military interests of the Allies in this theatre. He drew up the offensive plan which Franchet d'Espérey afterwards carried out so brilliantly, but in June 1918 was suddenly brought back to

Paris to act as military governor when the German summer offensives threatened to reproduce the conditions of the Marne. When the tide turned he actively supported the proposed Salonika advance by pressing its advantages on the War Council, and it was with his aid that Franchet d'Espérey obtained authority to advance. In Oct. 1918 he was given command of the V. Army. He was awarded the Grand Cross of the Legion of Honour on July 19 1918 and the médaille militaire on Oct. 3 1918. On Jan. 30 1920 he was appointed to the Superior War Council.

**GUISE, BATTLE OF.**—The name of the battle of Guise is given to the battle fought by the French V. Army on Aug. 29 1914, during the first Allied retreat, with the object of delaying the advancing Germans so as to take pressure off the British and to gain time for the debouchment of the newly formed French VI. Army.

By Aug. 25 the succession of battles fought in Lorraine, the Ardennes and on the Sambre had produced an atmosphere of optimism at German general headquarters. The Supreme Command was, however, led astray by the magic of imagination and mistook the shadow of victory for the reality, although it is true that the Germans were somewhat in advance of their time-table. Gen. von Moltke considered that the great decisive battle in the W. had been fought and ended in Germany's favour, and that the moment had arrived when forces might safely be sent to the eastern front. It was decided to send two corps from France to reinforce the VIII. Army in East Prussia. Gen. von Moltke's first intention had been to take these reinforcements from his left wing, but both the VI. and VII. Armies reported that they were opposed by superior numbers, and it was therefore decided to send two corps from the right. Accordingly the XI. and Guard Reserve Corps and a cavalry division received orders early on the 26th to proceed to the eastern front.

The bracing atmosphere of optimism breathed by Supreme Headquarters in their peaceful hotel at Coblentz, some 200 m. from the battlefield, had at least one rarefied "pocket" in the front line. On Aug. 26 Gen. von Bülow, the commander of the II. Army, was bewailing the fact that the III. Army on his left was not conforming to the south-westerly wheel of the II. Army, and that there was an awkward gap between the two. Further, on the 27th, the I. Army (which since Aug. 20 had been under Gen. von Bülow's orders) was suddenly removed from the control of the II. Army by order of the Supreme Command, thereby making the coöperation of the three right-wing armies still more difficult. On the side of the Allies, neither far behind the fighting nor in the front line was there any optimism, and indeed there was little to suggest a roseate view of the situation. Failure had dogged their early efforts, and the whole left and centre were being forced back. This circumstance, however, was not without its advantages, for it ensured that the Allied commanders-in-chief were in far closer touch with their forces than was the case on the German side. Far from attempting to deal with the situation from a couple of hundred m. in rear, Gen. Joffre and Field-Marshal Sir John French were on Aug. 26 deliberating within sound of the guns, and with the assistance of the French army commander most nearly concerned. The meeting took place in the billiard room of the house at St. Quentin which was serving as the headquarters of the British commander-in-chief. The moment was one of particular anxiety for Sir John French, for while awaiting the arrival of Gen. Joffre and Gen. Lanrezac—the commander of the French V. Army—the British field-marshal received the news that his II. Corps had not been able to comply with his orders to fall back from the line Cambrai–Le Cateau, and was now committed, and alone, to a battle. Staff officers were sent to Gen. Smith-Dorrien with peremptory orders to break off the fight and to resume the retreat forthwith. It was now nearly eleven o'clock, and shortly afterwards Gen. Joffre arrived with his chief-of-staff. He was followed by the commander of the French V. Army, and a discussion of the situation immediately began.

During the night which had preceded the conference Gen. Joffre had issued a new directive, to the effect that, the offensive which he had projected having proved incapable of realization, "further operations would be carried out with a view to forming a mass of manœuvre on the left flank to carry out an offensive." This mass of manœuvre was to be made up of the French IV. and V. Armies and the British, plus a new army—the VI.—to be made up of units moved by rail from other sectors, chiefly from the right. In theory these orders formed the basis of the discussions at the conference, though, as it happened, the rapid march of events had prevented orders being thoroughly assimilated by some of the recipients. Nothing very definite indeed seems to have been decided at the meeting beyond the understanding that the retreat was to be continued as slowly and deliberately as possible, until the Allies should find themselves in a favourable position to make a firm stand and take the offensive. Immediately after the conference Sir John French set out to ascertain the fate of his II. Corps, and, having learnt of the hard fighting which it had experienced at Le Cateau (*see* FRONTIERS, BATTLES OF: Sec. 5), he issued orders for the British army to fall back to the line La Fère–Noyon, and during the evening shifted his headquarters to the latter town.

From the evidence of his own published account it is clear that Sir John French felt strongly on two matters. The first was the action of the French V. Army on his right. He considered that the British had been placed in a position of isolation both at Mons and immediately afterwards "by the very sudden change of plan and headlong retirement of the V. Army." He had indeed pointed this out to Gen. Joffre, in the presence of Gen. Lanrezac, at the conference at St. Quentin. The other factor on which he had formed decided views was "the shattered condition of the troops which had fought at Le Cateau." In a further interview between the two commanders-in-chief on Aug. 27 Gen. Joffre showed himself most sympathetic and "understanding" in reference to the special position of the British, and promised that the French V. Army would be directed to take energetic action to take the pressure off it.

It was now the forenoon of the 27th, and the French V. Army, in accordance with Gen. Joffre's directive of the 25th, was retiring over the Oise above Guise; and orders had actually been drafted for the continuance of the retirement next day to the line Montcornet–Marles–Ribemont. Shortly before one o'clock on the 27th, however, an officer arrived from French general headquarters with verbal instructions to the effect that Gen. Lanrezac was at once to attack towards St. Quentin with vigour, "sans s'occuper des Anglais." As the V. Army was retiring almost due S., and in several columns, it would necessarily take some time to effect the change of front required for the offensive ordered, and this was pointed out to the envoy. The envoy made an irritating innuendo; a discussion of rather a tart nature ensued; Gen. Lanrezac's exasperation triumphed over his prudence, and he expressed himself rather freely on what he considered the indifferent work of French general headquarters.

Nightfall of the 27th found the French V. Army behind the Oise and Thon, with its left below Guise and its right about Rumigny, facing north-east. Before the offensive against St. Quentin could be carried out it was necessary to transfer the bulk of the army below Guise and to establish it opposite its objective; that is to say, facing west. This preliminary movement, which would entail a flank march within range of the enemy, and was further complicated by a change of front of more than a right angle, was undoubtedly a most delicate operation. A further difficulty was added by the fact that the Oise would give only a limited protection to the movement, inasmuch as it was not a serious obstacle above Guise. Again, the more the V. Army closed in to its left the wider would become the gap between it and the IV. Army on its right. These factors ruled out of court any prospect of an offensive before the 29th.

On the 28th the headquarters of the V. Army were at Marle, and there about noon Gen. Joffre came to see Gen. Lanrezac. The latter described to his chief the dispositions he was making, pointing out at the same time the exposed situation in which his right flank would find itself while his main body was committed to the offensive against St. Quentin. These observations do not appear to have been taken in good part by the commander-in-

GUISE, BATTLE OF (1914)

chief, who became very angry. He peremptorily ordered the V. Army commander to proceed with the offensive against St. Quentin; and *menaça le général Lanrezac de lui enlever son commandement.*

Before discussing the battle of Guise from the tactical point of view it is necessary to have a clear idea of the position of the forces engaged on either side. On the evening of the 27th the front of the V. Army from right to left was generally on the line Rumigny–Etreaupont–Guise–Origny St. Benoite. The main body, consisting of the I., X., III. and XVIII. Corps (in this order from right to left), lay between Aubenton and Guise, covered on the right by the reserve division of Gen. Bouttegourd and the cavalry of Gen. Abonneau, the latter being between Rumigny and Rozoy. On the left were two reserve divisions under Gen. Valabrègue holding the passages over the Oise at Guise and below that town. To bring about the transfer of strength to the left, and to effect the change of front required for the offensive ordered, orders were given for the following movements to take place on the 28th. Gen. Valabrègue was to close to his left and hold the left bank of the Oise S. of Moy. The III. and XVIII. Corps, each reënforced by an African div., were to take post along the Oise between Origny St. Benoite and Moy. The I. Corps was to move to Sains and form the army reserve. The X. Corps was to take post along the Oise E. of Guise. The cavalry of Gen. Abonneau, to which was to be attached the reserve division of Gen. Bouttegourd, was still to operate on the right. On the left of the French V. Army the British were, throughout the 28th, continuing their retirement, and by the evening of that day were on the line La Fère–Noyon, with a gap between the I. Corps on the right and the II. on the left.

To turn now to the Germans, the two armies likely to come into collision with the French V. Army were the I. and II., of which the former under Gen. von Kluck was on the right. After the battle of Le Cateau that army, by the evening of the 26th, was on the line Hermies–Crèvecœur–Caudry–Busigny, and by the evening of the following day it was, generally speaking, on the front Combles–Estrées. Unlike Gen. von Bülow, the commander of the I. Army was being affected by the heady atmosphere of optimism. The victory of Le Cateau obviously required following up, but a more grandiose scheme was selected, and Gen. von Kluck's one idea now seems to have been to march S.W. until he should overlap the Allied left. Accordingly on the 28th his army switched off from the pursuit of the British II. Corps, moved in the direction generally of Peronne, and by evening was in possession of the passages over the Somme between Feuillières and St. Christ. Thence he moved still S.W., becoming involved in fighting with French forces of Gens. d'Amade, Maunoury and Sordet, missing his chance of "eating up" the British II. Corps, and incidentally vanishing from the picture so far as the battle of Guise is concerned.

As for the German II. Army, on the evening of the 27th it was on the line St. Souplet–Wassigny–Etreux–Laschelle–Buironfosse–La Capelle, with its corps (working from right to left) disposed as follows:—VII. (less 13th Div.), X. Reserve, X. and Guard. During the day the order which had put the I. Army under the orders of the commander of the II. was cancelled by Supreme Headquarters, and Gen. von Bülow was beginning to feel somewhat isolated. On his right Gen. von Kluck had begun his eccentric march, while on the left the III. Army was being sucked eastwards to assist the IV. which was in difficulties. In these circumstances Gen. von Bülow at first determined to throw forward his right so as to keep touch with the I. Army, while keeping his left in position; but early on the 28th more favourable news from the III. Army on his left led him to order the X. and Guard Corps to cross the Oise. On this day Gen. Lanrezac was making a flank march behind that river, and changing front from north-east to west. Thus the French V. Army, from being in a position to get in its blow against St. Quentin, was likely to have its own right flank attacked by the II. Army of the Germans.

Gen. Lanrezac's orders for the attack on St. Quentin on the 29th were to the effect that while the X. Corps and Gen. Abonneau's cavalry should maintain their position, the main body (III. and XVIII. Corps) was to cross the Oise below Guise and march on St. Quentin, left in front, with orders to attack the enemy wherever found. Liaison officers brought the welcome intelligence that the British I. Corps would coöperate, and accordingly Gen. Lanrezac added a paragraph to his orders to the effect that the British I. Corps would debouch from Laon at 5 A.M. and move against St. Quentin. About 2 A.M. on the 29th, however, a telephone message was received to the effect that such coöperation was impossible, and accordingly Gen. Lanrezac ordered the reserve divisions of Gen. Valabrègue to flank the left of the XVIII. Corps.

At daybreak on the 29th the main body of the V. Army began to cross the Oise above and below Origny. For a time all went well, but at nine o'clock a telegram from the X. Corps announced the fact that it had been heavily attacked by German troops from the line Guise–Englancourt; in other words, by the German X. and Reserve Corps. The message went on to say that the left of the X. Corps was holding its own but that the right had been compelled to give ground. Gen. Lanrezac had again to modify his plan and to issue new orders, of which the tenor was as follows. The objective was still to be St. Quentin, but first of all the enemy attacking the X. Corps was to be thrown back over the Oise. The left flank was still to be protected by the reserve divisions of Gen. Valabrègue. The XVIII. Corps was to continue its advance towards St. Quentin but was to avoid serious engagements with superior forces. The III. Corps was to maintain its advanced troops W. of the Oise, so as to facilitate the eventual crossing of the river and the connexion with the XVIII. Corps on its left. The main body of the corps was, however, now to face N. and attack Guise. The X. Corps was to attack on the right of the III. Corps. The I. Corps now in reserve about Sains was to be ready to assist the X. Corps. The right flank was still to be protected by Gen. Abonneau's cavalry division.

It was, however, impossible to carry out this new plan, for by the time the orders had reached the various commanders the X. Corps had been driven back too far to allow of an attack upon St. Quentin. Gen. Lanrezac accordingly decided to renounce definitely all idea of attacking that place and to confine his efforts to dealing with the Germans who were harassing the X. Corps. To this end he issued the following order shortly before 11 A.M.:—

In view of the large number of Germans who have appeared E. of Guise the project of attacking St. Quentin is now renounced. It is now a question of defeating the enemy E. of Guise, and of either destroying him or at any rate of driving him back across the Oise. The XVIII. Corps and the Reserve Divisions of Gen. Valabrègue will mask St. Quentin, while the main body (III., X. and I. Corps) will make a determined attack to the north. Gen. Abonneau will leave a mixed detachment to maintain connexion with the IV. Army on the right and will then move the main bodies of his own cavalry division and of Gen. Bouttegourd's Reserve Division to Vervins ready to act against the enemy's left flank which has crossed the Oise W. of the Vervins–Avesnes road.

Gen. Joffre was present when the above instructions were drawn up, and gave them his tacit approval.

The French V. Army was now committed to two separate operations, in both of which the fighting was destined to be severe, for Gen. von Bülow had by now received definite orders from Supreme Headquarters to advance on Paris via the line Laon–La Fère. To take the fighting E. of Guise first, on the side of the Germans the Guard and X. Corps were facing the 21st Reserve Div., the X. and I. Corps and the 4th Div. of Cavalry, to which were subsequently added the bulk of the III. Corps. The German Guard Corps was operating from the line Etreaupont–Flavigny; the X. from Flavigny to Macquigny by Guise.

The morning of the 29th was ushered in by a thick mist which limited visibility for some time to three or four yards. The French X. Corps had been ordered to take Audigny, and accordingly the 20th Div. on the left moved forward against that village, while the 10th Div. followed in support on the right. The advanced guard of the 20th Div. entered Audigny, but was almost immediately attacked on its right flank, and after some

stubborn fighting the French effort to hold Audigny broke down; the fighting drifted back to the neighbourhood of Sains, and it was the intelligence of this set-back which led Gen. Lanrezac to give up the attack upon St. Quentin. The German Guard Corps was endeavouring to outflank the right of the X. Corps, and by three o'clock in the afternoon the situation for the French was distinctly unfavourable. Relief, however, was afforded partly by the action of Gen. Abonneau on the right, and still more by the intervention of the I. Corps, which came into action on the left and in front of the X. Corps and eventually got into touch with the III. Corps on the left and with Gen. Abonneau on the right. The situation of the French was now sensibly relieved as a result of the orders issued by Gen. Lanrezac about 11 A.M., and about five o'clock the general offensive prescribed therein took place along the 18 m. from Origny-Vervins towards Guise. Success crowned the efforts of the French. Bertaignemont, Clanlieu, Pusieux, Richaumont and Colonfay were retaken, and the Germans were driven back towards the Oise, although on their left they still held out stubbornly. During the night the two German corps fell back across the river.

This success was, however, neutralized by the events between the Oise and St. Quentin, where the situation took an unfavourable turn for the French. The reserve divisions of Gen. Valabrègue occupied Urviller, but were in turn attacked and forced to fall back behind the Oise. The leading units of the XVIII. Corps had meanwhile reached the neighbourhood of St. Quentin, but as its left was uncovered by the retirement of the reserve divisions Gen. de Las Latrie deemed it advisable to make preparations for a withdrawal of the XVIII. Corps to the Oise, an operation which was carried out by evening.

When morning broke on the 30th Gen. Lanrezac was under no illusions as to his position. The British army had been compelled to rest throughout the 29th on the line Noyon–La Fère, and was not likely to assume the offensive on the 30th; while on the right it was probable that the French IV. Army was again in retreat. If, therefore, the V. Army should remain during the 30th in the region Vervins–Guise–Ribemont it might find itself isolated with its flanks uncovered, and also forced to face simultaneously north, west and east. Gen. Lanrezac was prepared to take the risk, but in the evening of the 30th a telephonic message (apparently in confirmation of a written order which had gone astray) arrived directing the V. Army to fall back. The commander of the V. Army therefore issued orders for his troops to gain during what was left of the 30th the high ground N. of the lower Serre and Souche. This was carried out and by the 31st the V. Army was disposed in a great semicircle round Laon.

It is admitted that the French V. Army ably carried out its task of delaying the Germans; and Sir John French, writing of the battle later, said: "On the 29th (August) a very brilliant and successful attack by the French V. Army at Guise heavily defeated three German corps and threw them back with severe loss. This had a great effect in assisting the retreat, for it not only enabled the V. Army to hold its own for some time on the Oise, between Guise and La Fère, but it considerably relieved hostile pressure on the British and on the French troops on our left." Gen. Lanrezac, however, was apparently not in favour with French general headquarters, and within a few days he was relieved of his command. (F. E. W.*)

**GUITRY, LUCIEN GERMAIN** (1860– ), French actor (*see* 12.705). In 1920 he came to London, with his son Sacha, and made an immense success in *Pasteur*, playing himself the eminent scientist, and in his son's play *Mon Père avait Raison*.

SACHA GUITRY (1885– ), also a distinguished actor, was born at Petrograd. He was the author of a number of brilliant modern comedies, of which *Tel Père Tel Fils* (1909); *Nono* (1910); *Le Veilleur de Nuit* (1911); *La Prise de Berg-op-Zoom* (1912) are other examples. He married Yvonne Printemps, herself an actress of distinction. JEAN GUITRY, another son of Lucien Guitry, and a promising actor in modern comedies, was killed in a motor accident near Deauville Sept. 11 1920.

**GÜNTHER, ALBERT CHARLES LEWIS GOTTHILF** (1830–1914), German biologist, was born in Württemberg Oct. 3 1830 and educated at Tübingen, Berlin and Bonn universities. He entered the British Museum in 1856 and became keeper of the zoölogical department in 1875, holding that post for 20 years. He made a special study of fishes and reptiles, and published various works on the subject, as well as contributing a section of the article *Ichthyology* to the *E.B.* He received the gold medal of the Royal Society in 1878 and of the Linnean Society in 1904. He died at Kew Feb. 1 1914.

**GURKO, VASILI** (1864– ), Russian general, was born in 1864. He was educated in the Corps of Pages, and in 1885 was given a commission in the Grodno Hussar Regiment. On finishing his course at the Academy of the General Staff, he was appointed a general staff officer. During the S. African War of 1899–1902 he was one of the foreign military attachés on the Boer side. In the war with Japan 1904–5 he commanded a cavalry brigade and also served on the general staff. He distinguished himself and was promoted to the rank of general. Later he presided over the military-historic commission which in 1911 published "An account of the Russo-Japanese War" in seven volumes. In 1911 he was the chief of the 1st Cavalry div., with which in Aug. 1914 he advanced into Eastern Prussia. In 1915 he was the commander of the VI. Corps. His pronounced gifts and energy ensured his promotion. In 1916 he was commander of an army, and at the end of 1916, during Gen. Alexeiev's illness, he fulfilled the duties of chief of staff to the supreme commander-in-chief. Later, after the revolution, he was deprived of his appointment as commander-in-chief by Kerensky, owing both to his objections to risking an offensive with the army in its then condition of ferment and to his outspoken opinions as to the causes of this condition. Gurko was imprisoned, released, imprisoned again and finally sent out of Russia by way of Archangel, with his wife, who at once volunteered for service with the French Red Cross. She was killed in action at a dressing-station on the front on March 23 1918. General Gurko published his war memories (English edition) in 1918.

**GUSTAVUS V.** (1858– ), King of Sweden (*see* 12.738), succeeded his father on the throne in Dec. 1907. As Crown Prince he had interested himself greatly in sport and music, and he continued as King to patronize them. When the World War broke out in 1914 and neutral countries were impelled to take counsel together, King Gustavus took the statesmanlike action of inviting the kings of Norway and Denmark to a meeting at Malmö, and on a later occasion he himself journeyed to Christiania where he had once sat as regent. During the war he exerted himself personally to ensure the maintenance of a policy of honourable neutrality. His eldest son, the Crown Prince Gustavus Adolphus (b. 1882), also devoted much time and energy to sport, and interested himself in archaeology. The Crown Princess Margaret (b. 1882), a daughter of the Duke of Connaught, died on May 1 1920; she had won the love of the Swedish people, and when she died a fund of nearly 1,500,000 kronor was quickly subscribed to consecrate her memory. King Gustavus's brother, Prince Karl (b. 1861), was president of the Swedish Red Cross; and another brother, Prince Eugene, became known as a painter of much distinction.

**GUTHRIE, CHARLES JOHN GUTHRIE, BARON** (1849–1920), Scottish lawyer, was born at Edinburgh April 4 1849, the son of the Rev. Thomas Guthrie, editor of the *Sunday Magazine*. He was educated at Edinburgh Academy and University, and in 1875 was admitted to the Faculty of Advocates. He was from 1881 to 1900 legal adviser to the Church of Scotland, and in 1897 became a Q.C. In 1907 he was appointed a judge of the court of session and created a life peer. Lord Guthrie was a member of the royal commissions on historical monuments in Scotland (1908) and on divorce (1909), and was chairman of the houseletting commission (1906–7). From 1910 to 1919 he was president of the Boys' Brigade of Great Britain and Ireland, and was a member of various antiquarian societies. He had been in youth a friend of Robert Louis Stevenson, and published in 1914 an appreciation of "Cummy," Stevenson's nurse. His other works include *John Knox and his House* (1898), and an edition of Knox's *History of the Reformation in Scotland* (1898),

besides contributions to the memoir of his father, Thomas Guthrie (1875). He died at Edinburgh April 28 1920.

**GWALIOR, SIR MAHDO RAO SINDHIA,** MAHARAJA OF (1876– ), was born Oct. 20 1876, and succeeded his father, Sir Jayaji Rao Sindhia, in 1886 (*see* 12.748–9). He threw himself with the utmost keenness into the supervision of every detail of State management, endowing Gwalior with an excellent system of light railways, carrying out irrigation projects, husbanding the revenues and raising the standards of administration by unceasing vigilance. A great sportsman, on his visits to England for the coronations of 1902 and 1911 he delighted spectators at Hurlingham and elsewhere by his prowess in polo matches and other mounted sports. To his profound disappointment serious ill-health when the World War broke out prevented his service at the front; but he bent all his energies to helping the Allied cause. His two regiments and transport corps fought with distinction in France, East Africa, Egypt and Mesopotamia. A boundless and inventive generosity found scope in his constant presentation of munitions of war and princely donations to various relief funds. He took the main part in purchasing, equipping and maintaining the hospital ship "Loyalty," which carried 15,000 war patients; and provided a convalescent home at Nairobi in East Africa—to mention only a few of his gifts. He actively combated false and discouraging reports in India regarding the war. A lieutenant-general in the British army, and hon. colonel of 1st Duke of York's Own Lancers (Skinner's Horse), he was hon. A.D.C. to King George V., had the Grand Crosses of the Victorian Order, the Star of India and the British Empire; his permanent dynastic salute was raised to the maximum of 21 guns; and Oxford and Cambridge conferred upon him their hon. doctorates in law. King George V. also honoured him by becoming sponsor to his heir, George Jivaji Rao (b. 1916).

**GWATKIN, HENRY MELVILL** (1844–1916), English theological scholar, was born at Barrow-on-Soar, Leics., July 30 1844, the youngest son of the Rev. R. Gwatkin, formerly tutor at St. John's College, Cambridge. He was educated at Shrewsbury and St. John's College, Cambridge, where he graduated in theology in 1868, taking the Carus prize for Greek in 1865 and 1869, and the Tyrwhitt Hebrew prize in 1870. In 1868 he became a fellow of St. John's, and in 1874 theological lecturer. He succeeded Creighton as Dixie professor of ecclesiastical history at Cambridge (1891) and in 1903 gave the Gifford lectures at Edinburgh. He died at Cambridge Nov. 14 1916.

His chief works were *Studies of Arianism* (1882); *The Knowledge of God* (1906, the published version of his Gifford lectures) and *Early Church History* (1909).

**HAAG, CARL** (1820–1915), British painter (*see* 12.780*), died at Rother Thurm, Oberwesel, Jan. 17 1915.

**HAASE, FRIEDRICH** (1827–1911), German actor (*see* 12.782), died in Berlin March 17 1911.

**HAASE, HUGO** (1863–1919), German Independent Socialist leader, and one of the commission of six who conducted the Government of the German Reich in the name of the people immediately after the revolution of Nov. 1918, was born in 1863 at Allenstein in East Prussia. At the outbreak of the World War he was parliamentary leader of the Social Democratic party in the Reichstag, but in 1916 he seceded with the Independent Socialists, who refused to vote the estimate and war credits, and became their leader. In this capacity he exercised a moderating influence upon the extreme section of the Independents, who at a later date (1920) joined the Communists. Haase died on Nov. 7 1919 from wounds received in an attempt upon his life while he was entering the Reichstag building.

**HACKER, ARTHUR** (1858–1919), English painter, was born in London Sept. 25 1858, the son of Edward Hacker, a line engraver. He became a student at the Royal Academy schools in 1876, and from 1880–1 worked at the *atelier* Bonnat, Paris, subsequently travelling widely both in Europe and in North Africa. The best known of his paintings are "Her Daughter's Legacy," "The Mother," and "The Cloud," while his "Annunciation" (1892) was bought by the Chantrey trustees. He became A.R.A. in 1894 and R.A. in 1910. Hacker also became well known as a portrait painter. He died in London Nov. 12 1919.

**HADFIELD, SIR ROBERT ABBOTT,** 1ST BART. (1859– ), British metallurgist, was born at Sheffield Nov. 29 1859, and was educated at Sheffield collegiate school. At an early age he interested himself in metallurgy, and in particular carried out much research on the manufacture of steel. In 1883 he patented his process for the production of manganese steel (*see* 14.809), the first important known substance to combine great hardness with great malleability. From this time he became famous as the inventor or improver of various metallurgical processes. He was the inventor of low hysteresis steel, and also produced the "Era" steel for use in armour-plating, besides many special alloys. He became a member of many scientific committees, and was president of the Sheffield Metallurgical Society (1894–5), of the Iron and Steel Institute (1905–7), and of the Society of British Gas Industries (1917–8), besides being master cutler of Sheffield from 1899 to 1900. In 1908 he was knighted, and the following year became F.R.S. Sir Robert Hadfield received many honours from scientific and learned societies, including the Howard prize (1908), the Bessemer gold medal (1904), the Elliott Cresson gold medal (1910) and the John Fritz medal (1921) from various American societies. He was created a baronet in 1917.

**HADLEY, ARTHUR TWINING** (1856– ), American economist and educationist, was elected a director of the New York, New Haven & Hartford railway in 1913. In 1914 he lectured at the university of Oxford on "Institutions of the United States." In 1915 he evoked considerable discussion in America by declaring that young men who looked forward to a political career should have private means so as to avoid pecuniary temptations. In 1915 he endorsed college military camps and favoured counting military training for a degree. In 1920 he resigned as president of Yale University. The same year he was elected a director of the Atchison, Topeka & Santa Fé railway.

**HADOW, SIR WILLIAM HENRY** (1859– ), English scholar and musician, was born at Ebrington, Glos., Dec. 27 1859. He was educated at Malvern and Worcester College, Oxford, and after taking his degree remained at Oxford as a tutor and fellow of his college. In 1909 he became principal of Armstrong College, Newcastle, retaining this post until 1919, when he became vice-chancellor of Sheffield University. He was in 1918 appointed assistant director of education for the troops by the War Office, and also worked for the Y.M.C.A. He was knighted in 1918. Sir Henry Hadow is well known as a great authority on the history of music, and also composed many songs and pianoforte pieces, besides the incidental music to Robert Bridges' *Demeter* (1905). He published *Studies in Modern Music* (1894 and 1895); *Sonata Form* (1896); *A Croatian Composer* (1897); a valuable tract on Haydn and the source of many of his melodies and the section *The Viennese Period* (1904) in the *Oxford History of Music*, of which he was the editor.

**HAECKEL, ERNST HEINRICH** (1834–1919), German biologist (*see* 12.803), died at Jena Aug. 8 1919.

**HAGENBECK, CARL** (1844–1913), German wild-animal collector (*see* 12.814), died at Hamburg April 14 1913.

**HAGGARD, SIR HENRY RIDER** (1856– ), English novelist (*see* 12.816), was knighted in 1912. In the same year he was appointed a member of the royal commission to inquire into the natural resources and the improvement of the trade of the British Empire. He took a keen interest in the after-war settlement of ex-service men, and in 1916 visited the overseas dominions in that connexion. He was created K.B.E. in 1919. Among his later novels are *Child of Storm* (1913); *The Ivory Child* (1916); *Love Eternal* (1918); *The Ancient Allan* (1920).

**HAIG, DOUGLAS HAIG,** 1ST EARL (1861– ), British field-marshal, was born at Edinburgh on June 19 1861, son of John Haig of Cameronbridge, Fife. He was educated at Clifton and Brasenose College, Oxford, and in 1885 joined the 7th Hussars. He was promoted captain in 1891, afterwards passed through the Staff College, and was employed with the Egyptian army in 1898 during the Nile campaign, for which he was given a brevet majority. On the outbreak of hostilities in S. Africa in 1899, he went out to Natal on the staff and was present during the opening engagements near Ladysmith. He was afterwards chief staff officer of the cavalry division during Lord Roberts' victorious advance from Cape Colony through the Orange Free State into the Transvaal, and was promoted brevet lieutenant-colonel for his services. In the later phases of the struggle he was in command of a column and later was controlling groups of columns; at the close of the war he was appointed A.D.C. to the King, promoted brevet-colonel, and given the C.B.

Col. Haig subsequently commanded the 17th Lancers for a year, after which he went out to India as inspector-general of cavalry; this appointment he held until 1906, having been promoted major-general in 1905, in which year he married the Hon. Dorothy Vivian, daughter of the 3rd Lord Vivian. From 1906–9 he was a director in the War Office, and during this time he was intimately concerned in the development of the general staff and the improvements effected in the organization of the army, which were set on foot while Lord Haldane was Secretary of State. In 1907 he published a volume of *Cavalry Studies*. His next appointment was that of chief of the general staff in India, which he held for three years, being promoted lieutenant-general in 1910. In 1912 he was brought home to take the command in Aldershot, and in 1913 he was made a K.C.B.

On the mobilization of the Expeditionary Force in 1914, Sir D. Haig took the field as commander of the I. Army Corps, which he led during the Mons, Marne and Aisne operations, and the first battle of Ypres; he was promoted full general in November for his services. On the division of the B.E.F. into two armies at the beginning of 1915, he was placed at the head of the first. On the front of his army during 1915 there took place the battles of Neuve Chapelle, Festubert and Loos, and at the end of the year he succeeded Sir J. French in the chief command. He had been made a G.C.B. in the autumn.

The campaigns and battles of the British army in France under Sir Douglas Haig's command are dealt with elsewhere, and here it is sufficient to recall the names of the Somme, of Arras and the Hindenburg Line, of Messines and Ypres, of Cambrai, and finally the great disasters and greater triumphs of 1918. The culminating moment of all his work came on Sept.

28 1918, when, in conjunction with the American attack on the Meuse–Argonne front and the Belgian King's offensive from the Ypres–Yser lines, the British army broke through the Hindenburg Line between Cambrai and St. Quentin. It was after the success of Haig's attack on this front that the German military command made up its mind to yield, and its results were gleaned in a steady and triumphant advance along the whole British front up to the day of the Armistice.

For his great services he was raised to the peerage as Earl Haig of Bemersyde, and was given a grant of £100,000. The Order of Merit was also conferred upon him. He was appointed commander-in-chief in Great Britain after returning from the Continent, but he held the position for only a few months, as it was then abolished. Thereafter he devoted himself primarily to furthering the cause of the ex-soldier.

**HAINISCH, MICHAEL** (1856– ), Austrian official and writer, president of the Austrian Federal Republic from Dec. 8 1921, was born Aug. 15 1856. He was originally a lawyer and an official of the Treasury and of the Education Department, but retired to his estates in Lower Austria and Styria, where he carried on model farming, became a leader of the Austrian branch of the Fabian movement, and one of the founders of the Central People's Library. Holding aloof from political parties, he was chosen Federal president because of his personal authority, although he was not a member of Parliament, nor a candidate for the presidency. He was a fertile author of works on sociology and politics: *Zukunft der Oesterreicher* (1892); *Zur Wahlreform* (1895); *Kampf ums Dasein und Sozialpolitik* (1899); *Heimarbeit* (1906); *Fleischnot und Alpine Landwirtschaft*. Once a Radical Socialist, he became with advancing years a Conservative Agrarian. During the World War he introduced grain monopoly.

**HAITI** (*see* 12.824).—The all-important event in Haitian affairs in the ten years 1910–20 was the military intervention on the part of the United States, developing into a close political and fiscal protectorate. The first half of the decade was marked by constant revolutionary turmoil and by rapid political disintegration. In July 1911 President Simon was overthrown and on Aug. 14 1911 Cincinnatus Leconte, one of the foremost men of Haiti, became president. A year later (the night of Aug. 8 1912) the presidential palace was blown up and Leconte and a number of his followers killed. The National Assembly at once elected Tancrede Auguste, a prominent planter; he died the year after, and on May 4 1913 Senator Michel Oreste was elected to the presidency. December 1913 ushered in a period of political turbulence, and three military presidents assumed office in quick succession: Oreste Zamor, on Feb. 8 1914; Davilmar Theodore, on Nov. 7 1914; and Vilbrun Guillaume Sam, on March 4 1915. The last named, after withstanding the attacks of his opponents for several months, was compelled to seek refuge in the French legation in the night of July 26 1915, while two hundred political prisoners in the gaol of Port au Prince were massacred by order of one of his followers. At the funeral of the victims a party of mourners invaded the French legation, dragged out the ex-president, handing him over to the mob for death, and killed the ex-gaoler. Two hours later a U.S. cruiser arrived at Port au Prince and landed marines. U.S. forces occupied the country, disarmed the natives, and restored order;—and on Sept. 3 1915 Rear-Admi. Caperton, in command, declared martial law. Although U.S. naval officers assumed charge of most administrative functions, the Haitian governmental organization remained intact. On Aug. 12 1915 Sudre Dartiguenave was chosen by the Haitian Congress as president, and a treaty having been accepted by the Haitian Government, the U.S. Senate advised ratification Feb. 28 1916. Ratifications were exchanged at Washington May 3 1916, and the treaty was proclaimed on the same date. Modelled upon the American-Domingo Convention of 1907 (*see* 24.194), this instrument was designed to secure political stability and economic development in Haitian affairs by a political and fiscal protectorate, to remain in force for a period of 10 years. By its terms the president of Haiti appointed on the nomination of the president of the United States: (*a*) a general receiver of customs to take charge of the customs houses; (*b*) a financial adviser to be attached to the ministry of finance; (*c*) American officers to organize and command a Haitian constabulary (*gendarmerie*) which was to replace the Haitian armed forces, such officers to be later succeeded by qualified Haitians; (*d*) engineers to supervise public works and sanitation. Haiti agreed not to increase the public debt and not to modify the customs duties without the consent of the United States; the United States undertook to intervene when necessary for the preservation of Haitian independence and the maintenance of a stable and effective Government. The treaty provisions were promptly put into effect, and determined entirely the subsequent course of events.

Attention necessarily centred upon the establishment of civil order, and this was fully accomplished through an efficient native *gendarmerie*. Several hundred miles of much-needed roads had been constructed by 1921, and progress had been made in town sanitation. Fraud was eliminated from the customs houses, and dishonesty from national finances. On the other hand, friction grew out of the uncoördinated division of authority between the Haitian Government, the treaty officials and the military occupation. The nominal continuation of constitutional Government, superseded however in authority and operation by the military occupation, caused native irritation greater than complete military occupation for a probationary term might have been expected to develop. Charges that wide-spread atrocities were tolerated by American officials were made in 1920, but upon minute investigation resolved themselves into specific instances promptly corrected.

The future of Haiti presented in 1921 the gravest problem of American influence in the Caribbean. Early termination of military occupation was, in the opinion of those in responsible charge, certain to result in reversion to old conditions. On the other hand, public sentiment in the United States did not view with satisfaction the definitive abandonment of the one great opportunity left the negro race to demonstrate, even after repeated trial, an ultimate capacity for self-government. Until 1921 the establishment of civil order had engaged the best energies of the American officials. With this accomplished, opportunity seemed to be afforded for rendering the further offices contemplated by the treaty in a way conducive to the ultimate assumption of civil authority by the Haitian Government, subject only to those reservations as to political stability and fiscal solvency in force in other areas within the range of American influence in the Caribbean.

There has never been any reliable census of the population. The estimates vary from 1,500,000 to 2,500,000; the one most commonly accepted in 1920 was 2,000,000. Foreign trade for the year ending Sept. 30 1920 amounted to $46,388,443, of which $18,990,032 were exports and $27,398,411 were imports. Exports to the United States for this period were $9,903,881; to France, $6,531,252; to the United Kingdom, $318,120. Imports from the United States were $22,773,762; from France, $1,451,700; from the United Kingdom, $2,286,614. The chief articles of export for 1920 and their values were: cacao, crude, $606,801; coffee, $10,533,376; logwood and logwood extracts, $2,868,411; cotton, raw, $2,294,864; hides of cattle, $73,266; goatskins, $280,840; honey, $131,235; sugar, raw, $897,197; lignum-vitae, $114,923.

See "Reports and Inquiries regarding Conditions in Haiti" in *Annual Report of the Secretary of the Navy* (Washington 1920), Appendix C. For an extreme criticism of the American Occupation, see "Self-Determining Haiti," James Weldon Johnson, in the *Nation* (N.Y.), Aug. 28, Sept. 4 and 11 1920. (J. H. Ho.)

**HALDANE, RICHARD BURDON HALDANE, 1ST VISCT.** (1856– ), British statesman, philosopher and lawyer (*see* 12.832), was raised to the peerage in March 1911, while still Secretary of State for War; and he was appointed at the same time, on account of his eminence in the legal profession, a member of the Judicial Committee of the Privy Council. That eminence was further recognised, in June 1912, by his elevation to the woolsack in succession to Lord Loreburn. His six and a half years' tenure of the secretaryship for war had resulted in the fashioning of a small expeditionary force always ready for war, and in the creation of a territorial army, which was far more efficient than the old Volunteers. During his three years' occupancy of the Lord Chancellorship Lord Haldane presided over the highest court of appeal with dignity and efficiency. He did an unusual thing, as Chancellor, by leaving the country and putting the great seal in commission in the autumn of 1913, in order to go to Canada and address the Bar Association at Montreal.

In the years before the World War, he had come mainly before the public as the strong opponent of Lord Roberts' campaign for compulsory service, which would divert, he considered, money and attention from the navy, Britain's chief defence;

and as the apostle of better relations with Germany, a country which he knew well, which he regarded as his "spiritual home," and where he had many friends. While still Secretary of State, he made a mysterious journey to Berlin in Feb. 1912, at the direct invitation, it was said, of the Kaiser, whom he had entertained at lunch on his visit to England in the previous year. In Berlin he had conversations with William II. himself, and with the Chancellor and other ministers. Mr. Asquith at Cardiff, in the October after the war began, revealed the negotiations which passed with Germany in the year 1912—presumably at this visit. The British Cabinet formally assured the German Government that Britain would neither make, nor join in, any unprovoked attack on Germany. But the German Government asked Britain for an absolute pledge of neutrality if Germany were engaged in war—a demand which, of course, could not be conceded. After this rebuff Lord Haldane ceased to advocate in public a *rapprochement* with Germany; but he did not abandon his hopes, and the outbreak of war was for him a peculiarly bitter disappointment. He witnessed with legitimate satisfaction the smoothness and promptitude with which the expeditionary force he had done so much to equip was put in the field in France; but he regretted that Lord Kitchener preferred to create a new army rather than expand the Territorials. He sat on the War Council which Mr. Asquith created in Nov. 1914. But his association with the conduct of the war soon ended. The prejudice which his German affinities had raised against him in the public mind caused him to be left out of the first Coalition Ministry in 1915, and he did not return to office. His services to statesmanship and philosophy were recognized, on his retirement, by the bestowal of the Order of Merit.

After 1915 Lord Haldane ceased to take a prominent part in politics. So far as he intervened in them at all, he appeared to be moving from his old Liberal position and inclining rather to the Labour platform; so much so that it was currently reported that, if Labour formed a Ministry, he would be ready to hold the chancellorship in it. But he mainly occupied himself with his judicial duties as an ex-Chancellor, with the promotion of schemes for the improvement of national education, and above all with his philosophic studies. He published a comprehensive philosophical work, *The Reign of Relativity*, in 1921, on a subject which had occupied him for over 40 years; and he has told the world that the work was projected "on the day of my release from office as Lord Chancellor in 1915." It was natural that, when Prof. Einstein came to England in June 1921 to lecture on his revolutionary theory of relativity, he should be Lord Haldane's guest and lecture under Lord Haldane's chairmanship. Lord Haldane was chancellor of Bristol University, had held the rectorship of Edinburgh University, and been the recipient of many honorary degrees. (G. E. B.)

**HALE, GEORGE ELLERY** (1868– ), American astronomer, was born at Chicago, Ill., June 29 1868. He studied at the Harvard College Observatory and the Massachusetts Institute of Technology (B.S. 1890). He was director of the Kenwood Astrophysical Observatory; in Chicago, from 1890 to 1896. From 1892 to 1905 he was at the university of Chicago as associate professor of astrophysics, as professor (from 1897), and as director of the Yerkes Observatory (after 1895). In 1904 he became director of the Mount Wilson Solar Observatory (Cal.) of the Carnegie Institution of Washington. He invented the spectroheliograph first used in 1892 for photographing solar prominences and won an international reputation for his solar and stellar spectroscopic work. He was awarded the Janssen medal by the Paris Academy of Sciences in 1894, the Rumford medal by the American Academy in 1902, the Draper medal in 1903, a gold medal by the Royal Astronomical Society in 1904, the Bruce medal by the Astronomical Society of the Pacific in 1916, and the Janssen medal by the Astronomical Society of France in 1917. From 1892 to 1895 he was an editor of *Astronomy and Astrophysics* and thereafter of *The Astrophysical Journal*. He was the author of *The Study of Stellar Evolution* (1908) and *Ten Years' Work of a Mountain Observatory* (1915), besides numerous papers in the *Contributions* from the Mount Wilson Observatory and other scientific publications. He was a member of many learned societies at home and abroad.

**HALES, JOHN WESLEY** (1836–1914), British man of letters, was born at Ashby de la Zouch, Leics., Oct. 5 1836 and was educated at Louth grammar school, Glasgow high school, Durham grammar school, Glasgow University and Christ's College, Cambridge, which elected him to a fellowship. He was for some time an assistant master at Marlborough College under Dr. Bradley, as well as examiner at King's College, London, and the universities of Wales, New Zealand and Cambridge, and from 1889–93 Clark lecturer on English literature at Trinity College, Cambridge. Until 1903, when he retired, he was professor of English literature at King's College, London. He was general editor of Bell's *Handbooks of English Literature*, as well as editor of handbooks on *The Longer English Poems* (1872) and *Milton's Areopagitica* (1874), and co-editor of *Percy's Folio MS.* (1867–8). He wrote the introduction to Snell's *Age of Chaucer* and Seccombe and Allen's *Age of Shakespeare*, and contributed to the *Dict. of National Biography*. He died in London May 19 1914.

**HALIFAX, CHARLES LINDLEY WOOD, 2ND VISCOUNT** (1839– ), was born in London June 7 1839, and educated at Eton and Christ Church, Oxford. From 1862 to 1870 he was groom of the bedchamber to the Prince of Wales, and in 1885 succeeded his father in the title. In 1886 he became an ecclesiastical commissioner. He was well known as a strong High churchman, and for many years acted as president of the English Church Union.

**HALIFAX**, capital of Nova Scotia, Canada (*see* 12.843).—The pop. in 1918 was 63,000. The public buildings and many of the houses built of stone show a considerable taste in architecture. Much of this stone was brought from the dismantled homes and fortifications of Louisburg. About one-tenth of the city area was devastated by the explosion on Dec. 6 1917 of a French steamer, carrying 3,000 tons of T.N.T., on colliding with a Norwegian steamer on its way with a cargo of relief to Belgium. The reconstruction of a "Greater Halifax" was in 1921 being carried out on modern lines of town-planning.

During the World War Halifax and Sydney were the only two points of departure from which clearances were allowed by the British Admiralty for Imperial and Allied shipping. On the west side of the outside harbour the Federal Government had in progress the great work known as "the Halifax Ocean Terminals," of which several units are in operation. Within the pier head line 62 ac. will contain 27 berths prepared to accommodate ships up to 1,200 ft. in length. The depth at the piers at low water is 47 feet. The landing quays connect with the terminal passage station of the Canadian National railways. Grain elevators and conveyor systems will meet the needs of expanding commerce. Halifax claims to have the lowest port charges on the Atlantic coast. The principal exports are lumber, wood-pulp, fish, apples and flour; the imports sugar, tea, molasses and W. Indian fruits. In 1918 the imports were valued at $14,760,000 and the exports at $127,642,512. The entering and clearing tonnage rose from 3,111,535 tons in 1912 to 15,836,554 in 1919. The industrial establishments include the "Halifax Shipyards," iron foundries, a sugar refinery, rope and cordage works, cotton, chocolate, skate and furniture factories. Besides being the Atlantic terminus of the Canadian National railways, Halifax is the chief winter port of Canada, and is connected by steamship lines with Great Britain, Europe, Africa, South America, the West Indies, the United States, and by Panama Canal with the Pacific.

**HALLE, WILMA MARIA FRANCISCA, LADY** (MADAME NORMAN-NERUDA) (1839–1911), Anglo-German musician (*see* 12.853), died at Berlin April 15 1911.

**HALSBURY, HARDINGE STANLEY GIFFARD, 1ST EARL OF** (1823–1921), English lawyer and politician (*see* 12.867), died in London Dec. 11 1921. He was prominent as the leader of the "die-hard" section of the Conservative peers during the debates on the Parliament Act of 1911 (*see* ENGLISH HISTORY). The year of his birth, earlier given as 1825, was subsequently found to have been wrongly put two years too late, since the records of Merton College, Oxford, showed him to have been born on Sept. 3 1823.

**HAMBURG**, Germany (*see* 12.871).—Pop., according to the census of 1919, 1,050,359; in 1910, 1,014,664. The commerce, industry and shipping of Hamburg had constantly been increasing up to the outbreak of the World War, as was particularly manifested by the development of the Hamburg-Amerika line. That shipping company increased its capital in the year 1912 by 25 million marks (pre-war = £1,250,000), in order to deal with the constantly growing traffic. On April 3 1913 the Hamburg-Amerika line launched the s.s. "Vaterland," which was the greatest passenger steamship in the world. Again on Nov. 8 1913 it raised its capital from 150 to 180 million marks (£9,000,000). In its business controversies with the North German Lloyd, the Hamburg-Amerika line pursued the path of developing as rapidly as possible into the greatest German shipping company. Simultaneously the intellectual and commercial life of Hamburg were greatly quickened. In Jan. 1912 the elevated and underground railway was opened. In April 1911 the Hamburg Senate proposed the appointment of a committee of the *Bürgerschaft* (the representative assembly of the citizens) to consider the question of a university. A bill for the foundation of a university with three faculties was adopted by the Senate in Dec. 1912, but in Oct. 1913 was rejected by a majority of 80 against 73 by the *Bürgerschaft*.

The prosperous development of Hamburg was suddenly interrupted by the war. The 250th anniversary of the Chamber of Commerce was commemorated on Jan. 19 1915 under the shadow of economic decline. On April 18 1917 the *Bürgerschaft* had appointed a commission with a view to bringing about a reform of the class franchise which had hitherto existed in the Hanseatic cities (Hamburg, Bremen and Lübeck). A measure of electoral reform for Hamburg was adopted on June 11 1917. The city and territory nevertheless had as severe an experience of the revolutionary movement as any region in Germany. The Council of Workmen and Soldiers which had been set up in the first days of Nov. 1918 assumed complete political power on Nov. 13. The Council wanted to form a state of Great Hamburg by adding portions of Prussian territory. The region of Cuxhaven belonging to Hamburg declared its independence on Jan. 11 1919 under Spartacist (Communist) leadership. The republic of Cuxhaven, however, only lasted four days; it was overthrown on Jan. 15 by the officials, the state employees and the schoolmasters of Hamburg. At the end of Jan. and at the beginning of Feb. 1919, Communist disturbances broke out in the city itself; they were due in part to the occupation of Bremen by troops of the German *Reich*. For a brief period the Communist working classes of Hamburg remained under arms, but were altimately disarmed by the soldiers who had remained faithful to the Government of the *Reich*.

In those days of revolutionary tempest the university of Hamburg was founded on March 28 1918; a very democratic constitution was conferred upon it on Jan. 28 1921 by the law of the *Reich* dealing with the governing bodies of higher institutes of learning and scientific teaching (*Hochschulbehördengesetz*).

An election for the Hamburg *Bürgerschaft* took place on March 16 1919, when 81 Majority (moderate) Socialists, 13 Independent (extreme) Socialists, 33 Democrats, 14 members of the German People's party (old National Liberals), 13 representatives of the Economic League (lower middle class, tradesmen, etc.), and six members of the German National party (the old Conservatives) and the Catholic Centre were elected. The new constitution of Hamburg was adopted on Dec. 29 1920 by 95 votes against a minority of 40, consisting of the whole of the Right and the Communists.

This new constitution, which was adopted in a similar form in the other two Hanseatic cities (Bremen and Lübeck), reduced the Senate to the level of a democratic and parliamentary Government. The power which formerly emanated from the Senate now proceeds from the *Bürgerschaft*. The Senate is no longer elected for life, but is chosen on parliamentary grounds by the *Bürgerschaft*. The principle of a referendum was introduced into the constitution. The franchise is no longer confined to citizens of Hamburg, but is extended to all citizens of the *Reich* who may be present in Hamburg on the day of the election.

In accordance with provisions of the constitution of the *Reich* the new constitution of Hamburg shows itself to be an absolutely democratic, parliamentary system of Government. The *Bürgerschaft* (representative assembly) consists of 160 members, elected on the proportional system. The right to vote for the *Bürgerschaft* is acquired at the age of 20, the right to be elected to it at the age of 25; at the age of 30 any citizen is eligible for the Senate. In execution of the provisions of the constitution of the *Reich* a Labour council and an Economic council were formed for the representation of economic interests. Attempts to form a unified economic representation of the people failed. A feature of the old system of so-called "deputations" was retained for Hamburg in the shape of the Finance Deputation for dealing with finances of the city state.

(O. Ka.)

**HAMILTON, SIR IAN STANDISH MONTEITH** (1853– ), British general, was born at Corfu on Jan. 16 1853. He was educated at Wellington College and in Germany, and joined the army in 1872. He served with the 92nd Highlanders in the Afghan War and the Boer War of 1881, and was severely wounded on Majuba Hill, one arm being permanently disabled. He was then for several years intermittently on the staff of Sir F. (Lord) Roberts. He served in the Nile Expedition of 1884–5, for which he was promoted brevet major, and in Burma in 1886–7, for which he was promoted brevet lieutenant-colonel. In 1887 he married Jean, daughter of Sir John Muir, Bart. Promoted colonel in 1891, he was on the staff of the Chitral Relief Force in 1895, for his services in which he received the C.B., and he then became deputy quartermaster-general in India. He commanded a brigade on the North-West Frontier in 1897, and was afterwards commandant of the school of musketry, Hythe, for a year. On the outbreak of the South African War in 1899 he went to Natal on the staff. He commanded a brigade at the early engagements around Ladysmith and during its siege, and was promoted major-general; after its relief he commanded a mounted infantry division during Lord Roberts' advance from Bloemfontein to Pretoria and into the eastern Transvaal, for which he was made a K.C.B. He returned home early in 1901 to become military secretary at the War Office, but towards the end of the year went back to South Africa nominally as chief of the staff to Lord Kitchener, although in reality he was employed chiefly as the commander-in-chief's deputy to control particular groups of operations from time to time during the closing stages of the struggle. He was promoted lieutenant-general for his services.

He was afterwards again military secretary and then quartermaster-general at the War Office, and in 1904 he went out to the Far East to accompany the Japanese armies in the field. His diary and impressions of the Manchurian campaigns he published under the title *A Staff Officer's Scrap Book* (2 vols., 1906–7), a book which by reason of the interest of its subject, the charm of the author's style, and the combination of war experience and of imagination which inspired his judgments and criticisms, at once took rank in Europe as a modern military classic. On his return he had charge of the Southern Command until 1909, being promoted general in 1907, and he was afterwards adjutant-general at the War Office for a year. He took a prominent part on behalf of the voluntary service system during the early years of the Territorial Force and the campaign in favour of compulsory service led by Lord Roberts, and in the course of this controversy he published a book under the title *Compulsory Service* (1910), which he wrote at the request of Lord Haldane. In 1910 he was created G.C.B., and appointed commander-in-chief in the Mediterranean and inspector-general of the Overseas Forces, in which capacity he visited and inspected the newly organised forces of the Australian Commonwealth in 1913. On the outbreak of war in 1914 he served for some months as commander-in-chief of the Home Defence Army in England. Then, in March 1915, he was selected to take charge of the Mediterranean Expeditionary Force, which was intended to cooperate in opening a way into the Black Sea (*see* DARDANELLES CAMPAIGN). The naval effort to force the Dardanelles having failed, he found himself obliged to undertake operations in the Gallipoli Peninsula, and although his army was very ill-equipped for the task, he succeeded in landing it in the face of the enemy; but in spite of this good beginning he was speedily brought to a standstill. Having, after considerable delay, received substantial reinforcements, he made a great effort in Aug. to improve his position, but the operations failed to accomplish what was intended,

and a situation of stalemate arose. The Government consulted him in Oct. as to the expediency and feasibility of withdrawing from the peninsula, and on his pronouncing himself strongly opposed to such a policy he was replaced by Sir C. Monro and returned home. He was given the G.C.M.G. for his services. He was appointed lieutenant of the Tower of London in 1919, but retired from the army at the end of the year.

In 1920, after the issue of the report of the Dardanelles Commission, he published his own story of the campaign under the title of *Gallipoli Diary* (2 vols., 1920).

**HAMILTON,** Ontario, Canada (*see* 12.891), had in 1919 a pop. of 108,143. Hamilton's geographical position gives it excellent shipping facilities, and the city is on the direct line of main railways from Buffalo and Niagara Falls to Detroit and Port Huron; Buffalo and Niagara Falls to Montreal, and Detroit and Port Huron to Montreal. Hamilton has been called "the city of five hundred diversified industries," and has the largest plough works and implement works in the British Empire. Besides its Anglican and Roman Catholic cathedrals, the city has 83 churches, 33 banks, 51 schools (public, private and technical), five hospitals and three public libraries.

**HAMMANN, OTTO** (1852– ), German journalist and Foreign Office official, born Jan. 23 1852 at Blankenhain. He was engaged in journalism from 1877 to 1893 and was appointed, in 1894, Director of the Press Section of the German Foreign Office, a post which he continued to hold until 1916. Hammann was the trusted adviser of Prince Bülow, who always kept an attentive eye upon public opinion as reflected or created in the press. He had personally played a leading part in the defensive campaign of the Imperial Chancellor, Count Caprivi, and the Foreign Secretary, Baron Marshall von Bieberstein, in the early 'nineties, against the Bismarckian *fronde*. His business was to inspire the German and, as far as possible, the foreign press in a sense favourable to German policy and above all to obtain full and accurate information with regard to the personality and circumstances of journalists. His position enabled him to acquire a great deal of exclusive information with regard to the more secret ways of German policy and he embodied a considerable portion of what he knew in the three volumes of reminiscences which he published after the Revolution, *Der neue Kurs, Erinnerungen* (1918); *Zur Vorgeschichte des Weltkriegs* and *Um den Kaiser, Erinnerungen aus den Jahren 1906–1909* (1919).

**HAMMARSKJÖLD, HJALMAR** (1862– ), Swedish statesman, was born in 1862, and educated at Upsala University, where he became professor of civil law. He gradually established his reputation as a jurist, and took a prominent part in national politics. In 1901 he joined von Otter's Ministry, and was Minister of Justice till it resigned in 1902. In the latter year he was elected president of the Göta High Court. In 1905 he joined Lundeberg's Government, formed after the dissolution of the union with Norway, as Minister of Education. He was one of Sweden's four representatives in the negotiations with Norway at Karlstad. After the resignation of the Lundeberg Government he became, in Nov. 1905, Swedish Minister in Copenhagen, and in 1907 governor (*landshövding*) of the province (*län*) of Upsala. He had often acted meanwhile as expert in constitutional law on behalf both of Sweden and of other countries. He was Swedish delegate at the international conference in Paris with regard to literary copyright in 1896, and at the Hague conferences in regard to private international law in 1900 and 1904. From 1904 he was Swedish member of the Hague International Board of Arbitration, and in 1907 he was Sweden's leading delegate to the Hague Peace Conference. In 1908 he was appointed member of the Board of Arbitration in regard to the question of the sea boundary between Sweden and Norway, and in the same year he acted as president of the Franco-German Board of Arbitration in regard to the Casablanca affair. He was chairman of the Swedish committee for drafting the Swedish-German treaty of commerce in 1910–1; Swedish delegate at the Spitzbergen conferences of 1910 and 1912; in 1909 juridical adviser in the Swedish-Norwegian Board of Arbitration in regard to the right of Swedish Laplanders to graze their reindeer in Norway; and in 1913 president of the Franco-Italian Board of Arbitration for the solution of certain freight disputes. In Feb. 1914 he succeeded Staaff as prime minister, retaining this post during the World War until 1917.

**HANKOW,** China (*see* 12.919).—At the mouth of the Han river a great commercial entrepôt is provided for China by the three large cities, Hankow, Hanyang and Wuchang, at the point where the Han flows into the Yangtsze. Prior to the commencement of disorder in 1911 the development of railway communications in the interior of China had largely increased the wealth and importance of this great distributing centre. Hankow, on the N. bank of the Yangtsze, is the terminus of the completed Peking-Hankow trunk line, and Wuchang, on the S. bank, the terminus of the line, in process of construction, from Canton. But during the turmoil of the revolution, and on more than one occasion thereafter, Hankow suffered materially because of its strategical importance to the contending factions. On Nov. 1 1911 two-thirds of the city was destroyed by fire as the result of a bombardment by the imperialists; nevertheless, the population of the three cities united was reckoned by the Maritime Customs in 1916 at 1,321,280 and in 1920 at about 1,500,000.

The black-tea trade, Hankow's staple industry in former days, declined steadily between 1915 and 1920, partly because of the competition of Indian and Ceylon teas, but chiefly because of the elimination of the Russian buyer—the total amount of black leaf shipped abroad from China in 1919 being 288,398 piculs, as against 771,141 piculs in 1915. But in other directions the trade of the port expanded steadily, in spite of political excursions and alarms; its net value in 1919 was 200 million taels, as against 170 millions in 1917. The industrial development of the district, increasingly active after the conclusion of the World War, was reflected in a large demand for machinery and plant for new factories. In 1919 Hankow-milled yarn was selling at a higher price than yarn imported from Japan. The export trade in wood-oil and sesamum-seed, of which Hankow is the chief centre, increased very rapidly.

The number of residents in the British Concession recorded by the census of 1920 included 163 British and 341 Japanese out of a total of 678. The German Concession, like that at Tientsin, was taken over by the Chinese authorities after China's declaration of war on the side of the Allies; early in 1920 it was understood that Japan was negotiating with the Chinese Government to acquire it by purchase.

(J. O. P. B.)

**HANN, JULIUS VON** (1839–1921), Austrian meteorologist, was born at Linz, Upper Austria, March 23 1839, and was educated at the *Gymnasium* of Kremünster and afterwards at Vienna. From 1865 to 1868 he was master at the *Oberrealschule* at Linz, and in 1865 was appointed editor of the *Zeitschrift für Meteorologie*. In 1877 he became director of the *Meteorologische Zentralanstalt* and professor of meteorology at the university of Vienna. In 1897 he was appointed professor at Graz, but in 1900 returned to Vienna as professor of cosmical physics. His meteorological researches were of the greatest value and importance (*see* 18.266, 286). His published works include *Allgemeine Erdkunde* (with F. von Hochstetter and A. Pokorny, 1872; 5th ed. 1896); *Handbuch der Klimatologie* (1883; latest ed. 1908); and *Lehrbuch der Meteorologie* (1901; latest ed. 1914), besides numerous meteorological papers contributed to the *Sitzungsberichte der Kaiserlichen Akademie der Wissenschaften* in Vienna. Dr. Hann was in 1912 made a foreign knight of the Prussian *Ordre Pour le Mérite*. He celebrated the jubilee of his doctorate in 1918, and died at Vienna Oct. 1 1921.

**HANOTAUX, ALBERT AUGUSTE GABRIEL** (1853– ), French statesman and historian (*see* 12.923), was active during the World War as historian and propagandist, producing *Histoire de la Guerre de 1914* (9 vols., 1914); *Le Traité de Versailles* (1919) and *Histoire de la Nation française* (17 vols., 1920). He was employed on more than one semi-official mission abroad, notably to the Vatican, and in 1921 was the third French delegate on the League of Nations.

**HARA, TAKASHI** (1856–1921), Japanese statesman, was born at Morioka in Feb. 1856. His early studies were made at the now defunct Law College of the Department of Justice, but he abandoned the law, before graduating, in favour of journalism, joining the staff of the *Hochi Shimbun*, an important Tokyo daily newspaper. He acted as special correspondent in Korea in 1882, when the late Marquess Inouye was envoy to that country,

**HAMBURG**, Germany (*see* 12.871).—Pop., according to the census of 1919, 1,050,359; in 1910, 1,014,664. The commerce, industry and shipping of Hamburg had constantly been increasing up to the outbreak of the World War, as was particularly manifested by the development of the Hamburg-Amerika line. That shipping company increased its capital in the year 1912 by 25 million marks (pre-war = £1,250,000), in order to deal with the constantly growing traffic. On April 3 1913 the Hamburg-Amerika line launched the s.s. "Vaterland," which was the greatest passenger steamship in the world. Again on Nov. 8 1913 it raised its capital from 150 to 180 million marks (£9,000,000). In its business controversies with the North German Lloyd, the Hamburg-Amerika line pursued the path of developing as rapidly as possible into the greatest German shipping company. Simultaneously the intellectual and commercial life of Hamburg were greatly quickened. In Jan. 1912 the elevated and underground railway was opened. In April 1911 the Hamburg Senate proposed the appointment of a committee of the *Bürgerschaft* (the representative assembly of the citizens) to consider the question of a university. A bill for the foundation of a university with three faculties was adopted by the Senate in Dec. 1912, but in Oct. 1913 was rejected by a majority of 80 against 73 by the *Bürgerschaft*.

The prosperous development of Hamburg was suddenly interrupted by the war. The 250th anniversary of the Chamber of Commerce was commemorated on Jan. 19 1915 under the shadow of economic decline. On April 18 1917 the *Bürgerschaft* had appointed a commission with a view to bringing about a reform of the class franchise which had hitherto existed in the Hanseatic cities (Hamburg, Bremen and Lübeck). A measure of electoral reform for Hamburg was adopted on June 11 1917. The city and territory nevertheless had as severe an experience of the revolutionary movement as any region in Germany. The Council of Workmen and Soldiers which had been set up in the first days of Nov. 1918 assumed complete political power on Nov. 13. The Council wanted to form a state of Great Hamburg by adding portions of Prussian territory. The region of Cuxhaven belonging to Hamburg declared its independence on Jan. 11 1919 under Spartacist (Communist) leadership. The republic of Cuxhaven, however, only lasted four days; it was overthrown on Jan. 15 by the officials, the state employees and the schoolmasters of Hamburg. At the end of Jan. and at the beginning of Feb. 1919, Communist disturbances broke out in the city itself; they were due in part to the occupation of Bremen by troops of the German *Reich*. For a brief period the Communist working classes of Hamburg remained under arms, but were altimately disarmed by the soldiers who had remained faithful to the Government of the *Reich*.

In those days of revolutionary tempest the university of Hamburg was founded on March 28 1918; a very democratic constitution was conferred upon it on Jan. 28 1921 by the law of the *Reich* dealing with the governing bodies of higher institutes of learning and scientific teaching (*Hochschulbehördengesetz*).

An election for the Hamburg *Bürgerschaft* took place on March 16 1919, when 81 Majority (moderate) Socialists, 13 Independent (extreme) Socialists, 33 Democrats, 14 members of the German People's party (old National Liberals), 13 representatives of the Economic League (lower middle class, tradesmen, etc.), and six members of the German National party (the old Conservatives) and the Catholic Centre were elected. The new constitution of Hamburg was adopted on Dec. 29 1920 by 95 votes against a minority of 40, consisting of the whole of the Right and the Communists.

This new constitution, which was adopted in a similar form in the other two Hanseatic cities (Bremen and Lübeck), reduced the Senate to the level of a democratic and parliamentary Government. The power which formerly emanated from the Senate now proceeds from the *Bürgerschaft*. The Senate is no longer elected for life, but is chosen on parliamentary grounds by the *Bürgerschaft*. The principle of a referendum was introduced into the constitution. The franchise is no longer confined to citizens of Hamburg, but is extended to all citizens of the *Reich* who may be present in Hamburg on the day of the election.

In accordance with provisions of the constitution of the *Reich* the new constitution of Hamburg shows itself to be an absolutely democratic, parliamentary system of Government. The *Bürgerschaft* (representative assembly) consists of 160 members, elected on the proportional system. The right to vote for the *Bürgerschaft* is acquired at the age of 20, the right to be elected to it at the age of 25; at the age of 30 any citizen is eligible for the Senate. In execution of the provisions of the constitution of the *Reich* a Labour council and an Economic council were formed for the representation of economic interests. Attempts to form a unified economic representation of the people failed. A feature of the old system of so-called "deputations" was retained for Hamburg in the shape of the Finance Deputation for dealing with finances of the city state.

(O. Ka.)

**HAMILTON, SIR IAN STANDISH MONTEITH** (1853– ), British general, was born at Corfu on Jan. 16 1853. He was educated at Wellington College and in Germany, and joined the army in 1872. He served with the 92nd Highlanders in the Afghan War and the Boer War of 1881, and was severely wounded on Majuba Hill, one arm being permanently disabled. He was then for several years intermittently on the staff of Sir F. (Lord) Roberts. He served in the Nile Expedition of 1884–5, for which he was promoted brevet major, and in Burma in 1886–7, for which he was promoted brevet lieutenant-colonel. In 1887 he married Jean, daughter of Sir John Muir, Bart. Promoted colonel in 1891, he was on the staff of the Chitral Relief Force in 1895, for his services in which he received the C.B., and he then became deputy quartermaster-general in India. He commanded a brigade on the North-West Frontier in 1897, and was afterwards commandant of the school of musketry, Hythe, for a year. On the outbreak of the South African War in 1899 he went to Natal on the staff. He commanded a brigade at the early engagements around Ladysmith and during its siege, and was promoted major-general; after its relief he commanded a mounted infantry division during Lord Roberts' advance from Bloemfontein to Pretoria and into the eastern Transvaal, for which he was made a K.C.B. He returned home early in 1901 to become military secretary at the War Office, but towards the end of the year went back to South Africa nominally as chief of the staff to Lord Kitchener, although in reality he was employed chiefly as the commander-in-chief's deputy to control particular groups of operations from time to time during the closing stages of the struggle. He was promoted lieutenant-general for his services.

He was afterwards again military secretary and then quartermaster-general at the War Office, and in 1904 he went out to the Far East to accompany the Japanese armies in the field. His diary and impressions of the Manchurian campaigns he published under the title *A Staff Officer's Scrap Book* (2 vols., 1906–7), a book which by reason of the interest of its subject, the charm of the author's style, and the combination of war experience and of imagination which inspired his judgments and criticisms, at once took rank in Europe as a modern military classic. On his return he had charge of the Southern Command until 1909, being promoted general in 1907, and he was afterwards adjutant-general at the War Office for a year. He took a prominent part on behalf of the voluntary service system during the early years of the Territorial Force and the campaign in favour of compulsory service led by Lord Roberts, and in the course of this controversy he published a book under the title *Compulsory Service* (1910), which he wrote at the request of Lord Haldane. In 1910 he was created G.C.B., and appointed commander-in-chief in the Mediterranean and inspector-general of the Overseas Forces, in which capacity he visited and inspected the newly organised forces of the Australian Commonwealth in 1913. On the outbreak of war in 1914 he served for some months as commander-in-chief of the Home Defence Army in England. Then, in March 1915, he was selected to take charge of the Mediterranean Expeditionary Force, which was intended to cooperate in opening a way into the Black Sea (*see* DARDANELLES CAMPAIGN). The naval effort to force the Dardanelles having failed, he found himself obliged to undertake operations in the Gallipoli Peninsula, and although his army was very ill-equipped for the task, he succeeded in landing it in the face of the enemy; but in spite of this good beginning he was speedily brought to a standstill. Having, after considerable delay, received substantial reinforcements, he made a great effort in Aug. to improve his position, but the operations failed to accomplish what was intended,

opposed all tendencies toward internationalism. He supported the Knox resolution declaring that war with Germany was ended.

At the Republican National Convention in 1920 he was not at first among the prominent candidates for president. On the first ballot he received 65½ votes (493 being necessary for choice), 39 of these being from his own state. On the eighth ballot he received 133½ votes, on the ninth 374½ votes, and on the tenth he secured the nomination with 692½ votes, the result being due largely to the support of certain influential U.S. Senators, delegates to the convention, who hoped that as president he would be amenable to the Senate. He did not "stump" the country, but conducted his campaign from the "front porch" of his own home. Mr. Harding based his campaign chiefly upon criticism of the Wilson administration, denouncing especially the excessive power that, as he maintained, had been exercised by the executive as a result of war centralization; he demanded as speedy as possible a return to normal conditions, political and industrial. While opposing the Covenant of the League of Nations, he gave to many of his supporters the impression that he desired an "association of nations" which, without the characteristics of a super-state (such as he believed the League to be), might safeguard peace. But he retained the political support of many who were opposed, like Senators Borah and Johnson, to any sort of international association. In the November elections he won an overwhelming victory over James M. Cox, the Democratic nominee, also from Ohio; he carried, generally by immense majorities, all the northern states and all but one of the states on the border between North and South, and he cut down materially the Democratic majorities in the South. The electoral vote was 404 for Harding against 127 for Cox. The popular vote was 16,138,000 for Harding against 9,142,000 for Cox. In Ohio the popular vote was 1,182,000 for Harding against 780,000 for Cox. The sweeping character of his victory was due less to his own personal strength or to the weakness of Cox than to the national reaction against the Democratic party and the popular feeling against President Wilson. Mr. Harding resigned from the U.S. Senate in Dec. 1920, and was inaugurated March 4 1921, the sixth President to come from Ohio.

The promise frequently made by Republican campaign leaders that Mr. Harding would surround himself with advisers of capacity and experience, seemed to be fulfilled by his choice of Cabinet members. The outstanding names were those of Charles E. Hughes and Herbert C. Hoover, who became Secretary of State and of Commerce respectively. The distinguished career of the former and the widespread confidence in his ability and political integrity had marked him for the most important position in the Cabinet; and there had been a general demand that the new administration should utilize the organizing ability displayed by Hoover in many fields. Various elements in the Republican party, nevertheless, had stoutly opposed their appointment, so that the President's choice showed that he was prepared to exert his independence of party managers and to insist upon administrative efficiency. The choice of Andrew W. Mellon, a wealthy banker and ironmaster of Pittsburgh, as Secretary of the Treasury, was welcomed by men of business; and though that of Will H. Hays to be Postmaster-General was in the nature of payment of a political debt to the man who had been the successful manager of the Republican campaign, it was early justified by his efficient administration of the postal service. Mr. Harding's inaugural address, and his first message to Congress, delivered in person on April 12, voiced his desire to return to "normalcy," as he expressed it. Retrenchment in expenditure formed a major item in his programme, together with a prompt and thorough revision of taxation. He advocated the adoption of a national budget system, and, Congress having passed a budget bill similar to that vetoed by Mr. Wilson in 1920, he approved it on June 10 1921; it provided for a Budget Bureau in the Treasury Department and the appointment of a director of the budget, the first being Charles G. Dawes, formerly general purchasing agent of the American Expeditionary Force. President Harding's first budget was presented Dec. 5 1921. The President was insistent upon the need of repealing the excess profits taxes and reducing transportation taxes and income surtaxes. The need of financial retrenchment led to his opposing the proposal that war veterans should receive a cash bonus. In this matter, as in others, he proved his ability at this early stage to resist political pressure. As regards the tariff he advocated, as a temporary stop-gap, the passing of the emergency tariff, which had been vetoed by President Wilson, but which with slight alteration was approved by Mr. Harding on May 27 1921. He urged the need of adopting a permanent tariff policy, and on Dec. 5 1921 suggested a "flexible tariff" which might provide for the adjustment of rates to meet unusual and changing conditions. Such adjustments might be made, in his opinion, by the executive on the advice of the Tariff Commission. Mr. Harding's interest in agricultural problems was keen; in his first message he asked special protection for agricultural interests, and in his second he declared that something more than protection must be given the farmers, advocating warmly the encouragement of coöperative marketing plans. As regards domestic legislation, the President, in general, assumed the rôle of moderator. He disclaimed any desire to enlarge the powers and responsibilities of the executive, which, he declared, were already too large; and he aimed at close coöperation with Congress. In marked contrast to his predecessor, he left administrative responsibility to the members of his Cabinet. Foreign policy was largely determined by Hughes, financial by Mellon, and the problem of unemployment was thrown upon Hoover. The President, however, frequently played an active rôle in the conferences necessary to secure general agreement, as on Aug. 9 1921 when an accord was reached between the Treasury and the Representatives on the taxation plan.

The foreign policy of the administration at first seemed likely to emphasize independence of action, in contradistinction to that of President Wilson; the threatened war between Panama and Costa Rica was prevented by a sharp note from Secretary Hughes; the claims of the Japanese to a mandate over Yap were stoutly denied; the administration refused to follow Great Britain in resuming trade relations with Soviet Russia. President Harding made plain in his first message that the United States would not enter the League of Nations. But he expressed himself warmly in favour of active coöperation with other nations of the world, and by accepting the invitation to participate in inter-Allied councils indicated that he would avoid a policy of isolation. In rejecting the League Covenant, he said "we make no surrender of our hope and aim for an association to promote peace, in which we would most heartily join." The President advocated a declaration of peace with Germany by resolution, and the immediate negotiation of a treaty. This policy was adopted by Congress, which agreed upon a joint peace resolution, signed by him on July 2. On Aug. 25 1921, a treaty with Germany was signed, embodying the President's plan of including most of the stipulations of the Versailles Treaty, but repudiating adherence by the United States to any clause referring to the League of Nations. This treaty and similar pacts with Austria and Hungary were ratified by the Senate, Oct. 18 1921.

The most important step taken by President Harding during the first year of his administration was the calling of an international conference on the limitation of armaments. On May 25 1921 the Senate had adopted an amendment of Senator Borah to the Navy bill, authorizing and inviting the President to call such a conference. Mr. Harding's preliminary invitations to the principal naval Powers (Great Britain, Japan, France and Italy) were sent July 10, and formal invitations Aug. 11. He made clear his belief that the question was closely connected with the problems of the Pacific and Far East, and invitations were also sent accordingly to China and to the smaller European powers with Far-Eastern interests—Holland, Belgium and Portugal. The invitations were accepted, and the conference assembled at Washington on Nov. 12. President Harding avoided the example set by his predecessor, and did not himself participate as a delegate. He displayed his political tact in the choice of the American delegation, which was led by Secretary Hughes and included, besides Elihu Root, two members of the Senate, Lodge

and Underwood, the Republican and Democratic leaders respectively. The policy drafted by the President and Mr. Hughes was direct and vigorous. They refused to permit the vital problem of limitation of armaments to be side-tracked, and surprised the conference by proposing a ten-year naval holiday and a drastic scrapping of tonnage by the three chief naval Powers. The President made it clear that he regarded the conference merely as a step in securing international understanding and good will; he advocated the convening of succeeding conferences as a possible means of securing an international association for the promotion of peace, and he approved the principle of substituting an understanding between the United States, Great Britain, France and Japan regarding Far-Eastern problems, for the existing Anglo-Japanese Treaty. (*See* WASHINGTON CONFERENCE.)

The initiative taken by President Harding in calling the conference, and the extent of its success, intensified the feeling which had been steadily growing during the first session of his administration, that he possessed qualities peculiarly adapted to the political conditions of the moment. He had faced difficult problems with independence and yet he had been able to inaugurate something of an "era of good feeling." His "gospel of understanding" had proved effective both in domestic and foreign politics. (C. SEY.)

**HARDINGE OF PENSHURST, CHARLES HARDINGE,** 1ST BARON (1858– ), British diplomat, was born in London June 20 1858, second son of the 2nd Viscount Hardinge. He was educated at Eton and Trinity College, Cambridge, and in 1880 entered the diplomatic service. He became secretary of legation at Teheran in 1896, and in 1898 went to St. Petersburg as secretary of embassy. In 1903 he returned to England and became Assistant Under-Secretary for Foreign Affairs, becoming later (1906-10) Permanent Under-Secretary. In the latter capacity he accompanied King Edward VII. on his foreign visits. He was created K.C.M.G. in 1904 and G.C.M.G. in 1905. From 1904 to 1906 Sir Charles Hardinge was ambassador to Russia, and in 1910 was appointed Viceroy of India and raised to the peerage. On Dec. 22 1912, a bomb was thrown at him as he entered the city of Delhi in state, seriously wounding him, besides killing an attendant. It fell to Lord Hardinge's lot to welcome King George V. and Queen Mary on their historic visit to India in the winter of 1911–2. Lord Hardinge returned to England in 1916 and was reappointed to the post of Permanent Under-Secretary of Foreign Affairs, retiring in 1918. In Nov. 1920 he succeeded Lord Derby as ambassador in Paris.

Lord Hardinge married in 1890 the Hon. Winifred Selina Sturt, daughter of the 1st Baron Alington. Lady Hardinge did much during her husband's period as Viceroy of India to further the medical training of Indian women. She escaped unhurt when her husband was wounded at Delhi, but the resulting shock to her nerves did much to hasten her death in London July 11 1914.

**HARDY, THOMAS** (1840– ) English novelist (*see* 12.946); in more recent years received increasing recognition, not only as the premier living English novelist but as a poet. His poetical play *The Dynasts*, recounting in dramatic form the epic of England's struggle against Napoleon with an accompaniment of philosophic comment after the manner of the Greek tragedians, was produced at the Kingsway theatre, London, in the early months of the World War, and again at Oxford in 1920. He published *Satires of Circumstance* (1914); *Selected Poems* (1916); *Moments of Vision* (1917); and his *Collected Poems* appeared in 1919. His first wife died in 1912, and in 1914 he married Florence Emily, daughter of Edward Dugdale, herself a writer of children's books and articles in periodicals. Both on his 70th and on his 80th birthdays he received tributes of respect and admiration from literary and public men throughout the English-speaking world.

**HARE, SIR JOHN** (1844–1921) English actor (*see* 12.948), played the Judge in Barrie's *The Adored One* at the Duke of York's theatre in 1913, and made his latest appearance on the stage in a revival of Grundy's *A Pair of Spectacles* at Wyndham's theatre in 1917. He died in London Dec. 28 1921.

**HARLAN, JOHN MARSHALL** (1833–1911), American jurist (*see* 12.954), died in Washington, D.C., Oct. 14 1911, after a service on the Supreme Court of just short of 34 years.

**HARPIGNIES, HENRI** (1819–1916) French painter (*see* 23.15), of whose drawings there was an exhibition in London in March 1910, died in Burgundy Aug. 23 1916.

**HARRIGAN, EDWARD** (1845–1911), American actor (*see* 13.17), died in Brooklyn, N.Y., June 6 1911.

**HARRISON, FREDERIC** (1831– ), English jurist and historian (*see* 13.23), published his *Autobiography* in 1911. Other more recent volumes from him were *Among my Books* (1912); *The Positive Evolution of Religion* (1912); *The German Peril* (1915); *On Society* (1918) and *Obiter Dicta* (1919). The last was a collection of vigorous comments on politics and literature contributed by him to the *Fortnightly Review* throughout the closing year of the World War. These comments, though then in his 90th year, he resumed as *Novissima Verba* throughout 1920.

One of his sons, AUSTIN HARRISON (b. March 27 1873), became editor of *The English Review* in 1910. He was the author of *The Pan-Germanic Doctrine* (1904) and other works on Germany's foreign policy.

**HART, SIR ROBERT,** BART. (1835–1911), Anglo-Chinese statesman (*see* 13.30), left China in July 1907 after 45 years of service as inspector-general of the Imperial Maritime Customs. A year before his feelings had been hurt and his authority diminished in the eyes of the customs service, by the action of the Chinese Government in appointing high Chinese officials to be "administrators" of the service, with control over the inspector-general and his staff; and although the Peking authorities made partial amends for the discourtesy thus shown him, by declining his resignation and by increasing his titular rank while on leave of absence, the remaining years of his life were undoubtedly affected by recollection of the lack of appreciation thus displayed by those whom he had served so long and so loyally. After 50 years of residence at Peking and complete absorption in Chinese affairs, a life of enforced leisure in England had a depressing effect upon his spirits and his health. The book which he wrote, after the Boxer rising, in 1901, remains his only published work; he declined to write his memoirs, and by his will left instructions to his executors which apparently preclude all hope of his voluminous diaries being used for biographical or historical purposes. Despite the disappointments of his later career, Sir Robert Hart left a name in China whose greatness will endure; his life's work stands out against the confused background of Chinese affairs as that of one who combined the qualities of an administrator with something of the poetic temperament and the mind of a speculative philosopher, a figure as picturesque in its way as that of Gordon or Cecil Rhodes. The multifarious activities of his career were reflected by the large number of honours and decorations conferred upon him by European sovereigns, rulers and learned societies; at the time of his death, he was the possessor of 13 grand crosses. By imperial edicts every high honour in the gift of the Chinese throne had been bestowed upon him, including the Double Dragon and the Peacock's Feather. He was a junior guardian of the heir-apparent, and his ancestors had been retrospectively ennobled for three generations. He died at Great Marlow on Sept. 20 1911. (J. O. P. B.)

**HARTLEY, SIR CHARLES AUGUSTUS** (1825–1915), English engineer (*see* 13.35), died in London Feb. 20 1915.

**HARTLEY, JONATHAN SCOTT** (1845–1912), American sculptor (*see* 13.35), died in New York City Dec. 6 1912. Among his last exhibits were "Young Hopi Stick Thrower" (1911) and "The Cradle of Pan" (1912).

**HARVARD UNIVERSITY** (*see* 13.38).—The history of Harvard University, after 1909, when Abbott Lawrence Lowell succeeded Charles William Eliot as president, continued to be one of change and growth to meet new needs and opportunities.

*Buildings.*—Three residence halls for freshmen—Gore, Standish and Smith—accommodating about 450 men, built near the Charles river at a cost of approximately $2,500,000, were opened in 1914; and in 1919–20 a number of other dormitories, originally

erected by private enterprise, were purchased by the university, thus largely increasing the residence halls under its control. Two new chemical laboratories, the Walcott Gibbs and the Thomas Jefferson Coolidge, Jun., Memorial, were opened in 1913–4, and proved a welcome addition to the university's equipment for teaching and research; and in the following year an addition to the Peabody Museum was first occupied, thus completing the university's museum buildings as originally planned by Louis Agassiz in 1859. A building for the music department and the Cruft high-tension laboratory were also opened in 1914–5. In 1915 the Widener Library was first available. This building was erected by his mother, in memory of Harry Elkins Widener, of the class of 1907, who lost his life in the "Titanic"; it is probably the most successful as it is the largest of college library buildings. The Germanic Museum, intended to exhibit the evidences of Germanic civilization in the widest sense, was completed and opened in 1921. Improvements have been made in athletic fields, gymnasia, etc.

*Endowments.*—The period under consideration was the most remarkable in the history of the university for the rapid increase of funds. In spite of the World War, graduates and friends gave approximately $17,000,000 in the decade from 1909 to 1919. Approximately $5,000,000 of this was for buildings and immediate use; $12,000,000 for permanent endowment. With the close of the war the alumni revived a project, started before the war but suspended, to secure additional endowment, and organized in the summer of 1919 a committee of graduates for the purpose. Up to June 30 something over $13,780,000 had been subscribed, of which over $8,500,000 had at that time been paid into the treasury. The total productive endowment of Harvard University then approximated $48,000,000.

*The College.*—In 1910–1 a new plan of admission to Harvard College was put into operation, which endeavours to test the intellectual condition of the applicant for admission and to establish a closer coöperation with preparatory and high school authorities; experience has shown that the plan in fact does secure closer articulation, especially with public schools, and that it provides the college with a better grade of student. In 1920 over 40% of the freshmen class entered from public schools. In its essential features the "new plan" has been adopted by at least six other important colleges. The free elective system, which furnished little or no direction to a student's choice of studies, was modified in 1910 so as to require each student to choose enough courses in some one field of knowledge to enable him actually to gain considerable knowledge of that subject; and also to distribute a certain number of courses among other fundamental subjects, so that a more systematic and well-rounded education might be secured. At the same time the "degree with distinction" was established for high attainment in general, coupled with distinguished success in the subject to which the student has given most attention. Ordinarily the candidate is obliged to pass a special examination near the end of his senior year to obtain this degree. Beginning with 1916 general final examinations on the student's field of concentration were introduced in the departments of history, government and economics for all students, whether candidates for distinction or not, and this plan is about to be extended to most departments. Experience has shown that such an examination for the degree encourages the student to think of his chief subject as a whole, and to read independently in his field; it gives an opportunity to test the student's capacity at the end of his course; and it has resulted in increased interest on the part of the students and in a higher grade of scholarship.

*Engineering School.*—In 1915–6, after the Massachusetts Institute of Technology had decided to move from Boston to Cambridge, all instruction in engineering was virtually transferred to it under a coöperative agreement entered upon between the Institute and Harvard. Since there was some doubt, however, as to whether such coöperation was allowed under the terms of the large Gordon McKay bequest which was given to Harvard University to further applied science, application was made by the university authorities to the Supreme Court of Massachusetts for a judgment in the matter. The decision of the Court in 1917 made it necessary to abandon the coöperative plan, and Harvard University again established a school of Engineering Sciences, which, in spite of conditions caused by the war, made a successful beginning, and in 1920–1 had 24 instructors and 214 students.

*The Graduate Schools.*—The period under review has also been marked by constant developments in the graduate schools of the university.

The Graduate School of Arts and Sciences had steadily grown in numbers until [illegible] by the war, and by 1920 was rapidly recovering its losses. The students in this school mostly prepare for careers as teachers and scholars; and in spite of the economic disadvantages under which the profession of teaching labours, it is impossible to meet all the requests coming to the school for teachers and research workers. The preparation which the Graduate School of Business Administration is giving young men for the scientific management of business has won wide appreciation and is causing large resort to the school—442 in 1920–1. In the Law School a post-graduate year of study has been established, leading to the degree of S.J.D., which is intended especially for men who wish to prepare themselves for teaching law and for research in jurisprudence. In 1919–21 the number both of faculty and students largely increased. In the Medical School new departments of pharmacology, of tropical medicine and industrial medicine have been established. Affiliation with hospitals, many of which are now grouped near the school, and changes in the faculty have secured the largest and strongest organization for teaching of medicine and for medical research in the United States. New degrees of Master of Theological Science (S.T.M.) and Doctor of Theology (Th.D.) have been established for those who wish to continue their studies after obtaining the ordinary degree, and the ordinary degree itself (S.T.B.) is now given on the basis of a general examination at the end of the student's three-year course.

*University Extension.*—Since 1909 Harvard University has united with Boston University, Boston College, the Massachusetts Institute of Technology, Simmons College, Tufts College, Wellesley College, and the Museum of Fine Arts in offering courses in university extension. These courses are given ordinarily in Boston to a considerable number of students each winter (1,785 in 1920–1).

*World War Services.*—Ten thousand Harvard graduates and students entered the army or navy of the United States during the conflict; of these 70% received commissions. No complete records exist of those who engaged in non-military service, but it may safely be said that over half the Harvard men of every age took an active part during the war. The Roll of Honour contains 372 names of men who gave their lives.

Preparation for the possible entrance of the United States into the war began early at the university, and large numbers of students and graduates attended the successive Plattsburg camps. Beginning with 1915, courses in military training were given regularly in the college. In Feb. 1916 the Harvard regiment was formed by undergraduates and trained by regular and volunteer officers; the next year the Reserve Officers' Training Corps came into existence, and early in 1917 President Lowell, through the French embassy, arranged for the visit of six wounded French officers to train the students. In the summer of 1917 the Government sent a picked group of 550 newly commissioned officers to study under these French officers at Harvard. After the United States entered the war intensive military training was begun and the academic work of the year correspondingly abbreviated. Large numbers of the teaching force entered the service both abroad and in the United States, while the student body quickly shrank to those who either because under age or physically defective were unfit for military service. During the autumn of 1918, when the Government established the Students' Army Training Corps at the university, training was furnished for the army, the navy and the marine corps to some 1,989 students. The equipment of the university in electrical engineering led to the establishment in May 1917 of a Radio school, which, originally planned for a few hundred, rapidly grew until it contained about 5,000 men. Special quarters were erected on open ground and the Cambridge Common was occupied by temporary dormitories. The university also provided quarters for the Officer Material school, which trained ensigns for the navy. As early as 1915 the generosity of a group of graduates made it possible to send out the first Harvard medical unit to assist the Allies. Successive units followed, until in 1917 a Harvard unit under Dr. Hugh Cabot joined the English forces for the duration of the war.

The number of students in 1920–1 was as follows:—

| | |
|---|---|
| College | 2,532 |
| Graduate School of Arts and Sciences | 532 |
| Special students | 77 |
| Engineering School | 214 |
| Graduate School of Business Administration | 442 |
| Architecture | 66 |
| Bussey Institution | 15 |
| Divinity School | 53 |
| Law School | 944 |
| Graduate School of Education | 121 |
| Medical School | 439 |
| Dental School | 232 |
| Summer schools of 1920 | 2,077 |
| School of Public Health | 31 |
| (330 deducted for duplication) | |
| Total | 7,445 |

In 1908–9 the corresponding total was 5,250. The number of officers of instruction and administration in 1920–1 was 891; in 1908–9, 743. The total number of volumes and pamphlets in the

university library in 1920 was over 2,000,000. The number of students at Radcliffe College (for women) in 1920–1 was 652.

(C. H. M.)

**HARVEY, GEORGE** (1864– ), American editor and diplomat, was born at Peacham, Vt., Feb. 16 1864, and was educated at the Peacham academy. At the age of 18 he became a reporter on the *Springfield* (Mass.) *Republican* and later on the New York *World*. In 1885 he was appointed by Gov. Green of New Jersey as aide-de-camp on his staff, and was reappointed by Gov. Abbett. The latter also made him insurance commissioner of New Jersey in 1890. During 1891–4 he was managing editor of the New York *World*. Then for several years he was engaged in the construction of electric railways and in 1898 organized a syndicate which secured possession of the lines in Havana, Cuba. The following year he purchased *The North American Review*, which he thereafter edited for several years. During 1900–15 he was president of the publishing house of Harper & Bros., and during 1902–13 was editor of *Harper's Weekly*. In 1903 he purchased the *Metropolitan Magazine*. He was said to have been the first to suggest (in 1906) Woodrow Wilson, then president of Princeton, as a presidential possibility. In the campaign of 1912 he gave Wilson strong support; but after the latter's nomination an estrangement developed, due, as it was generally understood, to the fact that Wilson intimated that his cause was being jeopardized by Harvey's officiousness. In 1916 Harvey urged the election of Charles E. Hughes, the Republican candidate for president. He was strongly opposed to the League of Nations on the ground that it involved the yielding of national sovereignty. In 1918 he established *The North American Review's War Weekly*, later called *Harvey's Weekly*, which bitterly denounced the Wilson administration. He was present at the Republican National Convention of 1920, but not as a delegate, and was influential in the nomination of Senator Harding. In 1921 he was appointed ambassador to England by President Harding.

He was the author of *The Power of Tolerance, and Other Speeches* (1911).

**HARVEY, SIR JOHN MARTIN** (1867– ), English actor, was born at Wyvenhoe in Essex June 22 1867, and was educated at King's College school, London. He was intended for a naval architect, but took to the stage, and appeared first in 1881 at the age of fourteen in a boy's part at the Court theatre, London. Next year he was engaged by Irving at the Lyceum and remained in his company for fourteen years, playing minor parts in London but leading parts during summer tours. In 1898 he played Pelleas in Maeterlinck's *Pelleas and Melisande*, and in 1899 he entered into management with *The Only Way*, an adaptation of Dickens's *Tale of Two Cities*, in which he scored a great success. Other successes were in *A Cigarette-Maker's Romance* and *The Breed of the Treshams*. In later years he was active in promoting the production of Shakespearean plays, both in London and in the provinces, playing the leading parts himself, and he was the King in Reinhardt's production of *Œdipus Rex* at Covent Garden Jan. 1912. He married Angelita Helena de Silva, herself an actress and exponent of Shakespearean heroines. He was knighted Jan. 1 1921. During the World War Sir John Martin Harvey delivered a large number of recruiting lectures on Sunday evenings in leading theatres throughout the United Kingdom, beginning in Sept. 1914. By collections made there and elsewhere, by himself and Lady Harvey, he raised sums for the British Red Cross, and for wounded soldiers, nurses and other sufferers by the war,—amounting in all to about £25,000.

**HAUCK, ALBERT** (1845– ), German theologian, was born at Hassertrüdingen, M.-Franken, Dec. 9 1845, and was educated at the gymnasium at Ansbach and later (1864–8) at the universities of Erlangen and Berlin. He took orders, and from 1873–8 was pastor at Frankenheim. In 1882 he became professor of theology at Erlangen, and in 1889 proceeded to Leipzig, where he was professor until 1898, and then for a year rector of the university. His published work includes *Tertullian's Leben und Schriften* (1877) and the *Kirchengeschichte Deutschlands* (5 vols., 1887–1911).

**HAUPTMANN, GERHART** (1862– ), German dramatist (*see* 13.68), hardly added to his reputation as a dramatist after 1900. He produced *Kaiser Karls Geisel* (1908); *Griselda* (1909); *Die Ratten* (1910), the latter in his earlier realistic manner; *Gabriel Schillings Flucht* (1912); *Der Bogen des Odysseus* (1914) and *Winterballade* (1917). His novels include *Emanuel Quint* (1911), *Atlantis* (1912) and *Der Ketzer von Soana* (1918). A complete edition of Hauptmann's works was published in Berlin in six volumes (1912).

See C. Höll, *Gerhart Hauptmann*, etc., (1913); W. Bonsels, *Das junge Deutschland und der grosse Krieg, aus Anlass des Briefwechsels Romain Rollands mit G. Hauptmann über den Krieg und die Kultur* (1914); A. Espey, *G. Hauptmann und wir Deutschen* (1916); P. A. W. Gaude, *Das Odysseusthema bei Hauptmann* (1916); J. H. Marschan, *Das Mitleid bei G. Hauptmann* (with bibliography, 1919).

His elder brother, CARL HAUPTMANN (1858–1921), also an author, was born at Ober-Salzbrunn, Silesia, May 11 1858. He was educated at the Realschule, Breslau, and at the university of Jena, where he studied physical science and philosophy under Haeckel. He was afterwards a pupil of Avenarius and Forel at Zürich, and his first published work, *Die Metaphysik in der modernen Physiologie* (1893), shows their influence. He returned to Silesia about 1890 and devoted himself thenceforward to literature, publishing a very large number of dramas, poems, novels and tales of peasant life in the Riesengebirge. Amongst his novels may be mentioned *Mathilde* (1902) and *Einhart der Lächler* (1907), and amongst his dramas *Ephraim Breils* (1898), *Die Bergschmiede* (1901) and *Napoleon* (in two parts, 1906). He died in Berlin Feb. 3 1921.

See *Carl Hauptmann*, by Hans Heinrich Borcherdt (1911).

**HAVANA**, Cuba (*see* 13.76).—The pop. of Havana, according to the census of 1919, was 360,527, an increase of more than 20% over that of 12 years earlier. During the 10 years previous to 1918, 295,320 immigrants reached Cuba through the port of Havana. Within recent years the city has undergone a radical change. Modern pavements, scientific sanitation and 20th-century discipline of every sort have helped to make it a thriving, healthful, vigorous city in keeping with its commercial and industrial importance. Motor-cars swarm the streets, which are greatly congested, especially in the older section where they are very narrow. This condition will be relieved, it is hoped, by the construction of a subway, plans for which were prepared early in 1921. The estimated cost was about $10,000,000.

The police corps of Havana was said to be one of the most efficient organizations of the republic. The fire department was also well organized and the most modern fire-fighting apparatus had been recently installed. In keeping with the general prosperity of the island, a great deal of building went on in Havana of fine private residences, luxurious club-houses and modern hotels, the last to care for the large number of American tourists. The most noteworthy public building completed in recent years was the new presidential palace, built at a cost of nearly $5,000,000, and opened Jan. 31 1920. Situated most impressively on the Avenida de las Palmas, it is said to be one of the handsomest palaces built in modern times. Among the noteworthy developments in educational lines was the establishment in Havana in 1920 of a Spanish-American branch of the College of Business Administration of Boston University. The university of Havana had nearly 1,600 students in 1919, an increase of about 190% over the enrolment 12 years before.

Havana is the chief centre of trade for the island and nearly all important commercial companies and banks have their main offices located there. More merchandise enters and leaves this port than any other on the western hemisphere except New York. At almost any time there can be seen in the harbour ships that represent nearly the entire world. About 75% of the imports of Cuba are handled here, though a considerably smaller proportion of the exports, which are shipped from the many lesser ports near various producing centres. In 1919 the total customs receipts for the island were $44,405,325, of which $33,733,955 were collected at Havana. In 1920 the receipts at Havana reached the record sum of $32,300,997, in comparison with $17,922,092 ten years before. Japan in 1919 established a direct line of steamships between Yokohama and Havana via the Panama Canal.

The All American Cables, Inc., obtained four permits in 1920 to land cables on the Cuban coast, two of which were to enter Havana, one from the United States and the other from Mexico or the Central American coast. A telephone cable between Havana and Key West has been completed, making possible telephone communication between Cuba and any part of the United States. Early tests proved conversation between New York and Havana to be as easy as between New York and Washington. Early in 1921 port conditions (*see* CUBA) were materially improved.

(W. R. Ma.)

**HAVERFIELD** (BALGUY), **EVELINA** (1867–1920), English war hospital worker, daughter of the 3rd Baron Abinger, was born Aug. 9 1867. She married Maj. Haverfield, R.A., in 1887, and *en secondes noces* Gen. Balguy in 1899. A keen sportswoman, she collected abandoned troop horses on the veldt during the Boer War and nursed them back to good condition. She was among the first London women-suffragists to be sentenced to imprisonment and organized a branch of the Women's Social and Political Union. She was one of the original members of the Women's Emergency Corps in Aug. 1914, founded and organized the Women's Volunteer Reserve, and was commandant-in-chief of the Women's Reserve Ambulance (Green Cross Corps). In April 1915 she went to Serbia as administrator of the Scottish Women's hospital unit at Valjevo, and remained with Dr. Elsie Inglis working for the Serbs as prisoners of the enemy from Nov. to Feb. 1916. In Aug. 1916 she went to Russia in charge of the transport column of Dr. Inglis's unit. On her return in Nov. 1917 she organized a comforts fund for the Serbian army, which became a fund for disabled men and their dependents after the Armistice. In Aug. 1919 she went to Serbia as hon. sec. of this fund and as commissioner for the Serbian Red Cross Society in Great Britain. At her instigation her friends at home raised another fund for Serbian children, with which she established an orphanage at Baiyna Bachta, on the borders of Bosnia, and there she succumbed to pneumonia brought on by fatigue and exposure March 21 1920. She received the Order of St. Sava, classes IV. and V., St. George's medal for bravery under fire, and a Russian medal, class II., for meritorious service. The Order of the White Eagle was posthumously bestowed.

**HAVERFIELD, FRANCIS JOHN** (1860–1919), English historian and archaeologist, was born at Shipston-on-Stour Nov. 8 1860. He was educated at Winchester and New College, Oxford, and after some years as a schoolmaster was appointed tutor of Christ Church, Oxford, in 1891, and official student in 1893. He became a great authority on the history and antiquities of Roman Britain and was entrusted by Mommsen with the editing of the British section of the *Corpus Inscriptionum* (*see* 18.683). In 1907 he was elected Camden professor of ancient history at Oxford. He was a fellow of the British Academy and a member of the Royal Commission on Ancient Monuments, England; he was also first president of the Society for the Promotion of Roman Studies. He died at Oxford Sept. 1 1919. Amongst his publications were *The Romanization of Roman Britain* (3rd ed. 1915); *Ancient Town Planning* (1913) and many monographs on Roman history.

**HAWAII** (*see* 13.83).—In 1920 the pop., exclusive of military and naval forces, was 255,912, an increase of 64,003, or 33·4%, over that of 1910. It was distributed by race as follows: Hawaiian, 23,723; part-Hawaiian, 18,027; Portuguese, 27,002; Porto Rican, 5,602; Spanish, 2,430; other Caucasian, mostly American, 19,708; Japanese, 109,274; Chinese, 23,507; Filipino, 21,031; Korean, 4,950; Negro, 348; all others, 310. The distribution by islands was as follows: Oahu, 123,496; Hawaii, 64,895; Maui, 36,080; Kauai, 29,247; Molokai, 1,784; Niihau, 191; Lanai, 185; Midway, 31; Kahoolawe, 3. The pop. of Honolulu, the capital, was 83,327, an increase of 59·7% over that of 1910. That of the second city in size, Hilo, was 10,431.

Males numbered 151,146, or 59·1%, and females 104,766, or 40·9%, the corresponding percentages in 1910 being 64·1 and 35·9. The excess of males is chiefly among adults, but since the cessation of Japanese, Chinese and Korean labour immigration there has been a constant tendency towards normal sex and age ratios. The Hawaiians continue to decrease, but at a diminishing rate. The decrease for 1910–20 was 2,318, or 8·9%, as compared with a decrease of 3,746, or 12·58% for 1900–10. The part-Hawaiians, however, are increasing more rapidly than the Hawaiians are decreasing. Their increase for the last decade was 3,521, or 44·15%, and for the preceding decade, 4,658, or 59·35%. The death-rate of Hawaiians and the birth-rate of part-Hawaiians are the greatest among all races. The Hawaiians apparently are destined to disappear through intermarriage with other races rather than by deaths. They intermarry chiefly with Caucasians and Chinese. Each of these crosses, especially the latter, produces a good stock. The Japanese alone remains are the extremists in preserving racial solidarity.

[illegible] ration has been occasioned chiefly by the rapid growth of [illegible] since 1878. Much of it has been of assisted Latin and [illegible] unskilled labourers. Many of these, under improved conditions, become sooner or later skilled labourers, and their children, with the advantages of education, seldom engage as unskilled labourers. Hence the constant need of replenishing the supply. The last immigration assisted by the Government was in 1906–12, and consisted of 5,288 Spanish, 4,962 Portuguese and 2,056 Russians. Since then the only assisted immigration has been of Filipinos, introduced by the sugar producers. The number of these in the territory increased from 2,318 in 1910 to 21,031 in 1920. The increase in population, apart from this assisted Filipino immigration and a small but steady unassisted Anglo-Saxon immigration, is now mainly through births. There has been some emigration of Portuguese, Spanish, Filipinos, Russians and Japanese to California.

Chinese immigration, restricted previously, has been prohibited since 1898; the Chinese decreased from 25,762 in 1900 to 21,674 in 1910, but increased to 23,507 in 1920, indicating that this race has now established itself on a basis of natural increase, notwithstanding the abnormally small number of Chinese women and the tendency of Chinese men to intermarry with Hawaiian women. Japanese arrivals have exceeded departures since the "gentlemen's agreement" of 1907 between the United States and Japan, but the arrivals have been in large part women unknown to their future husbands, the so-called "picture brides," and not only has the largest increase in any race in recent years been of Japanese through births, but this race now constitutes by far the largest element in the population. Their increase in 1910–20 was 29,599, or 37·15%, as compared with 18,559, or 30·37%, for the preceding decade. For the year ended June 30 1920 Japanese births numbered 4,963, and deaths 1,596, as compared with 5,202 births and 2,968 deaths for all other races. The rapid increase in the number of Japanese who are native born and therefore American citizens presents the most important problem for the future. Comparatively few of these have yet arrived at voting age. The increase in Portuguese was 4,701 for the last decade and 6,628 for the preceding decade. The increase in Caucasians other than Latins, and exclusive of military and naval forces, was 4,841 for 1910–20 and 4,290 for 1900–10. These were mainly Americans, but with a considerable British element, and in 1921 they constituted the dominant element in the social and industrial life of Hawaii.

*Industries and Commerce.*—The remarkable prosperity which Hawaii enjoyed previous to 1910 continued during the decade 1910–20. The number of banks increased from 11 in 1910 to 26 in 1920, and their deposits from $13,324,305.54 to $52,783,114.04. The assessed value of taxable property increased from $150,268,467 to $287,006,792; exports increased from $47,029,631 to $145,831,074, and imports from $26,152,435 to $68,876,094. Trade is chiefly with the mainland of the United States, $142,246,003 of the exports, and $59,261,621 of the imports in 1920; while $3,585,071 of the exports and $9,614,473 of the imports were with foreign countries. The exports named in order of value comprised sugar, $118,998,848, canned pineapples, $18,869,449, fruits and nuts, coffee, molasses, hides, canned fish, rice, honey, wood, sisal and tallow. The imports from the United States comprised a wide range of articles while those from foreign countries were in large part food supplies from Japan, bags from India and nitrates from Chile. The sugar industry continues to be by far the largest. It grew rapidly until 1911, but since then comparatively little land has been available for further expansion. The largest crop, that of the crop year ending Sept. 30, 1915, amounted to 646,445 short tons. This industry is conducted mostly on a large scale by corporations, which own the mills and raise on land owned or leased by them most of the cane they grind. The capital stock is widely distributed. The yield per acre is larger than in any other country, about five tons of sugar per acre on the average, the irrigated land yielding about 70% more per acre than the unirrigated. On some fields a new variety of cane is yielding 12½ tons of sugar per acre. About half the acreage is irrigated by conduits from mountain streams, storage reservoirs and pumping from artesian and surface wells. The most recently constructed large irrigated project, completed in 1916, consists of about 25 m. of concrete-lined tunnels and ditches and steel pipe 6 ft. in diameter, the longest tunnel extending 2·76 m., for conducting water from the rainy windward to the arid leeward side of the island of Oahu. The employees, of many nationalities, on the sugar plantations number about 45,000. These, besides receiving house, fuel, water and medical attendance free, are paid a monthly basic wage and a bonus which varies with the price of sugar. In 1920 the minimum monthly basic wage—that is, for the lowest class of labour—was $20, and the bonus, extraordinarily large, was 276% of the wages. For 1921 the minimum monthly basic wage was $30. Much has been done to improve the living conditions of employees by replacing tenements with cottages and garden space, providing hospitals, entertainment halls and motion-pictures, playgrounds, kindergartens, social-service workers, and by improving sanitary conditions generally.

The canned pineapple industry has had a remarkable growth. It is an industry of the present century. During the first decade the pack increased from practically nothing to 544,968 cases per year, while during the second decade it increased to 5,978,064 cases, or 143,473,536 two-pound cans, valued at approximately $31,000,000, for 1920. One of the factories is the largest fruit cannery in the world and has attained a maximum output of 777,371 cans in a day. About 46,000 ac. of land are devoted to this industry.

While Hawaii exports and imports more of what it produces and consumes than most other countries, there is nevertheless considerable farming for subsistence, and several industries, such as the live-stock and fishing industries, figure largely in local trade. Much has been done since 1895 to promote homesteading of public lands, but with small success. During 1910–20 2,650 homesteads were taken up, covering an area of about 55,000 ac., at prices aggregating about $1,500,000, which was probably about a third of the actual value. The most striking feature in Hawaii's industries as well as that which has contributed most to their success, is the extent to which science is applied, not only by the individual industrial concerns but also through such more general agencies as the sugar planters' association's experiment station, the university of Hawaii, the territorial bureau of agriculture and forestry and the U.S. experiment station.

Although Hawaii is essentially an agricultural country, the principal agricultural industries are such as require much manufacturing, not only directly, as in sugar, rice and coffee in mills and fruit and fish in canneries, but also indirectly, as in iron and fertilizer works and can factories of large size. The ironworks, while doing much work of other kinds, such as marine-engine and drydock work, have specialized in sugar-milling machinery to such an extent and with such proficiency that they receive orders from many countries and have established branch offices or works in several other countries. The principal can factory has a capacity of 100,000 cans an hour. There are many other kinds of manufacturing but on a small scale. Strikes have seldom occurred in Hawaii, but in 1909 and again in 1920 about 7,000 Japanese labourers struck, unsuccessfully, on the sugar plantations of the island of Oahu. Unionism has obtained little foothold. There is a growing tendency toward welfare legislation affecting labour. In 1913 a Compulsory Workmen's Compensation Act was passed and a public utilities commission was created. The railways were already under the Interstate Commerce Commission, and in 1920 by Act of Congress the telephone, telegraph and wireless utilities were brought under it.

*Communications.*—The rapid growth of commerce on the Pacific, due to general causes as well as to the opening of the Panama Canal, called for the formulation and execution of a comprehensive plan, involving an expenditure of many millions of dollars, for the development of shipping facilities at this commercial cross-roads. To this end much has been accomplished since 1905 by the Federal and territorial Governments and private enterprise. Among other things, the harbours at Hilo on the island of Hawaii and at Kahului on the island of Maui have been developed by the construction of breakwaters and wharves and by dredging, and similar work is in progress at Nawiliwili, on the island of Kaui. At Honolulu the harbour was deepened and widened, and in 1921 was being extended at one end, while near the other end a smaller harbour is being made for small vessels. At Honolulu there were in 1920 two floating drydocks, two automatic coal-handling plants and the oil-storage tanks of three companies, connected with the wharves by pipe lines and electrical freight-handling apparatus. Practically all the new wharves are of concrete. From 1910 to 1920 the arrivals and departures of deep-sea vessels, mainly steamships, but exclusive of numerous naval vessels, army transports and coal-bunker vessels, increased from 864 to 1,069, and their tonnage from 2,601,676 to 5,439,976. A fleet of 12 steamers is engaged exclusively in inter-island traffic. There are approximately 350 m. of steam railways on the four principal islands, besides about 625 m. of private railways on sugar plantations. Road construction has proceeded rapidly for some years. Much of it is of concrete. Hawaii was the first country to establish wireless communication for commercial purposes. Besides a cable there are four powerful wireless plants for trans-oceanic communication, and smaller stations for communication between the islands and with ships at sea. The five larger islands are well covered with efficient telephone systems.

*Administration.*—In 1913 the territorial Legislature provided for open direct primaries in territorial and county elections. In 1918 Congress authorized the territorial Legislature to provide for woman suffrage, but before the Legislature acted this was brought about in 1920 by the 19th Amendment to the Federal Constitution. At the ensuing election many women failed to register. The total registration was 26,366, of whom 17,084 were men and 9,282 women. By races the registered voters comprised 11,219 Hawaiians, 3,460 part-Hawaiians, 3,336 Americans, 3,091 Portuguese, 1,142 Chinese, 658 Japanese and 1,460 others, largely British. The first territorial Legislature was controlled by the Home Rule party, whose slogan was "Hawaii for the Hawaiians," but since then the voters have been divided mainly, and in late years entirely, between the Republican and Democratic parties, with the Republicans in the majority.

*Finance.*—The bonded debt of the territory was in 1920 $12,374,000, bearing rates of interest from 3½ to 4½%. Most of this has been incurred during 1910–20 for public improvements, chiefly wharves, roads, school-houses, and public buildings. Much current revenue also is expended on public improvements. The counties have no bonded debt except that the city and county of Honolulu issued small amounts of district improvement bonds payable in instalments by assessments on the property benefited, but $3,736,747.39 of the territorial bonded debt has been incurred for county improvements, for which the counties reimburse the territory in interest and sinking funds. The total revenue of the territory and counties for the year ended June 30 1920 was $9,902,092.25, of which $4,845,476.29 went to the territory and $5,056,618.96 to the counties, as compared with $2,621,758.01 and $1,394,693.29 respectively for 1910.

*Education.*—The recent changes include the introduction of kindergartens in the public-school system, the enlargement of the college of agriculture and mechanic arts into a university, to which has been transferred the aquarium and the marine biological laboratory connected therewith, the establishment of a trade school and schools for the physically defective and the feeble-minded, the multiplication of high schools and the extension of physical education, music, industrial training and home-making in the primary and secondary schools. Medical inspection of school children is regularly made, and a dental infirmary for them has been provided for by private gift. Between 1905 and 1920 many large concrete school buildings were erected. Public-school buildings furnish community centres, and they and their grounds are used in evenings by private organizations for educational moving-pictures, mass singing, short talks and other special features. Perhaps the most striking feature in Hawaiian education is the diversity of races and racial mixtures, sometimes 40 to 50 in a single school, and the absence of racial feeling. The number of pupils increased from 25,537 in 1910 to 45,701 in 1920, of whom 38,295 were in the public schools and 7,406 in private schools. Noteworthy, too, is the increase of Japanese pupils in the public schools from 6,393 in 1910 to 17,541 in 1920. For some years the Japanese have maintained through the territory so-called Japanese language schools, which their children attended before or after the public-school hours, and at which were taught not only the Japanese language but also Japanese history, institutions, ideals and loyalty in spite of the fact that most of these children were American citizens by birth. In 1920 the problem was settled by the passage of a law, acceptable to the Japanese, subjecting all such schools to the supervision of the department of public instruction, limiting them to one hour in the afternoon, six days a week, and requiring the teachers to pass satisfactory tests in the English language, American history and institutions and the ideals of democracy, and to use only such text-books and give only such courses as should be approved by the department. In 1912 a territorial library was opened in a handsome building in Honolulu's civic centre. It now has nearly 50,000 volumes, a trained corps of librarians, and 232 stations throughout the territory which it supplies through "travelling libraries."

*Charities.*—Of all the departments of the territorial Government, none, except that of education, is of wider scope or expends more out of current revenues than that of public health. An unusual feature is the employment or subsidizing of physicians, so that all, however indigent or remote from centres of population, may have proper medical attendance. The principal territorial institution under this department is the leper settlement on the island of Molokai, with its auxiliary the leper hospital in Honolulu. Formerly emphasis was laid on isolation, with the result that the inmates of these institutions were regarded as outcasts and, although at one time they numbered over 1,200, it was so difficult to enforce the law that many remained at large and little progress was made in the eradication of the disease. In 1909 the policy was changed so as to lay emphasis on treatment, with the result that the lepers freely surrendered themselves, and the number of inmates, which at first increased, was reduced to 663 by 1920, and there were comparatively few lepers at large.

*History.*—During 1910–20 Hawaii grew in importance as the commercial cross-roads of the Pacific, as the military and naval outpost of the Pacific coast of the United States, which has called for an expenditure of vast sums on the great naval station at Pearl Harbor and the numerous forts and military posts on Oahu I., and as the friendly meeting place of East and West. In 1917 there was incorporated in Hawaii as the Pan-Pacific Union what had for some years previously been known as the Hands-around-the-Pacific Club, the objects of which were not only to cultivate further the spirit of interracial brotherhood which had already become a notable feature in Hawaii, but also to foster a similar spirit among all the peoples of the Pacific and promote coöperation among them for their common welfare. In 1920 it inaugurated a series of Pan-Pacific conferences to be held at Honolulu, the first of which was a scientific conference held in Aug. 1920, and the second of which, an educational conference, was set for Aug. 1921. While Hawaii was called on heavily and responded beyond her quota for men and money for the World War, she continued to enjoy great prosperity owing to the demand for her products. In 1909 President Roosevelt, in order to prevent poaching by Japanese fertilizer capitalists, set aside as a bird reservation the chain of small islands extending for 1,200 m. to the N.W. of the larger islands, excepting Midway I., on which there is a cable station. This is the largest and most populous bird colony in the world.

In 1916 Congress reserved as a national park the active vol-

canoes, Kilauea and Mauna Loa, on the island of Hawaii, and the great extinct crater, Haleakala, on the island of Maui, with their surrounding regions. The healthy climate and beautiful scenery are attracting tourists in numbers beyond the capacity of steamships to bring them and are making the tourist business one of great importance. In 1920 the centenary of the arrival of the missionaries was celebrated on a grand scale, reviewing a century of what has been called a great history in miniature. The governors of Hawaii between 1907 and 1921 were:—W. F. Frear, 1907–13; L. E. Pinkham, 1913–8; and C. J. McCarthy, 1918.

*Authorities.*—Consult, in addition to the list in 13.93, *Preliminary Catalogue of Hawaiiana*, (the most complete bibliography, 1916); *The Centennial Book 1820–1920*, (by 16 authors, 1920); H. H. Gowen, *The Napoleon of the Pacific* (1919); O. H. and A. E. C. Gulick, *The Pilgrims of Hawaii* (1918); W. R. Castle, Jr., *Hawaii Past and Present* (1916); N. B. Emerson, *Unwritten Literature of Hawaii* (1909); C. W. Baldwin, *Geography of the Hawaiian Islands* (1908); W. A. Bryan, *Natural History of Hawaii* (with bibliography, 1915); W. T. Brigham, *The Volcanoes of Kilauea and Maunaloa* (1909); J. F. Rock, *The Indigenous Trees of the Hawaiian Islands* (1913); *The Ornamental Trees of Hawaii* (1917); D. S. Jordan and B. W. Evermann, *The Aquatic Resources of the Hawaiian Islands* (3 vols., 1905); *A Survey of Education in Hawaii*, made under the direction of the U.S. Commissioner of Education (1920); Reports of the U.S. Commissioner of Labor on Hawaii (1901–3–6–11–16); *Men of Hawaii*, compiled by *Honolulu Star-Bulletin*, Ltd. (1917, revised edition in prep. 1921); miscellaneous publications of Bernice Pauahi Bishop Museum of Polynesian Ethnology and Natural History. For current history and statistics, see particularly annual reports of the governor of Hawaii and Thrum's *Hawaiian Annual*. (W. F. F.)

**HAY, IAN,** pen name of JOHN HAY BEITH (1876– ), British novelist, was born at Rusholme, nr. Manchester, April 17 1876, and was educated at Fettes College, Edinburgh, and St. John's College, Cambridge. At the outbreak of the World War he joined the Argyll and Sutherland Highlanders, 10th Service Batt., was mentioned in despatches and decorated with the M.C. He published amongst other novels *Pip* (1907) and *A Man's Man* (1909); but he is best known as the author of *The First Hundred Thousand* (1915), a humorous sketch of military life in the early days of recruiting, and its sequel *The Last Million* (1918). In 1917 he published *Carrying On*, and in 1919 his novel *Happy Go Lucky* (1913) was dramatized as *Tilly of Bloomsbury* and produced by Arthur Bourchier at the Apollo theatre, London. *A Safety Match* (1911) was also dramatized and produced by Arthur Bourchier at the Strand theatre in Jan. 1921.

**HAYASHI, TADASU,** COUNT (1850–1913), Japanese statesman (*see* 13.109). In the second Saionji Cabinet (1911–2) he held office *ad interim* as Foreign Minister during the absence of Visct. Uchida in Washington, and also held the portfolio of the Ministry of Communications. Owing to having contracted diabetes, from Dec. 1912 he lived in strict retirement at his villa at Hayama. In the following June he fractured his thigh as the result of being thrown out of a 'rikisha, and amputation was found necessary. He failed to rally completely from the operation and died on July 10 1913. He was buried in the Foreign Office corner of the Aoyama cemetery. In his death Japan lost an eminent diplomat, a genuine scholar and a man of strong opinions.

**HAZLITT, WILLIAM CAREW** (1834–1913), British bibliographer (*see* 23.120), died at Richmond, Sur., Sept. 8 1913.

**HEALTH MINISTRY.**—The Ministry of Health in Great Britain was created by the Act of 1919. This had as its principal object the concentration of the main health services of the country in a single department under a Minister of Health responsible to Parliament. The Act in the form in which it received the royal assent established a Minister of Health for England and Wales with a parliamentary under-secretary. Wales was given a Board of Health separately constituted but responsible directly to the minister. A Scottish Act was subsequently passed, setting up a Scottish Board of Health; this is entirely a separate organization and its chairman and parliamentary head is the Secretary for Scotland, who has a Scottish Under-Secretary for Health. The main Act also designated the Chief Secretary for Ireland as Minister for Health in Ireland. He is assisted by an Irish Public Health Council but its functions are purely advisory and its members are (except all nominated directly by the Chief Secretary. It is important therefore to note that the health administrations of England and Wales, Scotland, and Ireland respectively, are quite independent, are under three distinct ministers, and that if any United Kingdom health legislation is desired it must be sanctioned by three distinct Government offices. Nurses' registration, indeed, was carried in 1920 in the passage of three identical Acts; and the Medical Research Committee (a United Kingdom body) had to be withdrawn completely from the sphere of the Health Ministries and placed under a committee of the Privy Council. In practice the Ministry of Health and the Scottish Board of Health perform almost identical functions and have proceeded on similar lines. Conditions in Ireland are so different that no comparison is possible.

The Ministry of Health came into being on July 1 1919 and assumed from that date the whole of the powers and duties of the Local Government Board and of the English and Welsh insurance commissioners, save for their powers over the Medical Research Committee. The powers of the Privy Council relating to midwives were immediately vested in the new ministry. On Oct. 1 it took over, as provided by the Act, the powers of the Board of Education with respect to the health of mothers and young children, and of the Home Office in relation to infant life protection under the Children Act. On Dec. 1 the ministry further assumed responsibility for the duties of the Board of Education regarding the medical inspection and treatment of children and young persons. Arrangements had however been made to enable certain of these latter duties to be carried out by the Board of Education on behalf of the Minister of Health.

In May 1920 the ministry took over from the Home Office the administration of the Anatomy Acts and of certain powers and duties in relation to lunacy and mental deficiency. The 1919 Act also prescribes that there shall be transferred to the Ministry of Health "all or any of the powers and duties of the Minister of Pensions with respect to the health of disabled officers and men after they have left the service," and the date was to be not later than three years after the termination of the World War (*see* PENSIONS MINISTRY). Many powers inherited from the Local Government Board, but inappropriate to the new body, have been transferred to other departments, ranging from the Board of Education to the Electricity Commissioners and the Ministry of Transport.

The activities of the new ministry fall into five main sub-divisions:—(1) public health, (2) local administration and taxation, (3) housing and town-planning, (4) administration of the Poor Law and the Old Age Pensions Acts, (5) national health insurance.

It will be seen that these arise naturally by inheritance from the parent bodies. Indeed, Dr. Addison, the then President of the Local Government Board and Minister Designate of Health, was careful to point out when introducing the bill that no new medical treatment was provided for any person by the bill, nor did it affect the functions of any local authority of any kind. There is, however, one interesting innovation in connexion with the actual machinery of the Act itself. Section iv. provides that consultative councils shall be established for the purpose of providing advice and assistance to the minister. They have the power of making recommendations to the minister on their own initiative and their reports are to be published if possible. Already several of these councils have been set up (*e.g.* medical and allied subjects, insurance, and Welsh affairs), and a report by the first-named, outlining extensive changes in health organization, was published in 1920.

The organization and administration of public health in England on systematic and vigorous principles dates from the Royal Sanitary Commission of 1869. As a result of the commission's report the Local Government Board was set up in 1871. In 1872 the great Public Health Act was passed which for the first time organized all England into sanitary districts, imposed on every sanitary authority the obligation of appointing both a medical officer of health and an inspector of nuisances, and established the principle of a grant-in-aid towards their salaries. Sanitary law was further amended and codified by the Act of 1875 whose 343 sections still determine in many fields the health administration of the country. This vigorous health policy produced almost unhoped for results. The group of typhus, typhoid, scarlet fever, smallpox, cholera, diphtheria, measles and whooping-cough—the "fevers"—caused in the decade 1861–70 713,000 deaths out of a population for England and Wales numbering roughly 22,000,000. In the years 1910–9 the population had risen to some 33,000,000, but the deaths from this group sank to 252,000, and of these measles and whooping-cough accounted for 169,000.

The position was reviewed by a Royal Commission from 1903–9

While Hawaii exports and imports more of what it produces and consumes than most other countries, there is nevertheless considerable farming for subsistence, and several industries, such as the live-stock and fishing industries, figure largely in local trade. Much has been done since 1895 to promote homesteading of public lands, but with small success. During 1910–20 2,650 homesteads were taken up, covering an area of about 55,000 ac., at prices aggregating about $1,500,000, which was probably about a third of the actual value. The most striking feature in Hawaii's industries as well as that which has contributed most to their success, is the extent to which science is applied, not only by the individual industrial concerns but also through such more general agencies as the sugar planters' association's experiment station, the university of Hawaii, the territorial bureau of agriculture and forestry and the U.S. experiment station.

Although Hawaii is essentially an agricultural country, the principal agricultural industries are such as require much manufacturing, not only directly, as in sugar, rice and coffee in mills and fruit and fish in canneries, but also indirectly, as in iron and fertilizer works and can factories of large size. The ironworks, while doing much work of other kinds, such as marine-engine and drydock work, have specialized in sugar-milling machinery to such an extent and with such proficiency that they receive orders from many countries and have established branch offices or works in several other countries. The principal can factory has a capacity of 100,000 cans an hour. There are many other kinds of manufacturing but on a small scale. Strikes have seldom occurred in Hawaii, but in 1909 and again in 1920 about 7,000 Japanese labourers struck, unsuccessfully, on the sugar plantations of the island of Oahu. Unionism has obtained little foothold. There is a growing tendency toward welfare legislation affecting labour. In 1913 a Compulsory Workmen's Compensation Act was passed and a public utilities commission was created. The railways were already under the Interstate Commerce Commission, and in 1920 by Act of Congress the telephone, telegraph and wireless utilities were brought under it.

*Communications.*—The rapid growth of commerce on the Pacific, due to general causes as well as to the opening of the Panama Canal, called for the formulation and execution of a comprehensive plan, involving an expenditure of many millions of dollars, for the development of shipping facilities at this commercial cross-roads. To this end much has been accomplished since 1905 by the Federal and territorial Governments and private enterprise. Among other things, the harbours at Hilo on the island of Hawaii and at Kahului on the island of Maui have been developed by the construction of breakwaters and wharves and by dredging, and similar work is in progress at Nawiliwili, on the island of Kaui. At Honolulu the harbour was deepened and widened, and in 1921 was being extended at one end, while near the other end a smaller harbour is being made for small vessels. At Honolulu there were in 1920 two floating drydocks, two automatic coal-handling plants and the oil-storage tanks of three companies, connected with the wharves by pipe lines and electrical freight-handling apparatus. Practically all the new wharves are of concrete. From 1910 to 1920 the arrivals and departures of deep-sea vessels, mainly steamships, but exclusive of numerous naval vessels, army transports and coal-bunker vessels, increased from 864 to 1,069, and their tonnage from 2,601,676 to 5,439,976. A fleet of 12 steamers is engaged exclusively in inter-island traffic. There are approximately 350 m. of steam railways on the four principal islands, besides about 625 m. of private railways on sugar plantations. Road construction has proceeded rapidly for some years. Much of it is of concrete. Hawaii was the first country to establish wireless communication for commercial purposes. Besides a cable there are four powerful wireless plants for trans-oceanic communication, and smaller stations for communication between the islands and with ships at sea. The five larger islands are well covered with efficient telephone systems.

*Administration.*—In 1913 the territorial Legislature provided for open direct primaries in territorial and county elections. In 1918 Congress authorized the territorial Legislature to provide for woman suffrage, but before the Legislature acted this was brought about in 1920 by the 19th Amendment to the Federal Constitution. At the ensuing election many women failed to register. The total registration was 26,366, of whom 17,084 were men and 9,282 women. By races the registered voters comprised 11,219 Hawaiians, 3,460 part-Hawaiians, 3,336 Americans, 3,091 Portuguese, 1,142 Chinese, 658 Japanese and 1,460 others, largely British. The first territorial Legislature was controlled by the Home Rule party, whose slogan was "Hawaii for the Hawaiians," but since then the voters have been divided mainly, and in late years entirely, between the Republican and Democratic parties, with the Republicans in the majority.

*Finance.*—The bonded debt of the territory was in 1920 $12,374,000, bearing rates of interest from 3½ to 4½%. Most of this has been incurred during 1910–20 for public improvements, chiefly wharves, roads, school-houses, and public buildings. Much current revenue also is expended on public improvements. The counties have no bonded debt except that the city and county of Honolulu issued small amounts of district improvement bonds payable in instalments by assessments on the property benefited, but $3,736,747.39 of the territorial bonded debt has been incurred for county improvements, for which the counties reimburse the territory in interest and sinking funds. The total revenue of the territory and counties for the year ended June 30 1920 was $9,902,092.25, of which $4,845,476.29 went to the territory and $5,056,618.96 to the counties, as compared with $2,621,758.01 and $1,394,693.29 respectively for 1910.

*Education.*—The recent changes include the introduction of kindergartens in the public-school system, the enlargement of the college of agriculture and mechanic arts into a university, to which has been transferred the aquarium and the marine biological laboratory connected therewith, the establishment of a trade school and schools for the physically defective and the feeble-minded, the multiplication of high schools and the extension of physical education, music, industrial training and home-making in the primary and secondary schools. Medical inspection of school children is regularly made, and a dental infirmary for them has been provided for by private gift. Between 1905 and 1920 many large concrete school buildings were erected. Public-school buildings furnish community centres, and they and their grounds are used in evenings by private organizations for educational moving-pictures, mass singing, short talks and other special features. Perhaps the most striking feature in Hawaiian education is the diversity of races and racial mixtures, sometimes 40 to 50 in a single school, and the absence of racial feeling. The number of pupils increased from 25,537 in 1910 to 45,701 in 1920, of whom 38,295 were in the public schools and 7,406 in private schools. Noteworthy, too, is the increase of Japanese pupils in the public schools from 6,393 in 1910 to 17,541 in 1920. For some years the Japanese have maintained through the territory so-called Japanese language schools, which their children attended before or after the public-school hours, and at which were taught not only the Japanese language but also Japanese history, institutions, ideals and loyalty in spite of the fact that most of these children were American citizens by birth. In 1920 the problem was settled by the passage of a law, acceptable to the Japanese, subjecting all such schools to the supervision of the department of public instruction, limiting them to one hour in the afternoon, six days a week, and requiring the teachers to pass satisfactory tests in the English language, American history and institutions and the ideals of democracy, and to use only such text-books and give only such courses as should be approved by the department. In 1912 a territorial library was opened in a handsome building in Honolulu's civic centre. It now has nearly 50,000 volumes, a trained corps of librarians, and 232 stations throughout the territory which it supplies through "travelling libraries."

*Charities.*—Of all the departments of the territorial Government, none, except that of education, is of wider scope or expends more out of current revenues than that of public health. An unusual feature is the employment or subsidizing of physicians, so that all, however indigent or remote from centres of population, may have proper medical attendance. The principal territorial institution under this department is the leper settlement on the island of Molokai, with its auxiliary the leper hospital in Honolulu. Formerly emphasis was laid on isolation, with the result that the inmates of these institutions were regarded as outcasts and, although at one time they numbered over 1,200, it was so difficult to enforce the law that many remained at large and little progress was made in the eradication of the disease. In 1909 the policy was changed so as to lay emphasis on treatment, with the result that the lepers freely surrendered themselves, and the number of inmates, which at first increased, was reduced to 663 by 1920, and there were comparatively few lepers at large.

*History.*—During 1910–20 Hawaii grew in importance as the commercial cross-roads of the Pacific, as the military and naval outpost of the Pacific coast of the United States, which has called for an expenditure of vast sums on the great naval station at Pearl Harbor and the numerous forts and military posts on Oahu I., and as the friendly meeting place of East and West. In 1917 there was incorporated in Hawaii as the Pan-Pacific Union what had for some years previously been known as the Hands-around-the-Pacific Club, the objects of which were not only to cultivate further the spirit of interracial brotherhood which had already become a notable feature in Hawaii, but also to foster a similar spirit among all the peoples of the Pacific and promote coöperation among them for their common welfare. In 1920 it inaugurated a series of Pan-Pacific conferences to be held at Honolulu, the first of which was a scientific conference held in Aug. 1920, and the second of which, an educational conference, was set for Aug. 1921. While Hawaii was called on heavily and responded beyond her quota for men and money for the World War, she continued to enjoy great prosperity owing to the demand for her products. In 1909 President Roosevelt, in order to prevent poaching by Japanese fertilizer capitalists, set aside as a bird reservation the chain of small islands extending for 1,200 m. to the N.W. of the larger islands, excepting Midway I., on which there is a cable station. This is the largest and most populous bird colony in the world.

In 1916 Congress reserved as a national park the active vol-

support as presidential candidate at the National Democratic Convention. In 1905 he was Democratic candidate for mayor of New York on the Municipal Ownership ticket, and four years later on the Independence League ticket; in 1906 he was candidate for governor of New York on the Democratic and Independence League tickets, in every instance being defeated. He strongly opposed the League of Nations.

**HEART AND LUNG SURGERY.**—In recent years notable advances have been made in the surgery of the heart and lung.

1. HEART.—It has been proved experimentally and verified by actual experience of operations in man that the heart may be safely handled, incised, and sutured; and cardiac surgery, thought to be impossible 30 years ago, had by 1921 achieved many striking successes. Operation on the pericardium and heart is undertaken (1) for the relief of pericardial effusion, serous, purulent or haemorrhagic; (2) for releasing pericardial adhesions; (3) for injuries and the removal of foreign bodies; (4) for the reanimation of a heart which has ceased to beat. (5) It has been proposed and attempted for the relief of certain valvular lesions, and for (6) tumours of the heart.

*Pericardial effusion.*—When it is decided to evacuate the contents of the pericardium it should be exposed and a sufficient incision made in it; paracentesis of the pericardium is uncertain and dangerous; as an operation it should be abandoned, though the cautious use of an exploring needle for diagnostic purposes may occasionally be desirable. Especially when the effusion is purulent every endeavour should be made to avoid opening a healthy pleura. The extent to which the pericardium is overlapped by the pleura varies considerably, but, according to Voinitch, there is invariably a triangular area of safety at the inner end of the 6th and 7th left costal cartilages. Pericardial effusion by no means always displaces the reflection of the pleura, but the surgeon can generally recognize the pleura and push it aside.

The lower the opening in the pericardium the better the drainage. Mintz (*Zentralblatt für Chir.*, 1904, p. 59) opened the pericardium in a case of suppurative pericarditis after resecting the 5th costal cartilage, and at once decided to drain it from below. He made an incision along the lower border of the 7th cartilage, separated the attachments of the abdominal muscles and of the diaphragm and continued blunt dissection until he reached the pericardium, which he then incised on a probe introduced through the upper wound. In the operation he subsequently advised the patient is placed with the chest somewhat raised; the surgeon, standing on the right, makes an incision along the lower border of the left 7th costal cartilage extending 7 or 8 cm. outwards from the costo-ziphoid angle. The abdominal muscles are disinserted and the cartilage divided at each end of the wound, the diaphragm is next disinserted and the cartilage and skin retracted upwards. The prolongation of the internal mammary artery is seen and tied or displaced. The anterior inferior angle of the pleura is identified and avoided, and, nearer the median line, the pericardium is defined and incised.

In the operation recommended by Voinitch the left 6th and 7th cartilages and the adjoining edge of the sternum are resected.

Delorme and Mignon (*Rev. de Chi.*, 1895) give the following directions for opening the pericardium:—(1) Make a vertical incision 1 cm. external to the left border of the sternum from the lower border of the 7th to the upper border of the 4th costal cartilage. (2) Dissect off soft parts from ribs and cartilages for 1 cm. towards middle line and for two fingers breadth outwards. (3) Disarticulate and resect a piece of 5th and of 6th cartilage. (4) Carry the incision through intercostal muscles and perichondrium down to triangularis sterni. (5) With a director worked parallel to posterior surface of sternum detach insertions of triangularis sterni, introduce finger and completely detach soft parts from posterior surface of sternum, seek the pericardium just above the insertion of the cartilages into the sternum and separate it with the finger from the cellular tissue which covers it, then, when its opaque surface is clearly exposed and its transverse fibres recognised, continue the separation through the whole extent of the wound. Thus the pleura and the internal mammary artery are displaced outwards and are not seen. (6) Pick up the pericardium with forceps and incise it. These methods or some modification of them are those recommended for the surgical treatment of pericardial effusion, but they are not suitable as the first stage of operation on the heart itself.

*Cardiolysis.*—Intra-pericardial separation of adhesions (endopericardial cardiolysis) has been suggested, but its possible utility is not apparent. Extra-pericardial cardiolysis in which adhesions between the pericardium and the mediastinal tissues are separated is more likely to be useful. It has been proposed to introduce a graft of fat or of fascia lata to prevent fresh adhesions.

Pericardial thoracolysis, in which adhesions between the pericardium and the chest wall are separated and portions of ribs or costal cartilages excised, is an operation designed to free the heart from the rigid chest wall in front and to relieve an enlarging heart from compression in a too confined space. Good results have been obtained. The first operations of this kind were done in 1902 by Peterson and Simon at the suggestion of Brauer. Thorburn of Manchester (*Brit. Med. Journ.*, 1910, vol. i., p. 10) discusses the question and gives a table of 15 cases collected from literature. He relates one case done by himself and refers to two other operations by Stabb at the suggestion of Alexr. Morrison.

*Heart Wounds.*—The course and symptoms of heart wounds vary considerably. Instantaneous death may result from a quite small wound, and extensive injuries may be brought for treatment. Under war conditions most cases die on the field of battle with the symptoms so long ago described by Celsus (V. 26, 8.): "When the heart is wounded much blood is poured out, the pulse fails, pallor becomes extreme, the body is bedewed with cold and ill-smelling sweat, the extremities become chilled and speedy death ensues."

When seen the diagnosis may be obvious, or difficult and uncertain. The symptoms may be severe and the injury to the heart *nil;* thus Tuffier remarks, "the case in which the diagnosis of wound of the heart seemed to us the most obvious and the most clearly demonstrated by the situation of the wound and the grave condition of the patient was that of a woman in whom the revolver bullet had not even penetrated the thorax." This was probably an instance of contusion of the heart and analogous to the phenomenon of arterial paralysis. When the initial symptoms have subsided and the external haemorrhage has ceased the diagnosis is based upon the history of the case, the situation of the external wound and the signs of haemo-pericardium or haemothorax, or of a foreign body.

The classical signs of pericardial effusion are: the cardiac impulse and sounds are feeble or imperceptible and the area of cardiac dullness is enlarged; sometimes abnormal (pericardial) sounds can be heard, of these that known as the mill-wheel sound (*bruit de moulin*) has been much discussed; it is chiefly associated with air and fluid in the pericardium and was for a time thought to be pathognomic. It is thus described in a work by Stokes published in 1854: "They were not the rasping sounds of indurated lymph, or the leather creak of Collin, nor those proceeding from pericarditis with valvular murmur, but a mixture of the various attrition murmurs with a large crepitating and gurgling sound, while to all these phenomena was added a distinct metallic character."

Sudden distension of the pericardium with blood is a great surgical emergency. The auricles are compressed and signs of venous obstruction appear; there is great dyspnoea with cyanosis. The respiration is laboured and shallow and the pulse small, rapid and of low tension. It is urgent freely to open the pericardium and to decompress the heart.

In purulent pericarditis the upper segments of both recti may be rigid, and there may be a narrow band of oedema round the front and left side of the trunk about the level of the 5th interspace. The present writer has seen this band of oedema and has known suppurative pericarditis to be mistaken for inflammation below the diaphragm. Absence of diaphragmatic movement suggests pus in contact with the diaphragm. In pericarditis with effusion the right lobe of the liver is low; in dilatation of the heart the right lobe of the liver is not depressed. Many observers have found a small area of dullness in the left back just internal to the angle of the scapula, a purulent pericardial effusion has been tapped from the back in mistake for an empyema. The early diagnosis of purulent pericarditis is greatly assisted by X-ray examination and by the blood-count. These should never be omitted.

Bullets and other foreign bodies may lodge in the pericardium or in the heart muscle or in one of the cavities, in which it may become fixed or remain freely movable. Sometimes few or no symptoms are observed, and their presence is only demonstrated by radiography; sometimes they cause more or less frequent and severe attacks of pain and syncope, and give rise to abnormal sounds. Only by radiography can an accurate diagnosis be made.

The story of the wanderings of bullets and other foreign bodies in the vascular system of man is very remarkable. A bullet may perforate the heart or aorta without causing fatal haemorrhage.

A bullet may enter the hepatic vein or vena cava and pass on into the right ventricle, or enter a pulmonary vein and lodge in the left ventricle. Or it may enter the inferior vena cava and be carried by gravity against the blood current and be arrested in an iliac vein, or again a bullet may be expelled from the left ventricle into the aorta and travel with the blood current and be arrested in an artery, or from the right ventricle may be ejected into the pulmonary artery. In several cases during the World War the course of the projectile has been followed by radiography, and removed by operation from the vessel in which it became arrested.

*Operations for injury and the removal of foreign bodies.*—The operation must be so planned that free access to the heart is obtained and that any required operation on it can be carried out. We have to consider (*a*) the exposure of the heart; (*b*) the surgical manipulation of the heart; (*c*) the control of haemorrhage; (*d*) drainage of the pericardium.

The chief methods of opening the chest for exposure of the heart which have been successfully utilized are as follows:—

1. The various forms of flap operation of which the Delorme-Mignon-Kocher operation may be taken as a type: a vertical incision is made down the middle of the sternum from the level of the

3rd to that of the 5th cartilage; the upper end of the incision is then continued towards the left along the line of the 3rd cartilage and the lower end of the vertical incision is carried downwards and towards the left along the line of the 6th cartilage. The musculo-cutaneous flap is raised and turned outwards, the 4th, 5th, and 6th cartilages are removed, the internal mammary vessels are tied and divided (which is best done after removal of the 6th cartilage), triangularis sterni is cut through and displaced, the pleural edge being carefully avoided, and the pleura displaced by gauze pressure.

2. The Duval-Berasty operation. This operation opens both thorax and abdomen but does not divide ribs; it gives free exposure of the heart without opening the pleura but demands good vitality in the patient and seems unsuitable for possibly septic cases. It was used in several successful cases by French surgeons in the World War. It is thus carried out:—(1) Make a median incision from the level of the 3rd cartilage to the mid-point between xiphoid and umbilicus. (2) Separate the attachments of the muscles to the xiphoid and insinuate two fingers of the left hand behind the sternum, so as to protect the pericardium and the anterior margins of the pleura. (3) Divide the sternum transversely opposite the 3rd cartilage, and below the section split the gladiolus and xiphoid longitudinally. (4) Open the peritoneum along the line of the median incision in the upper abdomen. Open the pericardium in the middle line then divide the diaphragm between the two halves of the xiphoid cartilage, one blade of the scissors being within the pericardium and one in the abdominal cavity. While this cut is being made the heart must be gently lifted out of the way. The diaphragm is divided as far back as the coronary ligament. (5) The halves of the sternum can now be widely separated and "the whole contents of the pericardium are an open book to the surgeon. We have by this operation removed a bullet from the intra-pericardial portion of the vena cava inferior." (*Bull. et Mém. de la Soc. de Chi.*, Paris, June 1918.) (6) At the close of the operation the reconstitution of the divided structures is perfect. The incisions in the diaphragm and pericardium are sutured. The sections of the sternum fall together and do not require suture.

3. The Spangaro operation. Spangaro makes a long incision in an intercostal space, generally the 4th, and then divides or disarticulates the 4th and 5th costal cartilages at their union with the sternum, and in some cases the 3rd and 6th cartilages may also be divided. The 4th and 5th ribs are then forcibly drawn apart by a rib-spreader and a fine view is obtained.

4. The method of Duval as modified by Moynihan. "An incision is made exactly in the line of a rib following its curve from the edge of the sternum for about five inches outwards, down to the pectoralis major muscle a pair of forceps is pushed through the muscle until it touches the rib, the blades are opened and the muscle is split, and the separation carried from end to end of the incision. All bleeding vessels are ligated. The rib and costal cartilage are cleared. Two incisions are made through the periosteum close to the upper and lower edges of the rib, and from them the periosteum is stripped upwards and downwards and from the posterior surface. The periosteum which lies between the two incisions is left attached to the rib throughout the operation. As soon as the periosteum is freed from the posterior surface for half an inch the periosteal elevator of Doyen is slipped round the rib and pushed backwards towards the axilla and forwards to and along the costal cartilage until a length of about 5 in. is cleared. Here and there a little help may be needed with the knife or scissors to make the way easy for the instrument. The costal cartilage is now divided by two incisions meeting at a point, this allows the divided ends to dovetail together when the operation is nearing completion. When the cartilage is divided a gauze strip is passed underneath the rib, which is lifted gently upwards and outwards. In young patients the elasticity and suppleness of the rib are remarkable. It is quite easy to raise the bone out of the way throughout the operation and then to replace it.

"When the rib is elevated the periosteum is seen as a thickening of the pleura exposed in the wound. Through periosteum and pleura a small incision is made with the result that in the absence of adhesions air slowly enters the pleural cavity and the lung begins to collapse. The incision in the pleura is then lengthened always along the line of the periosteum, until there is room for the hand to pass through it. The rib-spreader is then introduced" (Sir B. Moynihan, *Brit. Journ. of Surgery*, vol. vii., 457). At the conclusion of the operation the rib is replaced and fixed by a suture.

5. Tuffier's method. Transverse sterno-thoracotomy. Transverse incision in the 4th intercostal space, prolonged over the sternum to the right side, opening the intercostal space, division of the sternum by Lister's forceps, retraction of the divided sternum to the maximum.

In many cases of injury to the heart the pleura has also been wounded, and in these the Spangaro or Duval operation has the advantage that the pleura and lung can also be examined. The dangers of pneumo-thorax on one side seem to have been exaggerated, and experience has shown that a differential pressure apparatus formerly considered essential is not necessary.

The danger of opening the pleura is not respiratory difficulty but infection. Moynihan lays stress on the patient being deeply anæsthetized before the pleura is opened, and on the opening in the pleura being made small at first so that the lung may slowly collapse.

6. The method of Petit de la Villéon. This operation is carried out under the guidance of the X rays; a small incision is made in an intercostal space and a special forceps thrust through it and pushed on closed until its shadow on the screen touches that of the foreign body; the forceps are then opened, the foreign body grasped, mobilized and pulled out. The method was elaborated by its author for removing foreign bodies from the lung, and has been applied by him to 15 cases of foreign body in the wall of the heart.

*Manipulation of the heart.*—The pericardium having been widely opened the heart may be safely palpated and grasped in the gloved hand; it feels like a live fish, and it may be steadied and drawn forwards and upwards by a fixation suture passed through the apex.

The specially dangerous regions of the heart are:—

(1) The coronary arteries between their origin from the aorta and their bifurcation. A wound or ligature in this situation is fatal: the heart becomes arrested in diastole from the failure of its own nutrition. Domenici, from experiments on dogs, concluded that the prognosis is more favourable when both artery and vein are ligatured than when the artery alone is tied (*Policlinico Romana*, 1916, p. 158). Sir G. H. Makins made the same observation respecting the femoral artery and vein. A branch of the coronary artery may be tied without ill effects.

(2) The inter-auricular septum and the cardiac ganglia and nerve plexuses which are found chiefly at the base of the right auricle and along the auriculo-ventricular groove. Krönecker and Schurey (quoted from Tuffier) have described a ganglion centre at the level of the auriculo-ventricular septum near the left border of the heart, a wound of which causes immediate arrest of the heart.

(3) The bundle of His. Carrel and Tuffier say "the starting point of the cardiac contractions is at the opening of the vena cava at the base of the right auricle, the fibres of the auriculo-ventricular bundle of His, which transmit the auricular excitation to the ventricles, traverse the inter-auricular septum, then the inter-ventricular septum and bifurcate and anastomose with the ventricular fibres." A sudden lesion of the bundle of His produces irregularity of contraction and dissociation of function of the two sides of the heart. A case published by Keith and Miller (*Lancet* 1906. II. 1429), in which the commencement and upper half of the main auriculo-ventricular bundle was destroyed by a gumma and the coronary arteries were partially obliterated, shows that the normal mechanism of the heart may be profoundly changed without a great disturbance of function, provided that these changes are not brought about too suddenly. The bundle of His is fully described by Keith and Flack (*Lancet* 1906. II. 359).

*The control of haemorrhage.*—Free haemorrhage from a wound in the heart is a great and imposing emergency: the heart, relieved from compression by the incision in the pericardium, contracts tumultuously, the field is obscured by the escaping blood, the blood-pressure is rapidly falling and death is imminent. Rapid, precise, and correct action can alone save life. The surgeon, just as in a case of ruptured spleen or of ruptured tubal gestation he plunges his hand into the abdomen through a mass of blood and seizes the bleeding vessel, so he must now plunge his hand into the pericardium, grasp the heart and by digital compression control the bleeding, and proceed to suture the wound. Suture is the method by which haemorrhage from the heart is permanently controlled, though ligature has been used in a wound of an auricular appendage. The vena cava may be compressed digitally or with suitable forceps as an aid in the arrest of haemorrhage.

When an incision is to be made into an unwounded heart, the sutures should be placed, and the loops drawn out of the way before the incision is made; tightening the sutures arrests the bleeding.

In experimental work on the heart the effect of compression of the great vessels has been tried. Carrel and Tuffier found that the entire vascular pedicle could be compressed for 45 seconds, the pulmonary artery for 10 minutes, the aorta for 6 minutes, the two venæ cavæ for 3½ minutes, which could be prolonged to 10 minutes if an oxygenated solution were injected into the carotids; compression of the four pulmonary veins was rapidly fatal, but isolated compression of one pulmonary vein was of no gravity. The times would probably not apply to the human heart; Trendelenburg found that the aorta and pulmonary artery must not be obstructed for more than a minute and a half.

*Drainage of the pericardium.*—In clean wounds this is unnecessary and even harmful; in infective pericarditis efficient drainage is a necessity, but is by no means easy to carry out. As fluid collects in the pericardium it accumulates mainly in the two postero-lateral pouches of the pericardium on each side of the partition formed by the projection of the two venæ cavæ and the right auricle, and in the dome-shaped space above, the heart is pushed forwards, approaching the chest wall more closely as the tension of the fluid increases, and the pouches formed by the reflexions of the pericardium on to the great vessels become distended. The effect of these changes is that described by French anatomists as the cul-de-sac of Tuffier, in English works as the oblique sinus, and by Reid, Keith as the bases of the left auricle. It is situated behind the left auricle and extends upwards between the right and left pulmonary veins and extends to the upper border of the left auricle and upwards the right as far as the innominate vein. It is 4 to 5 cm. in depth and is bounded by the œsophagus. The lower end is widely open below at the level

of the groove on the posterior surface of the heart between the left auricle and ventricle. The right border of the opening is on a lower level than the left and reaches as far downwards as the inferior vena cava. The opening faces downwards, forwards, and to the left.

In a distended pericardium the apex of the heart is carried forwards and the contents of the oblique sinus can escape, but with the emptying of the pericardium the ventricles and apex drop backwards and downwards and shut off the oblique sinus from the rest of the pericardial cavity so that it cannot drain through an anterior incision in the pericardium.

Failure to drain this recess properly was, in the writer's opinion, a cardinal factor in the fatal termination of a case of his own.

A left postero-lateral incision would drain this space, and can be made when the trans-pleural route is adopted. Rubber tissue is the best drainage material. The pericardium differs from the pleura and peritoneum in that it cannot be completely inspected and cleansed even if the apex and ventricles are pulled forward so as to expose the mouth of the oblique sinus; this is a cause of difficulty in deciding for or against drainage.

*Reanimation of an arrested heart.*—An epigastric incision is the quickest route though the trans-costal route has been used.

The heart is reached through an incision in the diaphragm, grasped directly near the apex by the thumb and forefinger and the ventricles compressed rhythmically 30–40 times a minute. Some surgeons have massaged the heart from the abdomen without incising the diaphragm.

Speed is an essential factor; massage must be commenced without any delay. The circulation has, indeed, been restored after a considerable interval, but recovery is not possible unless the organs are in a condition to benefit from the influx of blood; the nervous system suffers irreparable damage from cessation of circulation in about 15 minutes. The heart muscle retains its power of contraction a long time; according to Kuliabko (quoted from L. Wrede *Arch. f. kl. Chi.* Bd. 101 (1913) S. 835) contraction can be induced in the isolated human heart by passing through it a stream of warm oxygenated fluid even 24 hours after death.

Intra-cardiac injection of excitant substances such as strophanthin, adrenalin, and caffeine has been used either alone or in conjunction with massage, as also injection of saline solution or defibrinated blood, either intravenously or into the heart; with a view to rapid restoration of circulation through the coronary arteries injection through the carotid towards the heart has been suggested. Pieri reported 76 cases of heart massage. In 19 success was complete and permanent, in 16 partial and temporary, and in 41 failure was complete. In the successful cases the interval between cessation of the heart's action and the start of massage was from 2 to 15 minutes (*Revista Ospedalera*, April 15 1913, vol. iii., No. 7).

Wrede, in order to decide whether massage of the heart effected an artificial circulation of the blood and not a mere to and fro movement in which the pressure in veins and arteries was equal, injected colouring matter into the external jugular vein after death and then massaged the heart. He found the colouring matter had penetrated into the vessels of the portal circulation, and this he considered proved that capillary resistance had been overcome, but that it was conceivable that it was in the reverse direction.

*Proposed operations for certain valvular lesions.*—Sir Lauder Brunton (*Lancet*, 1902), witnessing the autopsy on a young girl who had died from uncomplicated mitral obstruction was led to reflect on the possibility of surgical relief in similar cases, and made experiments bearing on the subject. Carrel and Tuffier pursued the enquiry further (*Presse Médicale* mars 1914) and concluded that pure mitral stenosis, certain forms of stenosis of the aortic orifice and of the pulmonary artery, might derive benefit from surgical intervention. Schepelman (*Arch. f. kl. chi.*, 1912, vol. 97) suggested that congenital tricuspid stenosis might be amenable to operation.

The following operations were experimentally performed by Carrel and Tuffier:—Internal valvulotomy, external valvulotomy, auriculo-ventricular anastomosis, arterio-ventricular anastomosis, section of the mitral valve indirectly through the carotid artery after the manner of an internal urethrotomy, resection of valves. They effected derivation of the blood current by means of a piece of vein with the formation of an artificial valve. An ingenious method which they term "patching" was tried: a square piece of vein is sutured along three sides of its sides over the site of the arterial opening it is desired to enlarge, a small knife is insinuated beneath the patch at the unsewn edge, the vessel beneath incised, and the suture of the patch completed.

The only reference to operations for valvular disease in man which the writer has seen is by Tuffier, who mentions two cases. (*Fifth Congress of Int. Soc. of Surgery*, Brussels, July 1920):—"I observed, in a young man, a grave and rapidly progressive aortic stenosis. On the repeated request of his physician I decided to explore it. The vibration was intense: I reached the stenosis and very easily carried out a gradual dilatation by slowly introducing the little finger into the structured ring, the vibrations under the finger being intense; I abstained from trying to divide the stricture as I did not consider experimental enquiry sufficiently advanced. I did not expect to attain any result. The patient was well in a few days; he improved [illegible] and is still alive. I saw him three months ago."

In Dijon I attempted cardiotomy on a patient believed to be suffering from mitral stenosis; at the operation an inter-ventricular communication was found and the patient died in a few minutes.

*Tumours of the heart and paracardiac tumours.*—A primary tumour of the heart has not yet been diagnosed during life, and the symptoms to which they give rise having been referred to valvular lesions or to angina pectoris, but some forms of benign tumour are anatomically operable. Certain paracardiac tumours, mediastinal dermoids among others, adhere intimately to the pericardium and cause cardiac embarrassment.

Tuffier has successfully operated on one such case. Removal of the 2nd and 3rd costal cartilages disclosed a dermoid cyst as large as two fists filled with sebaceous matter, it was totally adherent and within it the aorta, the auricle and ventricle could be seen beating, and formed part of the wall without the interposition of the pericardium, part of the wall was calcareous and constricted the left half of the vascular pedicle. The cyst was drained, and six months later the calcified portion of its wall was broken up piecemeal. The patient recovered. Clerc and Duval (*Bull. et Mém. de la Soc. de Chi.* vol. xlvii., 1921, p. 200) published a successful case in which a dermoid cyst was completely removed from the mediastinum; the pleura was closed without drainage. On the second day after operation 500 c.c. of sterile fluid were removed by aspiration, after which there was no further complication.

*Literature and statistics.*—The paper by Fisher in *Langenbecks Archiv.*, vol. ix., (1868) and the article by Matas in Keen's *Surgery* (1909) give a full account of the subject and its literature as known at the respective dates; by contrasting them the great advance of knowledge will be evident. In Sir Charles Ballance's Bradshaw Lecture, 1919, a table is given of 152 cases of operation on the heart and pericardium subsequent to 1912 (with references) collected from literature; of these 104 recovered and 48 died, showing a mortality of 31·57 %. In 1920 Tuffier, in a paper at the Fifth Int. Cong. of Surgery at Brussels, referred to 305 cases with a mortality of 49·6 %. Statistics give some idea of the amount of work that has been done, but so many different conditions are present and the probability that many unsuccessful cases are not recorded is so great, that they are not reliable in estimating the risks of operation. In the *Lancet* of May 7 1921 a case is quoted from the *Journal of the American Med. Assn.* of Feb. 19 1921 in which E. M. Freeze successfully sutured a wound of both ventricles.

II. Lungs and Pleurae.—It was until recently believed that opening the pleural cavity without the aid of differential pressure might be fatal, and that incision or even handling of the lung would cause severe haemorrhage; these fears long retarded the progress of intra-thoracic surgery. Experience has shown that an open pneumothorax on one side is without grave danger, that the once-dreaded pulmonary collapse is an assistance rather than otherwise to the surgeon, and that bleeding from the lung is readily arrested by suture. The scope of intra-pleural surgery has been considerably extended, not so much by any new discovery as by the application of the general principles of surgery.

Operations on the lung and pleura are now undertaken (*a*) for injuries, (*b*) for certain diseases. The pleural cavity is opened and the lung exposed by resection of a rib or ribs or by rib-spreading with, or sometimes without, division of one or more ribs or cartilages. Osteo-plastic flaps are mostly abandoned.

*Injuries.*—The experience of the World War has shown that the ideal treatment of a wound (gunshot or other) is mechanical cleansing, removal of all foreign bodies and devitalized tissue, and repair by suture. This should be the aim of the surgeon in dealing with wounds of the lung, and the complete operation for this condition would be excision of the parietal wound, removal of all blood and clots from the pleura, exposure of the lung, removal of any foreign body, cleansing and repair of the pulmonary wound and closure of the thorax.

Operation for retained projectiles in the lung is fully described and discussed in a paper by Sir B. Moynihan in the *Brit. Journ. of Surgery*, April 1920. He recommends the open method of Duval and the separation of all adhesions, however dense, as the first step of the intra-pleural operation. Duval's lung forceps are used for fixing the lung and bringing the area of incision to the surface. The specially dangerous region is the root of the lung "the number of vessels is great and their size formidable. A wound of the root of the lung should be inflicted with extreme caution, for if a vessel is wounded it is exceedingly difficult to arrest the haemorrhage. It is almost impossible to secure the vessel and to ligate it in the ordinary manner. If a suture is passed round the vessel it is likely that other vessels will be wounded by it. For this reason many of the French surgeons advise plugging the wound with gauze, which is left in position for two or three days. The root of the lung is almost immobile. The operator must go down to it; he cannot bring the parts near to him. All the steps of the operation can, and should, be visible to the surgeon—nothing need be done in the dark; but the sometimes and

the immobility render all manipulations much more difficult than they are elsewhere. All technical procedures at the root of the lung are made easier if the parts near the hilum are fixed by the special light forceps of Duval. They not only withdrew the lung from the path of the surgeon, but give a stable field in which to work." Another point emphasized by Moynihan is the "mimicry of a projectile by the hard rounded but irregular condition of a bronchus." Most foreign bodies which have entered a bronchus by the mouth can now be removed with the aid of the bronchoscope, the recently perfected instrument for viewing the bronchus, and unless they have caused abscess would rarely call for the trans-pleural operation.

*Disease.*—Operations on the lung and pleura for disease have for their object:—(1) The removal of morbid products from the lung by incision and drainage or by excision of portions of lung. (2) The induction of collapse of the lung for the arrest of haemoptysis or to give it rest and assist in recovery from tuberculous disease or to allow a cavity to close. (3) The removal of morbid products from the pleura and the separation of adhesions.

1. Incision of lung and drainage have been carried out (*a*) for hydatid cyst of lung; the cyst is incised, its contents evacuated, and the adventitious cyst wall left in place, either marsupialised and drained or sutured; (*b*) for gangrene and abscess of lung; (*c*) for tuberculous cavities.

Excision of portions of lung for tuberculosis has been done in one case with survival for seven years. But Tuffier and Martin wrote in 1910:—"Pneumotomy for tuberculous cavities has now fallen into disfavour, as likewise pneumectomy for early tuberculosis."

2. Collapse of lung is induced either by opening the pleura and admitting air, by injecting nitrogen, or by incising the chest wall down to the pleura, with or without resection of rib, detaching the parietal pleura and plugging the resulting cavity with gauze so as to bring about an extra-pleural pneumo-thorax.

3. Fluid is removed from the pleura by aspiration or by incision. Aspiration is employed for serous effusions and for haemothorax. Incision with excision of a portion of one or more ribs is current for acute empyema; some cases have been cured by aspiration only.

Recent experience seems to show that a wider opening into the pleural cavity than that usually made is desirable in empyema, so that the cavity can be inspected, the hand introduced, and all adhesions separated and false membranes and lymph removed. This is the only sure way to detect an inter-lobar abscess, and to secure expansion of the lung.

Immediate suture, after complete evacuation of the pus, has been carried out, but unless done very early does not seem likely to succeed. It has been suggested the pus should be removed as completely as possible by aspiration, and then 20–60 c.c. of a 2% solution of formalin in glycerine injected into the pleura. Chronic empyema in which the lung fails to expand and a persistent sinus has resulted has until recently been dealt with by extensive thoracotomy such as Estlander's operation with the object of making the chest contract down to the level of the contracted lung; the more recent operation has for its object the expansion of the lung. A free opening is made in the chest by the method of Duval or some analagous method, and the false membranes, often of considerable density, which bind down the lung are stripped off, and the pleural cavity closed.

Of the various intra-thoracic operations that have been suggested and tried, some will doubtless be abandoned while others will be developed and pass into current surgical practice. The war demanded new methods of diagnosis and treatment, and these were evolved and perfected amid stress and strain.

It was found that the chest cavity hitherto treated with undue deference could be opened and its contents inspected, palpated and dealt with as readily and as safely as the contents of the abdomen. This knowledge, won at the cost of so much suffering, has now to be applied to civil surgery, and when this is done even more successful results may be expected. Mr. G. E. Gask, in his Lettsomian lectures for 1921 gave an able exposition of the surgery of the lung and pleura as influenced by the experience of the World War; these lectures have been published in the *Transactions of the Medical Society of London*. (C. A. B.)

**HEART DISEASES** (*see* 13,132).—The study of disease of the heart entered on a new phase in the second decade of the 20th century, as a result of the researches of the Scottish physician, Sir James Mackenzie (b. 1853). His work, which first made a public appearance in 1902 with his *Study of the Pulse*, and later was embodied in *Diseases of the Heart* (1908) and *Principles of Diagnosis in Heart Affections* (1916), followed three lines. In the first place there were new observations on the rhythm of the heart itself; secondly there were observations and conclusions regarding the meaning of heart failure and its recognition; finally the importance of the early signs of disease as opposed to its later manifestations was emphasized.

Mackenzie showed that by making tracings from the neck as well as from the wrist it was possible to obtain information regarding the activity of all the chambers of the heart. The neck tracings gave a wave when the auricles contracted. This was caused by a return of blood up the jugular veins, following this came the ordinary pulse beat in the carotid artery, which lies close to the jugular vein and so can be recorded by the same tambour. Thereafter a third wave in the vein indicated the muscular tightening-up of the organ at full systole.

The three waves were named respectively *a* (auricular), (carotid) and *v* (ventricular). Normally the *a* wave occurs $\frac{1}{5}$ sec. before the *c* wave. The tracing which shows these waves is a continuous line and thus it is difficult to determine in the first instance which wave is which. This difficulty can be overcome by putting an ordinary pulse tracing on the same piece of paper. The carotid pulse occurs $\frac{1}{10}$ sec. before the radial pulse. Thus the wave occurring in the composite tracing $\frac{1}{10}$ sec. before any beat in the wrist pulse tracing is the *c* wave. It is then easy to determine the other waves.

This work led to the differentiation of cardiac irregularities—a subject which had been shrouded in mystery. It was much facilitated by the discovery of the string galvanometer or "electrocardiograph." This instrument depends for its working on the oscillations of a special string between the poles of a magnet. Currents are set up when the heart beats, separate currents for auricles and ventricles, and these cause the string to move. Its movements are photographed onto a moving plate in such a way that a line tracing is produced. The nomenclature of electrocardiograms differs from that of pulse tracings in that the *a* wave is called the *p* wave, the *c* wave the *r* and the *v* wave the *t* wave. (It must be noted, however, that the tracings are produced in entirely different ways and therefore there is no real comparison between these waves.) There are several "leads" to the electrocardiograph—*i.e.* the patient may have a hand and a foot in the salt pails which constitute its terminals or he may have both hands.

The electrocardiograph confirmed Mackenzie's findings and enabled them to be extended. In this work Thomas Lewis, who had assisted Mackenzie, played a great part and was able to clear up some points which had not been fully understood. Thus the discovery of the fact that in a certain irregularity of the heart the auricles of that organ are no longer beating is due to Lewis. He named the condition "auricular fibrillation."

The following types of irregularity are described by Mackenzie:—

*Youthful Irregularity.*—The pulse varies with the breathing. It is quickened by inspiration and slowed by expiration. When the breath is held the irregularity disappears. This condition is occasioned by the vagus nerve which exercises a slowing influence on the heart. It is common in young persons and is of no evil significance.

*Extra Systoles.*—These are the popular "missed beats." They are not, however, missed beats at all, but beats which occur out of their normal time. The so-called "auricular extra systoles" are produced by the whole heart, both auricles and ventricles taking part; the "ventricular extra systoles" are produced by the ventricles only, the auricles beating at their normal time. These beats occur too soon and so the heart is not fully charged with blood. In consequence the beat may not be discernible at the wrist. The heart pauses after the beat to recover itself. There is then a big beat. Extra systoles in the absence of signs of cardiac failure may be ignored.

*Paroxysmal Tachycardia: Auricular Flutter.*—In this condition a period of abnormal rhythm suddenly occurs. The pulse rushes off and the patient is pulled up and feels a soft fluttering in his chest. A tracing shows that the auricles are beating more rapidly than the ventricles, only a few of the beats being followed by ventricular contractions. The auricles may achieve very great speed, even 300 beats a minute. The condition, as a rule, ends suddenly.

*Auricular Fibrillation.*—In this condition the patient suddenly becomes very unwell. His feet may swell and his liver dilate. He becomes breathless on exertion and may have much cyanosis. His pulse is often rapid and is always markedly irregular. There are small and big beats but no two beats are of the same length. Moreover the irregularity does not disappear on exertion as does that caused by extra systoles. A novel means of distinguishing this condition. The basis of the trouble is a fibrillation of the muscles which are no longer contracting in unison; the *a* wave could be described as the *p* wave in shreds. The condition appears to be due to some cardiac irritant; it frequently occurs in mitral stenosis—narrowing of the orifice of the mitral valve. In this disease a ring of muscular tissue has grown before the mitral valve of the heart and is caused by the rush of blood through the narrowed orifice. Under the stress

sion of the contracting auricles. When, however, auricular fibrillation begins this compulsion is removed and then the pre-systolic murmur is no longer heard. A curious point, too, is that patients who have suffered from attacks of angina pectoris before auricular fibrillation began seldom so suffer after its appearance. The condition is amenable to treatment. Mackenzie advises that digitalis is the drug for auricular fibrillation and that it must be exhibited in large doses, 15 minims four times a day, until the pulse slows down. Thereafter the drug must be stopped or, rather, given in small doses sufficient to maintain the slowing. The results of this treatment in favourable cases are remarkable.

*Heart Block.*—Stanley Kent and the junior His showed that there exists in the heart a neuro-muscular mechanism whereby stimuli pass from a node of tissue situated on the sinus venosus (and so known as the sino-auricular node), where they arise, to the auricles and ventricles. The means of their passage is the auriculo-ventricular bundle, a strand of fibres of neuro-muscular type which bifurcates and supplies a branch to each ventricle. In cases of disease this bundle may be affected and so the passage of stimuli be prevented. Thus the auricles and ventricles will be dissociated from each other.

*Partial Heart Block* occurs when the dissociation is not complete. In this condition only alternate stimuli may pass ("2–1 block") or only every third stimulus. The patient is apt to suffer fainting attacks and also a condition known as the Stoke Adams syndrome. This occurs when a period of more than 18 seconds elapses before a stimulus passes. It is characterized by a convulsion, by stertorous breathing and by the bringing-up of frothy expectoration. As the disease causing the block advances the dissociation becomes more complete and then, curiously enough, the ventricle takes on its own rhythm and beats regularly at about 40 to 50 beats per minute. The fainting attacks now pass away.

*Complete Block.*—Auricle and ventricle beat separately without relation to one another. The ventricular rate is slow (40 to 50). The auricular may be fast or normal. The patient may go on for a long time with this dissociated rhythm.

Block is not always caused by disease of the bundle. Certain infections and certain drugs may cause it temporarily. Treatment is not of much avail, but if the condition is diagnosed much may be done to prevent ill-effects from exercising their full force.

The main cardiac arrhythmies was elucidated by Mackenzie, Lewis and others. This work has now been accepted throughout the whole medical world. Lewis has pursued further the electrocardiographic study of arrhythmia and has recently suggested differentiation between "homologous" and "heterogenous" rhythms. A type of the former is the youthful irregularity; of the latter the extra systole auricular flutter and auricular fibrillation.

Not less momentous than the researches on cardiac irregularities was Mackenzie's contribution to the subject of *heart failure.* He pointed out that the study of valvular disease had been largely a study of sounds heard through the stethoscope. It was the habit of the profession to relate an abnormal sound to a supposed gross abnormality of structure—*e.g.* a broken valve and to make a prognosis on this supposition. This method led to many mistakes and even to abuses, for time had shown that patients with murmurs of various kinds might yet be well able to carry on active lives and even to live to old age without any symptoms of distress. It seemed therefore to be necessary to discover some more sure ground of diagnosis than that existing.

Mackenzie asked himself the question: "What is it that I am afraid of when I examine the patient?" The answer evidently was: "Heart failure." Thus a new direction was given to the assessment of the significance of cardiac symptoms. These symptoms were no longer to be accepted and read in terms of the post-mortem room. They were to be put to the test of their relationship with failure of cardiac power, that is to say of the myocardium or heart muscle.

The effect of this re-statement was an increased interest in such subjective symptoms as breathlessness and pain. These symptoms, it was remarked, vexed the patient as a rule when he attempted exertion, at which times one or other might make its appearance. The breathlessness seemed to be due to an excitation of the respiratory centre by lack of oxygen—weak circulation; the origin of the pain was more obscure. Mackenzie, however, called attention to the fact that in cardiac pain there is present as a rule an area of tenderness or hyperalgesia on the left side of the chest, below or surrounding the nipple. This is clearly a "referred" tenderness and corresponds to similar areas found in the skin of the abdomen in cases of visceral disturbance, *e.g.* gall-stone colic or appendicitis. The view was therefore formulated that the cardiac pain represented an effort of the heart to deal with large quantities of blood, that organ being incompletely prepared for its task. Thus the pain pointed to a weakness of the heart muscle.

The upshot of this work was a system of relating such findings as a murmur to the general state of the patient. Thus, if a murmur was heard and it was found that the individual was also breathless or suffered from marked pain and that these subjective symptoms were increased, a tendency to myocardial exhaustion might be inferred. If on the other hand the murmur was unaccompanied by symptoms its presence was not to be regarded as of so serious a character. This applied specially to systolic murmurs occurring at the moment of the cardiac beat and replacing the first sound. It applied also, however, to the two murmurs which are generally regarded as betokening organic disease, the presystolic murmur of mitral stenosis and the diastolic murmur of aortic disease.

In connexion with the presystolic murmur Mackenzie pointed out that when auricular fibrillation occurred this sign disappeared, leaving however a mid-diastolic murmur, which is also frequently found in mitral stenosis. The disappearance of the murmur is occasioned by the failure of the auricle to beat. In the case of aortic disease the accompanying hypertrophy of the heart is an important additional sign of muscle damage, even though the cause of the hypertrophy is by no means clearly understood.

Evidently the value of this method of determining the degree and progressive character of heart failure must lack in value without some system of correction and test. Mackenzie early apprehended this difficulty and set himself to supply the want. He conceived that in the last issue the proof of the danger or otherwise of a symptom is the after-life of its possessor. Consequently while still a young man he undertook the laborious task of following up a large number of patients during a long period of years.

The test was continued for some 20 years and its results then published in a series of books and monographs. A great many symptoms had been recorded in the first instance and their after-histories were therefore, when revised collectively, a commentary on the prognosis of heart affections of a unique kind, both as respects content and value. It was found that certain symptoms which had an evil reputation had not at all interfered with healthy life—an example is the systolic murmur met with in toxic persons; these murmurs are very frequent and the irritable type of hearts in which they appear is also a commonplace of the consulting-room. Mackenzie named the general condition "X-disease," because its exact nature was doubtful.

Another dreaded symptom which proved more or less without harm was the missed beat or extra systole. Another, the so-called *caput medusae* or group of injected venules seen on the margin of the ribs of many persons. Still another was the tendency to occasional palpitation or heavy beating of the heart after an acute illness.

On the other hand it was found that persons suffering from auricular fibrillation, attacks of true anginous pain (angina pectoris), from the curious cardiac rhythm known as *pulsus alternans* because every alternate beat is smaller, and from various forms of dyspnoea, tended to succumb at more or less early periods. In some cases, for example auricular fibrillation, much could be accomplished by proper treatment (digitalis); in others, for example *pulsus alternans*, little or nothing could be achieved.

This body of evidence is now at the disposal of the medical profession and constitutes a contribution of enormous value.

Another aspect of the cardiological problem, which was brought into prominence by the war, is the so-called "nervous or irritable heart." Attention was first called to this condition in 1915, when it was found by the British army medical authorities that a very large number of soldiers were being sent to hospital and being invalided out of the service on account of heart disease. The extent of the mischief was so great that it was rightly concluded that some inquiry was called for and application was made to the Medical Research Committee to take the matter in hand. Sir James Mackenzie, Dr. Thomas Lewis, Capt. Thomas Cotton and Dr. R. M. Wilson were appointed to study the cases. At a later date a committee consisting of Sir Clifford Allbutt, professor of medicine at Cambridge, the late Sir Wm. Osler, professor of medicine at Oxford, and Sir James Mackenzie was constituted, and a separate hospital, Mount Vernon, Hampstead, was set apart for soldiers with heart complaints. This hospital had on its staff, in addition to the above mentioned, Dr. Thomas Parkinson of the London hospital, Professor Francis Fraser now at St. Bartholomew's hospital, Professor Meakins now of Edinburgh University, Dr. Nigel Drury and others. A very prolonged and careful research was carried out.

The symptoms of the condition were found to be breathlessness on exertion, pain over the praecordium, exhaustion and giddiness and fainting. In addition palpitation was often complained of, as also were headache, lassitude, coldness of the extremities and irritability of temper. The signs, as opposed to symptoms, were increased heart rate, raised blood pressure in patients up and about, diffusion of the apex beat and irregularity of the heart's action. The temperature was frequently raised to 99° F. or to 100° F., such elevations being of a fleeting character. Respiration rate was also raised on exertion and tremor was the rule.

Lewis, who directed the research, gave to this picture the name of "Effort Syndrome" and wrote of it in an early publication:—"A generalization which has been shown to approximate to the truth in respect of the exaggerated rise of heart rate, blood pressure

and leucocyte count in response to exercise is that the rise in patient and control are identical, if the exercise is sufficient to produce in patient and control the same degree of respiratory distress."

In short these patients responded to stimuli in an excessive manner. The first method of dealing with them was an attempt to sort them out by means of graduated exercises and for this purpose an instructor was obtained. It was soon found that capacity varied a good deal but that it could be increased in certain instances by a judicious use of the exercises. It was soon discovered that the predominant etiological factor in the clinical histories of the cases was infection of one kind or another. In 558 patients the history of onset was definitely dated from rheumatic fever or chorea in 68 instances (or 12%), from dysentery in 14 instances, from typhoid fever and diarrhoea in 14 instances, from pneumonia, pleurisy and bronchitis in 25 instances, from pyrexia of unknown origin (trench fever in all probability) in 28, and from miscellaneous infections such as diphtheria, scarlet fever, syphilis and pus infections in 30 instances. In all these the first symptoms of the malady were definitely noticed during convalescence from the disease in question. The percentage covered is thus 33. But this by no means exhausts the importance of infection, for of the 376 cases which remain there was a history of rheumatic fever in 37 cases, of repeated joint pains in 8 cases, and of pleurisy, pneumonia, syphilis and other maladies in many more. Moreover, any intercurrent infection always had the effect of greatly increasing the severity of the symptoms. Further work in other hospitals has only increased the tendency to regard this malady as an extra-cardial one and to assign its cause to infection or, in a few instances, to gastro-intestinal troubles, shock and so on.

That irritable heart or "nervous heart" is found in civilian practice is certain, and that it constitutes a large proportion of so-called heart disease cases is equally beyond doubt. That it is not heart disease at all is becoming increasingly evident. Indeed the vital and even revolutionary part of this work lies in the fact that symptoms which have been associated with one kind of mechanism of origin are now seen to be capable of production by another kind of mechanism. In other words, breathlessness on exertion and cardiac pain may occur in the absence of any damage to the heart.

Thus it became necessary to re-investigate these symptoms. Numerous attempts have been and are being made. At one period, about 1919, a chemical theory held first place in interest. It was suggested that breathlessness was due to a lack of "buffer" salts in the blood. The idea was that the blood contains various salts and notably acid phosphate of soda, which are capable of absorbing either an excess of acid or of alkali. Thus the action of the buffer salt is comparable to that of a sponge. It was suggested that these cases of nervous heart were deficient in buffer salts and so lacked the means of preventing alterations in blood quality. This view was supported by a great deal of very delicate work but it has scarcely found general acceptance. An alternative view has recently been suggested to the effect that the blood lacks oxygen. It is pointed out that a general condition of venous stasis exists and that on this account a smaller quantity of blood passes through the lungs in a given time. The oxygen intake is lowered. In consequence during effort there is no great reserve of oxygen for use in the muscles and so more rapid and forcible breathing is rendered necessary in order to increase the supply. The stimulus here is not an excess of waste products but a lack of oxygen. Curiously enough there appears to be some ground for supposing that oxygen want is not in any sense synonymous with excess of carbonic acid gas. In the absence of sufficient oxygen the blood does not become less but rather tends to become more alkaline. This subject, however, is at present being further investigated. The researches of Haldane of Oxford and Barcroft of Cambridge must be mentioned in connexion with it.

The oxygen want is probably secondary to a nervous disturbance whereby the circulation is upset. In fact the evidence available at present points to an effect of the toxins of disease on the nervous system, and more especially on the involuntary nervous system. This system regulates the action of the heart and also the tone of the circulation. The smaller arteries are under its control and recent work, following that of Roy, suggests that even the capillaries may be supplied with nerves. It is, moreover, related in an intimate way to certain of the ductless glands and notably the supra-renals which produce adrenalin. The work of Gaskell has furnished a new conception of this system and it is now possible to recognise two main branches—the true sympathetic, the action of which on the heart is accelerator, and the vago-sacral sympathetic or parasympathetic, the action of which on the heart is inhibitor. It can easily be seen that any disturbance of the relationship existing between these branches of the involuntary nervous system must react not only on the efficiency of the heart and of its response to calls for increased effort but on the integrity of the whole circulatory tree. As point of fact the tendency to stasis or stagnation in many "nervous heart" cases is explicable only in terms of this nervous system.

In the same manner the origin of "cardiac" pain in these cases is probably to be related to the nervous system. How exactly the pain arises still remains in dispute. Enough that the pain is often excited by effort and tends to diminish if effort is abandoned. The fact that it usually disappears if the auricles of the heart begin to fibrillate has suggested to some workers that distention of these chambers by blood may act as the exciting cause.

The fact of immediate importance is that breathlessness, pain, palpitation, giddiness, exhaustion and the other symptoms of this series cannot be taken as of themselves indicating heart failure. They may all be present and yet the heart may be active and sound. Cardiologists have thus been compelled to reconsider the evidence on which a grave prognosis may be founded and have come to appreciate the great difficulties which beset their path. Indeed the tendency has become apparent to regard serious heart infection in a patient showing symptoms of the kind mentioned as the exception rather than the rule.

Nevertheless certain guides are available which should enable a reasonable opinion to be formed. If for example a patient has been suffering from a degree of limitation of the field of effort for a considerable period and if this degree is not exceeded it can be inferred that, whatever injurious agent is present, whether it be organic disease or a poison, the mischief is stationary. There is no "failure" in the true significance of that term. If moreover a sharp restriction of the field of effort is accompanied by signs of febrile illness and if the restriction is removed as the fever subsides a grave view need not be taken. But if a marked restriction occurs without evident cause this points in all probability to a weakening of the heart muscle. Again if dilation of the organ takes place and is progressive, or if auricular fibrillation supervenes, heart failure may be confidently diagnosed. In the last issue heart failure would seem to be always a muscle problem. The ultimate importance of extra-cardial factors is thus their influence on the burden which the heart is called upon to support. The heavier that burden and the weaker the organ (*e.g.* on account of organic disease) the earlier may failure be expected to show itself.

*Heart Flutter.*—The most recent contribution to the study of heart disease is that of Dr. Thomas Lewis on the nature of auricular flutter and auricular fibrillation. Lewis followed the experiments of Mayer in 1908 and of Mines in 1913. These workers used the contractile bell of the jellyfish and later rings of muscle cut from the ventricles of turtles and the auricles of teleostean fishes. The experiments were repeated in 1914 by Mines and Garvey on rings of muscle cut from the ventricles of the dog.

The experiments were as follow: If a ring of muscle was stimulated at a given point in its circumference by means of a single shock, a wave of excitation is set up. This wave develops two "crests," one goes round the ring in one direction, the other in the other direction. Necessarily they meet at a point. The whole ring has now become involved by the wave and has passed into a state of excitation. It has become "refractory," that is to say that for the moment it is no longer excitable by further shocks.

When therefore the waves of excitation meet one another on the circumference of the ring, movement is brought to an end. In Lewis's words: "like two waves of flame, two waves of excitation meeting do not override; each crest forms an impassable barrier."

The ring of muscle remains in this state of excitation (which is nearly though not quite synchronous with the state of contraction) for a period and then recovers. It recovers in the order in which it has become involved, that is to say it begins to be "responsive" again at the spot where the primary shock was applied. The responsiveness travels round the ring in two waves just as the excitability did. When the crests of these second waves meet the ring has returned to its original condition. It is wholly responsive.

Lewis uses the analogy of a prairie fire which can spread only in those directions in which unburnt grass awaits it. If, therefore, for any reason a portion of the ring of muscle happens to be "refractory" or in a state of excitability when a fresh shock is given only one wave of excitability may be able to travel. The fire, so to speak, is stopped by a patch of outburnt grass. Recovery of this refractory area may, however, have taken place before the new wave gets round to it. In that case the wave will continue to circulate, for when it returns to its starting point that starting point will have recovered its responsiveness. It is, indeed, as if the grass had grown again on the face of the prairie by the time the fire got back to it.

This curious condition of affairs is spoken of as a "circus movement" and it is in these circus movements that this investigator believes he has discovered the secret of auricular flutter and auricular fibrillation. For some reason the normal wave of excitability which should pass over the muscle of the heart is replaced by a wave travelling in a circle over the surface of the auricle. This wave follows, it would appear, the same circular path which it has mapped out for itself and then returns again to its starting point. There it meets muscle which has so far recovered as to be responsive once more, and thus the wave keeps on travelling round and round. Subsidiary waves are sent out. The rotatory journeys of this over the muscular surface and the auricle beats at the rapid rate which is characteristic of the clinical condition.

Lewis has been able to induce fluttering of the auricles experimentally in dogs and has been able to prove that this is the same condition as that encountered in the human subject. Flutter, he declares, "consists essentially of a circumscribed circulating wave." The path taken by this wave is not always the same but is fixed. In the dog an artificial flutter may last for hours; in man flutter may

last not hours but years. A "single wave continuously circulating for seven years," Lewis pointed out, "may seem to be a remarkable conclusion; nevertheless, it is one we are now bound to accept."

It is evident that the permanence or impermanence of this circulating wave of excitability depends on the fact that the crest of the wave always finds recovered and so responsive muscular tissue in front of it—to revert to the analogy, the advancing crest of the fire always finds new-grown grass to burn. There is thus present, in auricular flutter, a "gap" of recovered or responsive muscle between the refractory or excited portions and the crest of the oncoming wave of excitability. This gap moves round and round the ring just as the wave of excitability does. The grass in fact grows up as quick as it is burnt down—there is always a patch of it for the flames. Upon the continued presence and integrity of this gap the permanence of the flutter depends. So long as the gap is there the wave will circulate; so long as there is grass the fire will burn. But if the gap could be closed the flutter would—must—stop at once.

The same description applies to fibrillation except that the circus movement here is less well defined in its quality and the wave motion more diffuse. It will be seen that the experimental work has led to the door of the sick-room, so to speak, and that Lewis's view of the "gap" is probably justified: "it is a gap which will command the attention of many workers in the near future, for upon our power to influence its length, our success in treating flutter and the closely allied condition, fibrillation, will very largely depend."

(R. M. Wi.)

**HEAT** (*see* 13.135).—Progress in the science of heat on the experimental side during 1910–21 was necessarily slow, because time and opportunity were lacking during the World War for the laborious work which solid progress entails. Some valuable researches, for which provision was made before the war, were subsequently brought to a successful conclusion, but many of the minor details, which taken in the aggregate constitute a considerable addition to knowledge, had not been made available by 1921 in a digested form suitable for reference. Speculative theories, on the other hand, which require no apparatus or elaborate preparation, have flourished the more abundantly in the absence of effective checks and exact verification. The summary of recent works, given below, is arranged for convenience as far as possible in the order of the earlier articles connected with heat, in the 11th ed. of the *E.B.*, as enumerated in 13.157, and references to them are made where necessary.

*International Notation.*—The symbolic notation here adopted is based on that recommended by the International Commission for the Unification of Physico-Chemical Symbols at their meeting at Brussels in 1913, as extended by a special Committee of the Physical Society of London under the presidency of Sir J. J. Thomson. Fortunately their recommendations coincide in the main with the notation employed in the 11th ed. of the *E.B.*, but a few changes have been made for the sake of uniformity, as indicated in the following list.

*Alphabetic Index of Symbols.*

A = 1/J, Reciprocal of mechanical equivalent of heat.
*a*, Numerical factor for reducing PV to heat units.
B, Constant of integration in expressions for E and H.
*b*, Covolume in characteristic equation of gas.
C, Cooling-effect of Joule and Thomson (*see* 27.901).
*c*, Coaggregation volume in gas-equation.
E, Intrinsic energy.
G, Gibbs' function, T*φ*—H.
H, Total heat of vapour, E+*a*PV.
*h*, Total heat of liquid.
J, Joule's equivalent.
K, *k*, Thermal Conductivity, and Diffusivity.
L, Latent heat.
M, Mass.
*m*, Molecular weight or mass-flow.
N, Number of atoms or molecules.
*n*, Index in formula for *c*.
P, Pressure generally.
*p*, Saturation-pressure.
Q, Quantity of heat energy.
R, Gas-constant in PV=RT.
S, Specific heat of vapour; *s*, of liquid.
T, Absolute temperature; t, from 0°C.
U, Velocity of motion.
V, Specific volume of vapour; *v*, of liquid.
W, Work.
X, Cross-section of pipe or nozzle.
*φ*, Entropy of vapour; *ψ*, of liquid.
*σ*, Radiation constant in *σ*T⁴.
*ω*, Ratio of the two *c*'s of gas.
Λ, Velocity of light, 3×10¹⁰ cms./sec.
*λ*, Wave-length; *ν*, frequency.
*η*, Viscosity of gas.

## Calorimetry.

*Units of Heat.*—One of the most fundamental points in the measurement of heat is the relation between the practical units corresponding to the various methods discussed in the earlier article (*see* 5.60), in which the most important experimental evidence then available was described and reviewed. Some of the conclusions reached have since been contested, but additional experimental evidence has been obtained which seems to confirm the views previously maintained.

The experiments of Rowland by the mechanical method, agreeing closely with those of Joule when reduced to the scale of the gas thermometer, showed that the gram-calorie at 20°C. (defined as the quantity of heat required to raise the temperature of 1 gram of water at 20°C. under atmospheric pressure by 1°C. on the scale of the hydrogen thermometer) was equivalent to 4·180 joules of mechanical energy. Those of Reynolds and Moorby between 0° and 100°C. gave the equivalent of the gram-calorie as 4·1832 joules for the mean of the whole range, showing that the mean calorie was nearly the same as the calorie at 20°C., in contradiction to the results of earlier experimentalists who had obtained much higher values for the mean calorie. The best of the previous results by the method of mixtures for the variation of the specific heat of water between 0° and 100°C. were those of Lüdin (*see* 5.64, fig. 6), which gave a somewhat improbable curve for the variation, indicating a value 4·206 joules for the equivalent of the mean calorie, if the calorie at 20°C. was equivalent to 4·180. Most of the older results for the mean calorie, *e.g.* those of Dieterici (*Wied. Ann.*, 33, p. 417, 1888), giving 4·244 by an electrical method with an ice-calorimeter, were much higher than Lüdin's. On the other hand, the continuous electrical method (*see* 5.65), in which platinum thermometers were employed in place of mercury thermometers, while agreeing very closely with Rowland's results from 5° to 30°C., gave a much slower rate of increase than Lüdin's for the specific heat between 40° and 100°C., and a value 4·186 joules for the mean calorie, confirming Reynolds and Moorby.

The later experiments of Dieterici, by the method of the ice-calorimeter employing a 10 times smaller current with a coil of higher resistance in order to reduce the uncertain errors of the electrical measurement, gave an equivalent 4·192 joules for the mean calorie. He also redetermined the constant of the ice-calorimeter, using water at 100°C. sealed in thin bulbs of quartz-glass, and obtained a value 15·491 milligrams of mercury per mean calorie, appreciably higher than the value 15·44 previously employed. This has since been confirmed by E. Griffiths (*Proc. Phys. Soc.*, 26, p. 1, 1913) who found the value 15·486 for a mean calorie of 4·184 joules. Owing to the smallness of the quantities of heat available for measurement at low temperatures, the ice-calorimeter is unsuitable for investigating the variation of specific heat in the neighbourhood of the freezing-point, but the observations of Dieterici at temperatures above 100°C. by the same method gave a rate of increase of the specific heat of water slightly exceeding that found by Regnault, which could not be reconciled with Lüdin's curve showing a maximum of specific heat at 87°C. On the other hand, Messrs. W. R. and W. E. Bousfield (*Phil. Trans.*, A, 211, pp. 199–251, 1911) succeeded in reproducing Lüdin's results with remarkable fidelity by a most ingenious method of electric heating with a vacuum-jacket calorimeter. The heating-coil consisted of a long spiral of small-bore glass tubing filled with mercury, the expansion of which in a capillary tube was made to indicate the actual temperature of the mercury at any time when traversed by the electric current. The observers were thus enabled to avoid the source of error due to the superheating of the conductor above the temperature of the calorimeter. The uncertainty of heat-loss by evaporation from the surface of the water was minimized by protecting the surface with a cover in the form of a metal box maintained as nearly as possible at the same temperature as the water during an experiment. The rise of temperature over predetermined ranges, 0°–13°, 13°–27°, etc. was observed with suitable mercury thermometers of limited scale, standardized at the National Physical Laboratory. The corresponding quantities of electrical energy supplied, when corrected for external heat-loss and for the thermal capacity of the calorimeter, gave the increase of total heat of water, or the mean specific heat over each range. By adding the increments of total heat for each range, the *variation* of the total heat *h*, or the small difference *h* − *t*, could be obtained at each of the points of observation, as in the following table—

| Temperature C. | 13° | 27° | 40° | 55° | 73° | 80° | 100° |
|---|---|---|---|---|---|---|---|
| Bousfield | 0·058 | 0·058 | 0·056 | 0·124 | 0·242 | 0·306 | |
| Lüdin | 0·058 | 0·060 | 0·060 | 0·126 | 0·238 | 0·317 | 0·533 |
| Formula (1) | 0·058 | 0·060 | 0·060 | 0·126 | 0·238 | 0·317 | 0·533 |
| Dieterici | 0·0580 | 0·0610 | 0·0620 | 0·1270 | 0·2400 | 0·3210 | 0·5400 |

Bousfield's observations did not extend beyond 80°, owing to the difficulty of excessive evaporation with an open calorimeter. According to his curve, the corresponding values of the specific heat appear to be approaching a maximum at 80°C, a little lower than that shown by Ludin's curve. The value of the specific heat at 80°C, according to Ludin's formula, is 1·0164 in terms of the specific heat at 20°C. taken as unity, and exceeds the value given by the continuous electric method by 0·53%. This looks alarming at first sight, but the method of comparison in terms of the actual specific heat, though commonly adopted, is really unfair, because the quantity actually observed in Ludin's method is the total heat, which shows a difference of only 0·31 calorie according to the above table at 80°C. Dieterici's observations at 100°C., where they were most reliable, differ by only 0·14% from the continuous electrical method, and he does not claim an order of accuracy greater than 0·1% for the ice-calorimeter.

According to Bousfield's experiments, the absolute value of the mechanical equivalent of the calorie at 20°C. is 4·1752 joules. He attributes the discrepancy between this value and the value 4·180 given by the continuous electric method to the uncertainty in the electromotive force of the Clark standard cell, the value of which was commonly taken in 1900 as being 1·4342 volts at 15°C., which has since proved to be erroneous. Thos Watts and Waters (U.S.A. Bureau of Standards, vol. 4, p. 64, 1907) found the value 1·4339 for Clark cells of the type employed in the continuous electric method, which would exactly account for the discrepancy. It should be observed, however, that the electromotive force of the actual cells employed was determined at the time with a specially designed electrodynamometer (*Phil. Trans.*, A, 1902, p. 81), and was found to be 1·4334 volts at 15°C., which was used in place of the legal value 1·4342 volts in deducing the absolute value 4·180 joules for the equivalent of the calorie at 20°C. The same electrodynamometer was employed 15 years later by Prof. Norman Shaw (*Phil. Trans.*, A, 1914, vol. 214, pp. 147–198) without any modification, in determining the electromotive force of the Weston cell. In the course of this work he verified the constants of the coils and the theory of the instrument with a very high order of accuracy, so that there can be little doubt that the value 1·4334 found for the Clark cells at 15°C. was substantially correct.

*Continuous Mixture Method.*—Since the number of separate determinations of the specific heat of water at points between 50° and 100°C. by the continuous electric method was only 12, and since these were made under conditions of exceptional difficulty and differed most widely from the values found by Ludin and Bousfield, it was felt to be desirable to confirm the variation in this region by an entirely independent method of equal accuracy. The continuous mixture method (Bakerian Lecture, *Phil. Trans.*, A, 1912, vol. 212, pp. 1–32) was devised for this purpose, and consisted in passing a steady current of water, initially at 100°C., through an interchanger, in which it gave up a large part of its heat to a current of cold water initially at 25°C., emerging at a temperature in the neighbourhood of 70°C., without having actually mixed with the cold current. The same current was then cooled to an accurately regulated temperature in the neighbourhood of 25°C., and reëntered the interchanger as the cold current. The point of the method is that the circulation is continuous, so that the water equivalent of the interchanger is not required, and that the hot and cold currents are *the same*, so that the quantity of the current divides out of the equation (except in the small term representing the external heat-loss), and need not be determined with an accuracy greater than 1%, since the external heat-loss can easily be reduced to a small fraction of 1% of the heat-exchange between the currents. The actual temperatures $t_1$ and $t_2$ of the hot current on entering and leaving the interchanger, and those of the cold current, $t_3$ and $t_4$, were observed with platinum thermometers to 0·01°C. If $s$ is the mean specific heat of the hot current between $t_1$ and $t_2$, and $s'$ that of the cold current between $t_3$ and $t_4$, we have the equation

$$s(t_1-t_2) = s'(t_4-t_3) + X/M,$$

where $X$ is the external heat-loss in gram-calories per second, and $M$ the value of the water current in grams per second. The heat-loss was determined, as in the continuous electric method, by varying the flow $M$ while keeping the temperatures the same. In a large number of trials it was found that the ratio of $s$ to $s'$ agreed with the value 1·0050 given by the continuous electric method, but disagreed materially with the value given by Ludin's formula. It was concluded that the discrepancy from Ludin's formula was probably to be attributed to the unavoidable errors of the method due to losses by evaporation at temperatures above 50°, and to the uncertainties of zero and stem-exposure which cannot be eliminated in the employment of mercury thermometers.

*Formulæ for the Specific Heat of Water.*—It is found to simplify an empirical formula of the type $s = a + b(t-20)^2 + c(t-20)^3$, which is familiar and convenient for the application of the method of least squares to the results of observation, by introducing more often quoted for water are those of Ludin and Dieterici, which, as follows in terms of the mean specific heat between 15° and 20°, are

Dieterici . . . $1 + 0{\cdot}0000\,4(t-37{\cdot}5)^2$ (between 0° and 75°)

The probable errors of the coefficients, as found by Ludin, are shown in the line below his formula. The formula of Dieterici represents his observations satisfactorily from 0° to 60°C., but does not apply to the variation near the freezing point, which cannot be represented satisfactorily by this type of formula without an additional term. The formula of Ludin is fairly accurate between 0° and 25°, but appears to give results about ½% too high between 60° and 90°. It is also inconvenient in practice, because the coefficients are large and of opposite signs, giving the small variation required as a difference between relatively large terms. In the preliminary reduction of the results of the continuous electric method (*Ph. A.*, Sept., 1899), it appeared that a formula of this type would be unsuitable, and the observations were accordingly represented by three simple formulæ for different ranges of temperature, between 0° and 100°C., as given in the previous article (eq. 5166). These have since been combined into a single equivalent formula, which is more convenient for several purposes:

$$s = 0{\cdot}98536 + 0{\cdot}304/(T+20) + 0{\cdot}0084/(T/100)^6 + 0{\cdot}009(T/100)^{20} \quad (1)$$

The value of the constant is adjusted to make $s = 1$ when $T = 20$. The other terms are small and positive, and can be calculated with sufficient accuracy for all possible purposes by means of a 10-in. slide rule. This formula agrees very closely with the table previously given, but represents a later and more accurate reduction. It is of no theoretical significance, and cannot safely be extrapolated much above 100°C., but still agrees very closely with Regnault's observations at 150°C. Above 100°C. it is better to use the hyperbolic formula (eq. 27·013) suggested by Mr. G. Gray, which agrees very closely with experiment from 40° to 100°C., but does not represent the increase of specific heat with fall of temperature near the freezing point. Gray's formula was re-derived by Callendar in representing the change of total heat of water under saturation pressure, and then agrees very closely with the observations of Dieterici at high temperatures, when corrected to give the change of total heat in place of the intrinsic energy. It has a simple theoretical foundation, and greatly simplifies the thermodynamical relations between liquid and vapour. There is good reason, to believe (Callendar, *Properties of Steam*, pp. 100, 196) that it continues to hold satisfactorily right up to the critical point, where the specific heat becomes infinite.

By experiments on the supercooled liquid, Prof. H. T. Barnes has shown that the increase of specific heat with fall of temperature continues to follow the same curve above and below the freezing point. By very accurate experiments on mercury, using the continuous electric method, he has shown that a diminution in the specific heat with rise of temperature occurs as in the case of water, but persists up to a minimum at 140°C. It appears probable that a similar phenomenon would be found for all liquids at low vapour pressures, but it is masked in the case of volatile liquids by the opposite effect of the vapour molecules, as represented by the thermodynamical formulæ. The diminution of the specific heat of water was attributed by H. A. Rowland to the presence of a small proportion of solid molecules in the liquid near the freezing point. The small increase of the specific heat of a solid as the freezing point is approached may similarly be attributed to the presence of a small but rapidly increasing proportion of liquid molecules in the solid. The proportion required in either case, to explain the diminution of hardness and rigidity of the solid, or the anomalous expansion of water near the freezing point, is small, but cannot be calculated with certainty on account of our imperfect knowledge of molecular forces and dimensions. Such a theory would be difficult to verify in any case by experiment for the liquid and solid molecules. On the other hand, the latent heat of the vapour molecules in the liquid, according to the thermodynamical formula, is simply that of a volume of saturated vapour, equal to that of the liquid, and easily calculated.

*Specific Heat of Gases and Vapours.*—The continuous electric method was first applied in the case of steam (*see* 27·091), and gave results near 100° corroborating Regnault's value at higher temperatures. The same method was applied to air and $CO_2$ by H. L. Callendar and J. T. Nicolson (*Proc. Roy. Soc.*, A, 1910, vol. 83, p. 301), and to steam, $CO_2$, air, and $SO_2$ by A. Grace and H. L. Callendar (*Phil. Trans.*, A, 1910, vol. 210, p. 169), who found results from 2 to 5% higher than those of Regnault. Swann's formula has since been verified by Holborn and Jakob (*Ann. der Physik*, 1918, p. 1499, 1918) and is now generally recognised as the best method to be used for the determination of the specific heat of any fluid at constant pressure. Swann's values for air at 0° and 100°C. agree closely with those of Joly at constant volume (*see* 5·63), and give a ratio of specific heats very nearly equal to 1·40, as required by the kinetic theory for a diatomic gas. They also showed a very small increase with temperature, at the rate of only one-half of 1% for 100°C. This is shown for CO₂ and air, with Regnault's constant, the rapid increase with temperature found by Regnault and Winkelmann for the gases which contain an OH group, which amounts to 12% for 100°, is not found in the case of steam. This increase of specific heat was encountered for the first time in the theory which explained the departures from the gaseous laws shown by the gases mentioned above, and which contain constant terms in the specific heat. This discovery also was explained (H. L. Callendar, *Phil. Trans.*, A, 1910, p. 1) by assuming that the natural frequency of the gaseous molecule must be outside the electric absorption bands, but relatively close to the natural frequency at each temperature. It was shown that a natural frequency

having a wave-length of the order of 15 microns would be competent to produce the observed effect in the case of $CO_2$, contributing, when fully excited, a term R to the specific heat. An attempt was accordingly made to investigate the relation between the variation of the specific heat of gases and the absorption and emission bands in their infra-red spectra. Some qualitative agreement was found, but it was very difficult to make quantitative measurements of the kind required, or to frame a consistent theory. For instance, there is a strong band at 4·4–4·5 microns both in the emission and absorption spectra of steam. This band corresponds to the maximum ordinate of the wave-length spectrum of full radiation at a temperature T=647°C., which is the critical point of water, and appears to be closely related to other properties of steam, such as the latent heat and the cooling-effect, and the variation of the specific heat with pressure. There is no doubt that the properties of any substance must be intimately related to the natural frequencies of the molecules, but the form of the relation cannot be predicted with certainty; the experiments were interrupted by the war, and the quantitative measurements, up to 1921, had not been sufficiently exact to distinguish between many possible hypotheses.

The experiments of A. Eucken (*Sits. Akad., Berlin*, 33.1, p. 141, 1912) on the specific heat of hydrogen at low temperatures were very instructive in this connexion. The gas was electrically heated at various temperatures in a thin steel vessel under considerable pressure at constant volume. The specific heat was found to diminish from nearly 5R/2 at ordinary temperatures to nearly 3R/2 at T=60°, after which it remained practically constant down to T=35°. The fall could be approximately represented by a formula of the Einstein type, $Rf(\epsilon)$, as explained in the next section, with a value $\beta\nu=430$, corresponding to a wave-length of about 32 microns. The experiments were undoubtedly of considerable difficulty, owing to the large thermal capacity of the steel vessel, and its rapid diminution with fall of temperature, but there seems no reason to doubt the substantial accuracy of the result. In the kinetic theory of the specific heat of a diatomic gas, the term 3R/2 is attributed to the three degrees of freedom of translation, and the term R to the two of rotation, the energy of which must be exactly proportional to that of translation, if the effect is produced by collisions. The late Lord Rayleigh was never satisfied with this explanation, which evidently must be revised if Eucken is correct.

*Specific Heat of Solids at Low Temperatures.*—The early experiments of Sir J. Dewar, Sir W. A. Tilden, and others, had shown that solids at low temperatures deviated from Dulong and Petit's law of the constancy of atomic heat in the same way as carbon, boron, and silicon, at ordinary temperatures, but they failed to show the full extent of the deviation, or to indicate a probable explanation. A great impetus to research in this direction was given by the suggestion of A. Einstein (*Ann. Phys.*, 22, p. 180, 1907) that the atom of a solid might be regarded as an electric resonator with three degrees of freedom possessing a particular frequency, independent of the temperature, and capable of responding to the same frequency of radiation. Adopting Planck's theory and radiation formula, he showed that the specific heat at constant volume should approach the limit 3R=5·94 calories per gram-atom at high temperatures, as required by Dulong and Petit's law, but that the variation at low temperatures should be given by the expression—

$$s=3R\epsilon^2e^\epsilon/(e^\epsilon-1)^2=3Rf(\epsilon) \quad . \quad . \quad . \quad . \quad (2)$$

where $\epsilon=\beta\nu/T=\beta\Delta/T$, as in Planck's formula. The symbol $\nu$ denotes the natural frequency of the atoms, and $\lambda$ the corresponding wave-length in cm. such that $\nu\lambda=\Delta=3\times10^{10}$, the velocity of light. The constant, $\beta\Delta=1{\cdot}460$, is Wien's constant of radiation. Taking H. F. Weber's observations on the variation of the specific heat of the diamond, extending from T=222° to 1258°, Einstein showed that they agreed qualitatively with this formula, if we could assume the diamond atoms to possess a single frequency corresponding to the wave-length 11 microns. Taking the substances, CaF$_2$, NaCl, KCl, CaCO$_3$, and SiO$_2$, for which the optical frequencies in the infra-red were known, he showed that the frequencies agreed in order of magnitude with those required by his formula, but that the observed wave-lengths were somewhat shorter than those calculated from the specific heats. This could be attributed to the fact that most of the substances showed more than one frequency, and that the frequencies were not strictly monochromatic, as indicated by the width of the corresponding absorption bands. In any case there were other effects, such as work of expansion, included in the specific heats as ordinarily measured, and it might be doubted whether the optical frequencies corresponded exactly with the thermal vibrations of the atoms.

An important series of experimental measurements, extending down to the temperature of liquid hydrogen, was made by W. Nernst, F. A. Lindemann, and their collaborators (*Sits. Akad., Berlin*, p. 494, 1911), on a number of metals and other solids, including those for which the optical frequencies were known. They found, as already indicated, that Einstein's formula gave too low values for the specific heats at low temperatures if the optical frequencies were assumed in calculating the value of $f(\epsilon)$, and that much better agreement could be obtained by taking the mean of $f(\epsilon)$ for the optical frequency, and a similar term, $f(\epsilon/2)$ for half the optical frequency, [illegible]

$$s=3R[f(\epsilon)+f(\epsilon/2)]/2=3Rf'(\epsilon) \quad . \quad . \quad . \quad (3)$$

The same function, $f'(\epsilon)$, of $\epsilon$ was assumed to apply to other substances, such as the metals, but the appropriate values of $\epsilon$ were selected to fit the observations on the specific heats. Some substances, such as SiO$_2$ (in the forms of quartz and quartz-glass) and benzine, C$_6$H$_6$, which gave a different type of curve, were represented by formulae with two or three different values of $\epsilon$, each value of $f'(\epsilon)$ being multiplied by a fractional coefficient representing the proportion in which the corresponding molecule was supposed to be present. But such cases could not be regarded as a verification of the theory, because it would obviously be possible to represent almost any type of variation in this way. Einstein objected that even the simplest of these formulae, namely (3), was too empirical to be satisfactory from a theoretical standpoint; that a cubical crystal, such as KCl, or NaCl, could not have two different frequencies; and that there was no evidence in either case of an optical frequency with half the experimental value, since, according to Rubens, the crystals became again transparent before this frequency was reached, and had a value of the refractive index which was nearly normal. He also indicated two other objections to the "quantum" theory on which Planck's formula was based. (1) According to the quantum theory it did not follow, as required by the classical mechanics, that the oscillator with three degrees of freedom would have three times the energy of a linear oscillator. (2) It was very difficult to conceive the distribution of energy among the oscillators at low temperatures required by the theory. Thus for the diamond at T=73° only one molecule in 100 millions would possess a single quantum of energy, all the rest would be absolutely quiescent. It was physically impossible to conceive such a distribution of energy, which moreover would make the thermal conductivity of the diamond at such temperatures entirely negligible, whereas, according to Eucken, it was nearly as great as that of copper at ordinary temperatures. For these reasons Einstein preferred to rely mainly on the expression for the energy of an electric oscillator in equilibrium with radiation as deduced from Maxwell's equations, and to regard Planck's formula for the distribution of energy in full radiation simply as representing the results of experiment, without reference to the special hypothesis of quanta, which was subsequently invented to provide a theoretical explanation of the formula, but leads to serious difficulties in many directions.

*Debye's Theory of Specific Heat of Solids.*—The theory now most commonly accepted is that of P. Debye (*Ann. Phys.*, 39, p. 789, 1912), who attributes the heat energy to mechanical or acoustic vibrations of the solid with all possible frequencies up to a certain limit $\nu_m$. According to a theorem attributed to the late Lord Rayleigh (*Sound*, 1, p. 129, 1877) the number of possible degrees of freedom of a system of N discontinuous mass-points will be 3N. According to another theorem by the same author (*Phil. Mag.*, 49, p. 539, 1900), the number of possible frequencies in a given volume of a *continuous* medium between the limits $\nu$ and $\nu+d\nu$ may be represented by $C'\nu^2d\nu$, where C' is a constant depending on the volume and the velocity of propagation. The total number of possible frequencies from 0 up to a limit $\nu_m$ is $C'\nu_m^3/3$, if we equate this to 3N, we find $C'=9N/\nu_m^3$. Adopting Planck's expression for the energy of an electric oscillator with one degree of freedom as applying to each possible frequency of the N atoms in a gram-atom, we obtain the energy $(RT/N)\epsilon/(e^\epsilon-1)$ for each frequency. Multiplying this by the number of frequencies between $\nu$ and $\nu+d\nu$, namely $(9N/\nu_m^3)\nu^2d\nu$, and integrating from 0 to $\nu_m$, we obtain the energy of a gram-atom at T, from which the specific heat at constant volume is obtained by differentiation with regard to T. Unfortunately the integral cannot be expressed in finite terms and is too complicated to reproduce here. It is evident, however, that it will be a function of $\epsilon_m$ or $\beta\nu_m/T$, or $T_m/T$, where $T_m=\beta\nu_m$. Thus the *form* of the curve representing the variation of the specific heat (which depends on a single parameter $T_m$ or $\nu_m$) is the same for all substances on Debye's theory, if the temperature scale is altered for each in proportion to $\nu_m$. This point has been very carefully tested by E. H. Griffiths and E. Griffiths (*Phil. Trans.*, A, 214, pp. 319–357) for the metals Al, Ag, Cd, Cu, Fe, Na, Pb, Zn. Their results indicate qualitative agreement with the theory, but show characteristic differences, greatly exceeding the limit of experimental error, which may possibly be attributed to other effects not included in the simple theory. Thus the curve for Fe differs from that for Cu by nearly 20% between corresponding temperatures, which may be attributed to the magnetic properties of Fe. The curve for Na shows a rapid rise towards the melting point, reaching an excess of 3% above 3R, followed by a diminution of specific heat for the liquid, as in the case of water and mercury. Many simple compounds, such as NaCl, show curves of a very similar type to the metals, which has been used as an argument that the specific heat must be attributed entirely to the atoms, and that the free electrons supposed to exist in metals cannot make any appreciable contribution. Thus if there were two free electrons per atom, as required by some theories, the electrons alone would account for the whole specific heat according to the kinetic theory at ordinary temperatures, and it would be necessary to suppose that the number of free electrons diminished to zero at low temperatures, which would make it difficult to account for the enormous increase

in electric conductivity of pure metals demonstrated by Kamerlingh Onnes in the neighbourhood of the absolute zero.

One of the commonest objections to Debye's theory is the arbitrary nature of the assumption of an abrupt limit of frequency $\nu_m$. This assumption is made on account of its simplicity, but is highly improbable from a physical standpoint, though it might be expected to give results of the right order of magnitude. W. Sutherland (*Phil. Mag.*, 20, p. 657, 1910) had previously shown that the wave-length of the elastic vibrations of solids was of the same order of magnitude as the distance between the atoms for frequencies corresponding to the optical frequencies in the infra-red, so far as these were known. If the forces holding the atoms in place in a crystal lattice are electromagnetic, as commonly assumed, we should expect that the energy would be shared between matter and aether, and that the natural frequencies of the optical and mechanical vibrations would be the same. The wave-length and velocity of the natural frequency as measured outside the crystal would be reduced inside the crystal in the same proportion as the ratio of the velocity of light to that of an elastic vibration, or of the wave-length outside the crystal to the lattice constant, *i.e.* in the case of rocksalt, NaCl, about in the ratio $2\times10^{5}$ to 1. Since the energy in the cube of the wave-length remains constant, the energy-density of the external radiation of the natural frequency would be increased in the cube of this ratio, and would be of the right order of magnitude to explain the specific heat of the solid on the usual theory of resonance, as applied by Einstein. We have seen, however, that the assumption of Planck's radiation formula gives too low a value for the specific heat at low temperatures on Einstein's theory. If on the other hand we interpret Lord Rayleigh's formula, namely $C'T\nu^{2}d\nu$, as representing the partial *pressure* $pd\nu$ of radiation between the limits of frequency $\nu$ and $\nu+d\nu$, the latent heat of emission or absorption of radiation per unit volume between the same limits, according to Carnot's principle, is represeated by the expression,

$$T(dp/dT)=C'T\nu^{2}(1+x)e^{-x}, \quad . \quad . \quad . \quad (4)$$

and the total heat of a gram-atom of solid in equilibrium with radiation having this distribution of energy is given by,

$$H=3RT(1+x)e^{-x}, \quad . \quad . \quad . \quad (5).$$

The specific heat as ordinarily measured, when the external pressure is small as compared with internal pressure, will be simply,

$$s=3R(1+x+x^{2})e^{-x}, \quad . \quad . \quad (6).$$

This expression, unlike that similarly deduced from Planck's formula, gives good agreement with the observed value of the specific heat in the case of rocksalt, when the optical frequency corresponding to 51 microns is assumed, at a temperature corresponding to the maximum of the frequency curve, where $x=2\cdot732$, $T=100$, and $s=8\cdot67$ (doubled for a gram-molecule of NaCl). We should expect to get good agreement at this point, in spite of the fact that the actual vibrations in a solid cannot be strictly monochromatic (as Einstein pointed out) but extend for a distance of an octave or more on either side of the maximum, as indicated by the absorption spectrum. The effect of this is to reduce the steepness of the monochromatic curve, bringing it into good agreement with observation at high and low temperatures, without materially affecting the agreement at the mean point corresponding to the maximum of the frequency curve. If we assume the value $\lambda_m T=0\cdot290$ for the wave-length $\lambda_m$ (corresponding to the maximum ordinate of the wave-length spectrum of full radiation at T), in deducing the appropriate value of Wien's constant $\beta\lambda$ in formula (4), the maximum ordinate comes out the same as in Planck's formula, provided that the same value of the Stefan-Boltzmann constant $\sigma$ is assumed in the fourth power law $\sigma T^{4}$ for the total radiation. The two curves also agree so closely throughout their whole extent that it would be very difficult to decide between them by experiments on radiation. We should therefore be justified, according to Einstein's reasoning, in applying formula (4) in the deduction of the specific heat of a solid, especially when we find that the result gives such good qualitative agreement with the optical frequencies.

An obvious objection to Debye's theory in the case of transparent substances, such as quartz and rocksalt, is that, if the atoms have all possible frequencies below a certain limit, they ought to be completely opaque in this region, and to become suddenly transparent when the limit $\nu_m$ is surpassed. Experiment shows, however, that quartz, for instance, which begins to be opaque about four microns, and has optical frequencies corresponding to 8 and 21 microns approximately, and possibly one lower, becomes almost perfectly transparent below 200 microns. The variation of the specific heat is of an entirely different type to that given by Debye's theory, but corresponds closely, according to formula (4), with its optical frequencies. Ice and benzol, which are also transparent, show a variation of specific heat similar to quartz, according to Sir J. Dewar. The corresponding optical frequencies have not yet been observed, but it appears that water must have some frequencies below 200 microns to account for its transparency to the visible spectrum, and the variation of its specific heat. We should probably expect that the residual vibrations of an elastic solid, which are of the same kind as those of light, would be emitted as radiation, and would be intimately connected with the optical frequencies, as is quite possible, however, that the frequencies of the residual vibrations of a solid are of a different type, and propagated with a different velocity (that of sound), would continue to exist at low temperatures without affecting the transparency. Even atoms or molecules, though not capable of being excited directly by radiation, would be necessarily excited by the impacts of the molecules of the surrounding gas, with a distribution of energy corresponding to the Maxwellian law, and might be expected to provide a term in the specific heat of a somewhat similar character to the Debye term for compressional waves at low temperatures. It is noteworthy that Nernst and Lindemann in their latest deductions have found it necessary to retain the original Einstein term (4), for transparent substances in their formula (2), but have replaced the hypothetical term $f(\nu/\nu_0)$ by a term of the Debye type. The appropriate frequencies are calculated in most cases by Lindemann's semi-empirical formula from the molecular weight $m$, the atomic volume $V$, and the temperature of fusion $T_f$, but with different values of the constants for the two terms, as follows:—

$$\nu_0=2\cdot22\times10^{12}\,(T_f/m)^{\frac{1}{2}}V^{-\frac{1}{3}},$$

$$\nu_m=3\cdot08\times10^{12}\,(T_f/m)^{\frac{1}{2}}V^{-\frac{1}{3}}, \quad . \quad . \quad (7)$$

of which the first gives the optical frequency of Einstein and the second that of Debye. The cube root of the atomic volume is proportional to the lattice constant, and the elastic constants of a solid must be closely related to the temperature of fusion. Nernst and Lindemann assign equal importance to the two terms, but we should naturally expect from elastic theory, as given by Debye and other previous writers, that the numerical coefficients should have different values, and should be proportional to $1/v'^{3}$, for the compressional waves, where $v$ is the velocity of sound, and $2/v''^{3}$ for the torsional waves, where $v''$ is the velocity of light in the solid for the particular optical frequency considered. This may not fit so well with Planck's radiation formula for the Einstein term, but appears to give better agreement with experiment if formula (4) is substituted for Planck's. The appropriate frequencies cannot be calculated from the elastic constants for a discontinuous medium without introducing arbitrary hypotheses, which are unsatisfactory, because the effect of the hypothesis selected is most important at the point where the discontinuity commences, and it is difficult to avoid selecting an hypothesis to give the desired result. There is the further difficulty that the values of the elastic constants are somewhat uncertain, and liable to vary with temperature, and to depend on the particular specimen tested, especially with metals.

Sir J. Dewar (*Proc. R. S.*, 1913, A, 89, pp. 158–169) has measured the mean specific heats of the elements between the boiling points of hydrogen and nitrogen by means of his liquid hydrogen calorimeter. The results for the specific heats, when plotted against the atomic weights, give a curve showing a most remarkable coincidence with the well-known curve of atomic volume as a periodic function of the atomic weight. In other words, the specific heat is nearly proportional to the atomic volume, or to the cube of the lattice constant, for similar substances, at this low temperature, corresponding to a mean about $T=30°$. The relation does not pretend to be exact, though it is a fair approximation over the range 20° to 80°, but it illustrates the point that the atomic volume is the most important factor in determining the frequencies.

In the case of the metals, which are opaque to all frequencies below a certain limit, we should expect the possible frequencies to extend over a considerable range, and to be grouped about a mean in a similar way to the velocities of gas molecules on the kinetic theory. But there are many possible alternatives to the somewhat arbitrary hypothesis of Debye. We might suppose, for instance, that of N molecules in a gram-molecule, the number possessing the frequencies between the limits $\nu$ and $\nu+d\nu$ was represented by an expression of the type

$$(N/a)\,e^{-\nu/a}d\nu, \quad . \quad . \quad . \quad (8)$$

in which $x=\nu/\nu_0=\theta\nu/T=\beta\nu$, where $\alpha$ denotes $\theta_0/T$, and $\beta=1/T$. Multiplying this by expression (6) divided by N for the specific heat of a single molecule of frequency $\nu$, at a temperature T, and integrating the product from 0 to $\infty$, we obtain for the specific heat of a gram-molecule

$$s=3R\{2!/(1+\alpha)^{2}\}\{1+\alpha/(1+\alpha)+\alpha^{2}/(1+\alpha)^{2}\}. \quad . \quad . \quad (9).$$

This is much simpler than Debye's expression, but gives a very similar curve. The mean frequency, $\nu''=3\nu_0$, is nearly the same as Debye's limiting frequency. More accurately, Debye's characteristic temperature corresponds to $3\cdot51T_0$, in place of $3T_0$, on account of the difference in the values of the constant in which $\nu$ is the radiation term in Planck's and Rayleigh's formulæ for radiation. If Debye's scale is multiplied by $3\cdot51$, the curve agrees very closely with (9) from $\beta=0\cdot5$ to $\beta=1\cdot0$. Below $\beta=0\cdot5$, (9) agrees better with the Nernst-Lindemann curve (2), except that (9) tends to vary as $T^{3}$ at very low temperatures, instead of varying exponentially. Measurements by Eucken and Debye's theory a quantity corresponding to the [illegible] specific heats of [illegible] and sodium. This is very important, because (9) represents [illegible] of [illegible] that [illegible] the same as that of [illegible] all [illegible] the [illegible] [illegible] under the condition of [illegible] [illegible] equation. Thus in the case of [illegible] [illegible] [illegible]

between the same limits by only 0·001 cal. C., which is 100 times smaller than the limit of accuracy of observation; whereas the change of total heat at *constant volume* between the same limits in the case of water exceeds that of intrinsic energy by 21 cals., approximately; but the correction from constant volume to constant pressure is very uncertain, even in the best known cases. It therefore appears to be more logical to employ a formula giving the specific heat at constant pressure directly, in place of applying an uncertain correction. It should be observed, however, that (9) assumes the mean frequency $\nu_m$ to be independent of T, as in Debye's formula, which may be a good approximation in many cases, but cannot be exactly true if the molecule changes its state. Curve (9) reaches $c=3R$ a little above $\vartheta=2$, and attains a maximum 3·195 R at $\vartheta=4$, after which it falls with comparative rapidity to 3·048 R at $\vartheta=5$, tending to a limit 3R at $\vartheta=\infty$. The fall is of the right order of magnitude to explain the diminution of specific heat in the case of water, mercury and sodium. The distribution postulated in (8) appears to apply fairly to most of the metals, but it fails notably for many other substances. Such cases might be treated empirically by modifying the distribution, or assuming special frequencies, but such hypotheses would be of little value unless their physical meaning could be interpreted with reference to other properties of the substances.

## Conduction of Heat

In 1910 the very attractive theories of P. Drude and H. A. Lorentz were still commonly maintained, and were continually being applied to the explanation of electrical and thermal effects. According to their views a metal contained a number of free electrons moving in all directions with velocities corresponding to those of gas-molecules on the kinetic theory. Drude showed that this assumption led to an approximately correct value of the ratio of the thermal to the electric conductivity in the case of pure metals, and Lorentz showed that it accounted for the long wave radiation from hot bodies. There were numerous other applications of the theory which appeared to correspond in a remarkable manner with experimental facts, but there were also serious difficulties which appeared to render the adoption of such a theory premature.

The fluid state of scientific opinion on the subject in 1911 is well illustrated by the views expressed about that time by J. H. Jeans, one of the leading exponents of mathematical physics. In the report of the Solvay Congress, 1911, *On the Theory of Radiation and Quanta* (Gauthier Villars, Paris, 1912), assuming that there were two free electrons per atom of the metal, Jeans took the view that the specific heat of metals was entirely due to the movement of free electrons and not at all to the movements of the atoms, "a hypothesis which accords well with our knowledge of the internal movements of solids." On the other hand, in his report on the quantum theory (*Phys. Soc.*, London, 1914), he adopted the theory of Debye (according to which the specific heat was entirely due to the movements of the atoms) as probably "destined to be final," and concluded that the free electrons do not contribute sensibly to the specific heat. Sir J. J. Thomson, *Corpuscular Theory of Matter* (Constable, 1907), had already pointed out that the number of free electrons required to explain thermal and electric conductivity was too large to reconcile with the facts of specific heat on the assumption that the electrons possessed the same energy of agitation as gas-molecules at the same temperature, and had proposed an alternative theory (*loc. cit.*, p. 86) previously suggested in his *Applications of Dynamics to Physics and Chemistry* (1888). According to this view, the metallic atoms, owing to their close proximity in the solid state, were capable, under the influence of an electric field, of forming Captivus chains, along which they could exchange electrons. These were no free electrons in the sense contemplated by Drude and Lorentz, with velocities depending on the temperature and contributing to the specific heat, but the thermal agitation of the atoms tended to break up the chains, so that their number and length varied with the electric field in the manner required to explain the relation between electric and thermal conductivity and many other effects. In a later paper (*Proc. Phys. Soc.*, 27, p. 547, 1915) the same theory was applied to explain the striking phenomena of superconductivity discovered by Kamerlingh Onnes, who found that at very low temperatures (4° absolute) pure metals, a current once started might continue for days instead of stopping almost instantaneously on the cessation of the exciting field. According to J. J. Thomson's theory, it would naturally follow that, below a certain point, the thermal agitation would be insufficient to break up the chains when once they were formed, which would explain why it is that the electric resistance of most pure metals tends to vanish (apart from impurities) at a temperature *above* the absolute zero. A working hypothesis of this kind is very useful to the experimentalist as affording a mental picture of the physical conditions, and may help to explain the remaining difficulties with regard to the specific heats.

*Conductivity of Gases.*—Prof. Knudsen, who has made so many admirable contributions to the kinetic theory of gases on the experimental side, drew special attention (*Solvay Report*, p. 133) to the data for the thermal conductivity of gases, as being more scarce and discordant, owing to experimental difficulties, than determinations of other properties, and as requiring attentive examination for the elucidation of the law of action between molecules. The hot-wire method of T. Andrews (*Phil. Trans.*, 1840) offers special facilities for relative measurements, such as the comparison of conductivities of different gases, or of the same gas at different temperatures, and has frequently been applied with this object in recent years. It has also been improved by introducing the usual compensation for end-effects, and employing more accurate methods of electrical measurement. But it remains liable to the difficulties depending on the small dimensions of the wire, and the uncertainty of the corrections for convection and radiation. For these reasons the parallel plate method, adopted by E. O. Hercus and T. H. Laby (*Proc. R. S.*, A, 95, p. 190, 1918) for measuring the *absolute* conductivity of air, deserves special mention, owing to the great care with which the method was applied, and the complete elimination of convection effects. They also give a very complete reduction of previous results for different gases with the view of testing the value of the numerical coefficient $f$ in the relation, $k=f\eta s$, between the conductivity $k$, the viscosity $\eta$, and the specific heat $s$ at constant volume. According to the theoretical investigations of S. Chapman (*Phil. Trans.*, A, 211, p. 433, 1911) the value of the coefficient $f$ should be 2·5 for a gas constituted of spherically symmetrical molecules, which agrees with Maxwell's theory based on the inverse fifth-power law of force, and also with experiment for monatomic molecules. Unfortunately the variation of viscosity with temperature does not satisfy the fifth-power law, which requires that the viscosity should be directly proportional to T. The conclusion is that monatomic gases may have spherically symmetrical molecules, but that the law of force is different. Theory gives no clear indication with regard to the appropriate value of $f$ for other types of molecules. Experiment gives approximately a linear relation, $f=2·816\gamma-2·2$, between $f$ and the ratio of the specific heats. This gives $f=7/4$ for diatomic gases, which show fair agreement with each other. The experimental values for polyatomic gases are much less certain, and suggest the need of further investigation. The paper gives fairly complete references.

## Thermodynamics

Since the general principles of thermodynamics have not undergone any material change for the last 50 years, it will readily be understood that such progress as there is to record relates chiefly to matters of expression or convention, and to the practical application of the principles to engineering problems. The evolution of the steam turbine and the internal-combustion engine, along thermodynamical lines, has illustrated the importance of an exact and consistent theory of the conditions limiting the efficiency, and of an accurate experimental study of the properties of the working fluid in either case. Thus the improvement of the internal-combustion engine has depended greatly on the extension of the thermodynamical efficiency of the cycle by using higher compression ratios, which has necessitated careful attention to the reduction of heat-losses, to the properties of various fuels in respect of detonation, and to the specific heats of the products of combustion at high temperatures. The displacement of the reciprocating engine by the turbine for large power units has similarly depended on the possibility of improving the economy by utilising high vacua. The high speed of the turbine has directed special attention to the importance of losses due to friction and supersaturation, which depend on the rapidity of expansion. The turbine realises the ideal condition of steady flow, with an economic efficiency unattainable by the reciprocating engine. This has made it worth while for engineers to adopt the thermodynamical definition of total heat first proposed by Callendar in the year 1 of the 20th in place of Regnault's definition, which had sufficed for many

years, but continually gave rise to minor difficulties and complications when applied to the turbine. In the article cited, and as repeated in the 11th ed. (see § 6, 8, 11), the total heat was defined as the thermodynamic function $E+PV$, and was denoted by the special symbol $F$ in order to distinguish it from Regnault's total heat $H_1$ representing the quantity of heat added to the fluid under the condition of constant pressure equal to that of vaporization. By general convention, the symbol $H$ has now been defined as representing $E+PV$, a property of the substance depending only on the state, and the symbol $Q$ has been allocated to any quantity of heat added under special conditions.

*Equations of Steady Flow.*—These depend on the law of conservation of mass, and on the law of conservation of energy, of which they afford some of the simplest possible illustrations. If a fluid is flowing steadily at a constant rate $M$ (mass per second) through a circuit (pipe or nozzle) of variable cross-section $X$, at a point where the mean volume is $V$ per unit mass, and the mean velocity $U$ units of length per second, we have $MV=kUX$, where the constant $k$ is unity in any consistent system of units, *e.g.* if $U$, $X$, and $V$ are measured in ft., sq. ft. and cub. ft. respectively. It is common practice, however, to measure $X$ in sq. in., which must be reduced to sq. ft. by putting $k=1/144$; and similarly for other arbitrary systems. If we consider any two points (1 and 2) of a circuit for which $M$ and $X$ are known, the relation $MV=kUX$ makes it possible to determine either $U$ or $V$ at each point if the other is known. A second relation is obtained from the conservation of energy. Suppose for example that the points 1 and 2 represent the admission and exhaust of a turbine. When the flow is steady, for each unit mass entering at 1, unit mass must leave at 2. Unit mass entering at 1 carries with it its intrinsic energy $E_1$ and its kinetic energy $U_1^2/2g$, in addition to which work $P_1V_1$ is done by the pressure $P_1$ in forcing the volume $V_1$ into the turbine. Reducing these to heat units by the appropriate numerical factors, $a$ and $J$, we have for the total energy entering the turbine with each unit mass of fluid, $E_1+aP_1V_1+U_1^2/2Jg=H_1+U_1^2/2Jg$, where $H_1$ is the initial value of the total heat, which is always tabulated in heat units per unit mass. Similarly the total energy carried out per unit mass at 2 is $H_2+U_2^2/2Jg$. Since the total quantity of energy existing in the turbine remains constant when the conditions are steady, the excess of the energy carried in over that carried out must be equal to the external work $W/J$ done by the turbine together with the external heat-loss $Q_2$, both expressed in thermal units per unit mass passing through the turbine. We thus obtain the general equation representing the conservation of energy,

$$\text{Heat-Drop, } H_1-H_2=W/J+Q_2+(U_2^2-U_1^2)/2Jg. \quad . \quad . \quad (10).$$

The reduction factors, $a$, $J$, $g$, can be omitted for absolute or C.G.S. units, but it is better to retain them explicitly, because the various quantities can seldom or never be measured in absolute units in practical work, and the retention of the symbols saves much trouble and many mistakes.

In this equation, as applied to a turbine, the term $W/J$, representing the external work, is the most important on the right-hand side. The external heat-loss $Q_2$, and the leaving-loss, depending on the kinetic energy wasted in the exhaust, can be reduced to small corrections, which are readily applied. The external work is the equivalent of the corrected heat-drop, which can be calculated if the initial and final states of the steam are known. The equation takes exact account of any work wasted in internal friction, which does not appear explicitly in the equation because it affects both sides equally. The same equation can be applied to a reciprocating engine, or to any appliance admitting of steady flow.

Joule and Thomson (*Phil. Trans.*, 1854, 321; *Proc. R. S.*, 1856) were the first to employ the function $E+PV$ in their experiments on the flow through a porous plug or orifice. They discussed the various terms in the equation with great precision, but did not apply it to a steam engine, which was first done by Hirn and Rankine, though the equation is commonly attributed to Zeuner. In an ideal throttling experiment, such as that designed by Joule and Thomson, the equation shows that the total heat remains constant, $H_1=H_2$, provided that $U_1=U_2$ and that $W$ and $Q$ are negligible. The lines of constant total heat in the PT diagram can be determined by observing the initial and final values of $P$ and $T$ in a sufficient number of throttling experiments. It is then possible to deduce the actual values of $H$ under any conditions by measuring the specific heat and latent heat at any one pressure, preferably the highest for most fluids.

In applying this equation to the steam turbine Joule and Thomson showed that the kinetic energy of the issue was equivalent to the drop of $E+PV$, or $H$, which follows immediately from equation (10) if $W$ and $Q$ are negligible. In the ideal case, starting from rest, $U_1$ is negligible as compared with $U_2$, so that $U_2^2/2Jg$ is given by the adiabatic heat-drop. [illegible] For given conditions, $V_2$ is known in terms of $P_2$, and $P_2$, so that the discharge $M/X$ per unit area can be deduced by applying the relation $M/X=kU/V$. Joule and Thomson showed that the discharge would reach a maximum in the case of air under adiabatic conditions when the final pressure after passing the throat was 0·53 of the initial pressure, a result which had previously been deduced in a similar way by de St. Venant and Wantzel (*Comptes Rendus*, 1839) from Poisson's equation for the adiabatic, namely $PV^{\gamma}=$ constant. They also showed that the velocity of the discharge under this condition was simply related to the velocity of sound in the air at the original temperature and pressure, but they failed to interpret the relation. Osborne Reynolds (*Phil. Trans.*, 1886, p. 734), using the same equations for a perfect gas, showed that the velocity in the throat or minimum area of the stream was the same as that of sound in the gas under the same conditions, so that when this velocity was reached no further lowering of pressure beyond the throat could possibly increase the discharge. The same result is easily shown to apply to any fluid, either liquid or gas, in the absence of friction. The condition that $M$ is to be a maximum for a given value of $X$ gives $\delta(M/X)=0$, whence $\delta U/\delta V=U/V$. Eliminating $\delta U/\delta V$ by differentiating (11), we obtain, for isentropic flow ($\Phi$ const.)

$$U^2=-J_{\Phi}V(\delta H/\delta V)_{\Phi}=aJ_{\Phi}V^2(\delta P/\delta V)_{\Phi}, \quad . \quad . \quad (12)$$

which is the expression for the velocity of sound. This equation also gives the maximum discharge by substituting $M/X$ for $kU/V$.

In steady-flow calorimetry the drop of H between given initial and final states can be deduced from equation (10) by observing the quantity of heat $Q_2$ which must be abstracted, under conditions such that $W$ and $U^2$ are negligible. The pressure is usually constant, but if there is a large drop of pressure between the initial and final states, as in Regnault's experiments on the total heat of water, the difficulty is avoided, without changing $H_2$, by using a throttle, which is precisely what Regnault did, though he was unable, owing to the defective state of thermodynamics at the time (1847), to appreciate the exact effect of this proceeding. The same method can be applied for measuring the total heat of steam in any state, including the latent heat. In all cases of steady flow the quantity measured is the change of total heat, which is the most important property to determine for steam engines or refrigerating machines working on any modifications of the Rankine cycle. On the other hand the intrinsic energy $E$ is the property required for the constant volume cycle of the internal-combustion type.

A very simple and instructive illustration of the equation of steady flow is that of the temperature gradient in a fluid under gravity. If a current of air is flowing steadily upwards at a moderate speed, the external heat-loss $Q_2$ and the change of kinetic energy are negligible, and the drop of total heat is equivalent to the work done against gravity, giving $W/J=1$ calorie C. for each 1,400 ft. of ascent. This would evidently be the same for any fluid whatever. In the case of dry air the specific heat is nearly independent of the temperature and pressure, and the change of $H$ is equal to $S(t_1-t_2)$, where $S=0\cdot241$ is the specific heat at constant pressure. The drop of temperature will therefore be $1/0\cdot241=4\cdot15$°C. in 1,400 ft.; or the temperature gradient, 0·296°C. per 100 ft., which, however, is evidently quite independent of the initial temperature or pressure, or height, so long as we can afford to neglect the small variations of $S$ and $g$. In an ascending column of *damp* air, condensation sets in with formation of cloud as soon as the temperature falls below the dew point. The drop of $H$ remains 1 calorie per 1,400 ft., but the temperature gradient is greatly reduced by the liberation of the latent heat of the vapour. On the other hand, in a descending current, as in the ventilating shaft of a mine, the temperature increases with depth at the rate of nearly 3°C. per 1,000 ft., which, however, is usually much less than the natural gradient of underground temperature (due to outflow of heat through the earth's crust), which sometimes exceeds 10°C. in 1,000 ft. In this case there will be no condensation, but the air may be cooled by evaporation, if the mine is kept wet to reduce dust, as is usually the case.

According to equation (10) the rate of increase of temperature with depth, denoted by $dt/dz$, is equal to $g/JS$, and is independent of adiabatic flow if $S$ is constant. The *pressure* gradient, $dp/dz$, in gravitational units, is equal to the density $1/v$, or $g/JSt$. If $R$ is expressed, like $S$, in calories per 1°C. Dividing by $dt/dz$, we have $dp/dt=Sp/RT$, giving the adiabatic equation, which is commonly assumed as the starting-point to find the temperature gradient. But the reverse order is more instructive as showing why the temperature gradient differs in [illegible]

*Properties of Radiation.*—The flow of heat by radiation from one body to another at a lower temperature is the commonest case of *steady flow*. Owing to the high velocity of radiation and the absence of thermal capacity in the circuit, the steady state is established in a small fraction of a second, if the temperatures of source and sink are constant. The quantity measured in a radiating experiment is [illegible] the energy $E$ of the radiation, as is frequently assumed, but [illegible] the flow of heat $H$ [illegible] the case of radiation, as in [illegible] the [illegible] the [illegible] the

second from a black body or perfect radiator at a temperature T, and is denoted by $\sigma T^4$, where $\sigma$ is the Stefan-Boltzmann constant of full radiation. By the geometrical conditions of the problem, the quantity $\sigma T^4$ is 1/4 times the latent heat per unit volume, or 1/3 times the energy-density in an isothermal enclosure at T, where A is the velocity of light. The qualitative verification of the fourth-power law requires only a receiver capable of giving correct relative values of the radiation received, and is now generally accepted as satisfactory; but the absolute measurement of the value of the constant $\sigma$ is a much more difficult problem, which has frequently been attacked in recent years without obtaining so high a degree of concordance as is desirable in so fundamental a research. The value $5.32\times10^{-5}$ ergs per sq. cm. per second, found by F. Kurlbaum in 1898 (*see* 13.155), was accepted for several years, though it rested on a somewhat doubtful value of the absorption coefficient of the bolometer. Moreover, the assumption that the radiant energy measured was equivalent to the electric energy required to produce the same rise of temperature in the bolometer, was rendered somewhat uncertain by conduction effects at the ends of the strips. A similar bolometer, with the end-effects compensated, as employed in the solar eclipse of 1905, gave the somewhat higher value $5.60\times10^{-5}$. Kurlbaum (1912) gave the corrected result $5.45\times10^{-5}$. F. Paschen and W. Gerlach, by a modification of Ångström's method (*Ann. Phys.*, 38, p. 41, 1912), found the value $5.80\times10^{-5}$, which was confirmed by G. A. Shakespear (*Proc. R. S.*, A, 86, p. 180, 1912), and by H. B. Keene (*Proc. R. S.*, A, 88, p. 49, 1913), who found $5.67\times10^{-5}$, and $5.89\times10^{-5}$, respectively. W. Coblentz (*U.S.A. Bur.* 12, p. 553, 1916), by a method similar to that of Paschen and Gerlach, found the value $5.72\times10^{-5}$, which is a fair mean of the previous results. One of the most promising methods is that of the radio-balance (*Proc. Phys. Soc.*, 23, pp. 1–34, 1910), in which radiation received through a measured aperture is completely absorbed in a small copper cup, and is compensated by the Peltier cooling-effect due to a current through a thermojunction. Unfortunately, these experiments were interrupted by the war, and the final reductions have not yet been completed. There seems to be little doubt that Kurlbaum's original value was too low, but there are many pitfalls in such difficult experiments, and most of the methods adopted are liable to some objections.

It is generally admitted that the distribution of energy in the spectrum may be represented within the limits of experimental error by Planck's formula (*see* 13.156), namely,

$$E_\lambda d\lambda = C'\lambda^{-5}d\lambda/(e^{c'/\lambda T}-1), \quad . \quad . \quad . \quad (13).$$

If this formula is integrated from 0 to $\infty$, and equated to $\sigma T^4$, assuming that it represents the distribution of energy in the spectrum as observed experimentally, we find for the constant C', in terms of $c'$ and $\sigma$, $C' = 15\sigma(c'/\pi)^4$. The value of the distribution constant $c'$ is most readily deduced from the wave-length $\lambda_m$ corresponding to the maximum ordinate of the energy curve at T, since by Wien's law the product $\lambda_m T$ is the same for all temperatures. According to Planck's formula the maximum occurs at the point $\lambda_m T = c'/4{\cdot}9651$. Planck took $\lambda_m T = 0{\cdot}294$, and $\sigma = 5{\cdot}30\times10^{-5}$, giving $C' = 3{\cdot}735\times10^{-5}$, and $c' = 1{\cdot}460$. But if $\lambda_m T = 0{\cdot}289$, and $\sigma = 5{\cdot}72\times10^{-5}$, then $C' = 3{\cdot}708\times10^{-5}$ and $c' = 1{\cdot}435$, according to the latest values of $\lambda_m T$ and $\sigma$. A comparatively small error in $c'$, which is raised to the fourth power, suffices to neutralise the error in $\sigma$. The weak point of the method is that the position of the maximum of an experimental curve cannot be fixed with any certainty when the curve (as in this case) is far from symmetrical on either side of the maximum.

It is too commonly assumed that Planck's radiation formula, in spite of the weighty objections that have been repeatedly urged against it, is so firmly founded in theory and experiment, that no other formula is worth considering in comparison with it. It is also frequently asserted that no formula based on the "classical" mechanics can possibly satisfy the required conditions. The argument is somewhat as follows. The number of possible vibrations per unit volume of a continuous medium possessing the properties of the aether, between the limits $\lambda$ and $\lambda+d\lambda$ of wave-length, should be represented by $8\pi\lambda^{-4}d\lambda$, according to Lord Rayleigh's method of calculation (*Phil. Mag.*, 49, p. 539, 1900), if the length of path between each reflection is restricted to an integral multiple of half a wave-length. If the different frequencies are regarded as separate inconvertible entities, like the molecules of different gases, between which the energy must be equally divided, the whole of the energy would accumulate in the infinitely short waves, which is absurd and contradicts experiment. It would be more natural, however, from a physical standpoint to regard Lord Rayleigh's formula

$$(8\pi RT/N)\lambda^{-4}e^{-c''/\lambda T}\lambda^{-4}d\lambda \quad . \quad . \quad (14)$$

as corresponding to the partition of energy among a number of [illegible] according to Maxwell's law, which is universally [illegible] kinetic theory of gases, as resulting from the steady [illegible] collisions. The steady distribution of energy of [illegible] with matter arises in a similar manner from [illegible] by which the energy of a group of waves is [illegible] the production as the frequency at each encounter [illegible] moving molecule. The frequency, or the reciprocal of the [illegible] corresponds to the energy, and occurs in much the same way in Rayleigh's formula, as the square of the velocity, or the kinetic energy, in Maxwell's law. On this view, Lord Rayleigh's formula evidently represents the distribution of pressure-energy between the different wave-lengths about a mean value RT/N, which, according to the law of equipartition, should be the same as the pressure-energy of a single gas-molecule at the same temperature.

If we take Rayleigh's formula as representing the pressure distribution in full radiation, the expression for the latent heat of absorption L as measured experimentally (corresponding to (4) above, but expressed in terms of the wave-length $\lambda$ in the normal spectrum) may be written

$$L_\lambda d\lambda = C''(T+c''/\lambda)\lambda^{-5}e^{-c''/\lambda T}d\lambda, \quad . \quad . \quad (15).$$

Integrating from 0 to $\infty$ we find $C'' = \sigma c''^5/\pi$. The maximum of this curve occurs at the point where $c''/\lambda T = 2+2\sqrt{2}$, whence $c'' = 4{\cdot}8284\lambda T$. The absolute value of the maximum ordinate comes out $0{\cdot}65734(\sigma T^4/\lambda_m)$. The value of the same ordinate, calculated in the same way for Planck's formula (13), but with $c' = 4{\cdot}9651\lambda_m T$ comes out $0{\cdot}65755(\sigma T^4/\lambda_m)$. It is a curious and significant fact that the maxima should be so exactly the same when the same values of the experimental data are assumed for both curves. The total areas of the two curves are the same, and they agree so closely throughout their whole extent that it would be practically impossible to distinguish between them with certainty by experiments on the distribution of heat in the spectrum. The greatest difference amounts to about 1% of the maximum ordinate, and occurs near the point $\lambda = \lambda_m/2$ on the short wave-length side, where the curve is very steep. This difference becomes quite appreciable in the specific heats, when the curves are differentiated, and seems to lead to better agreement with experiment than Planck's formula as explained above.

The most serious difficulty from an experimental standpoint in applying Planck's formula, is that the latent heat of emission per unit volume is always tacitly assumed (following Planck) to be the same as the energy-density, without taking any account of the pressure, whereas the existence of the radiation pressure is universally admitted as the basis of the deduction of the fourth-power law. The work done by the pressure, if it exists, cannot consistently be neglected in experimental measurements of radiation in steady flow. This is one of the most fundamental points in practical thermodynamics, but had not up to 1921 received sufficient attention from the mathematicians who had worked so elaborately on the theory.

## Vaporization

A good deal of attention has been devoted in recent years to the study of the properties of vapours employed in heat engines and refrigerating machines. The importance of the thermodynamical aspect of the problem has been widely recognized by engineers as the only sure guide to improvements in efficiency, and it has been realized that equations employed to represent the properties of the working fluid must be exactly consistent with the laws of thermodynamics, if it is desired to avoid discrepancies in the results of calculations by different methods. The principal properties of vapours were discussed from this point of view in the earlier article (*see* 27.807). The theory there given still holds good, but it will be of interest to discuss some of the evidence which has since accumulated on the experimental side. The case of steam, for which the experimental data are more accurate than for any other substance, will be taken, as being far the most important to engineers, and as illustrating the properties of vapours at moderate pressures. At high pressures, on the other hand, in the neighbourhood of the critical point, the data for steam are almost entire deficient, owing to the difficulty of the experiments, and the impracticability of using steam as a working fluid under these conditions. In the critical region the properties of carbonic acid have been most widely studied on account of its use for refrigeration.

*Properties of Steam.*—The equations for steam, first proposed by Callendar in the 10th ed. of the *E.B.* (1902), were founded on experimental measurements (1) of the specific heats, $s$ and $S$, of water and steam by the continuous electric method, (2) of the Joule-Thomson cooling-effect C with a differential throttling calorimeter, and (3) on the adiabatic index $\gamma$ for dry steam with a very sensitive platinum thermometer. These experiments, when taken in conjunction with the laws of thermodynamics, sufficed to determine all the required properties with a fair degree of accuracy at moderate pressures.

The experiments on the specific heat of water extended from 0° to 100°C., and, when taken in conjunction with those of Regnault at higher temperatures, showed that the total heat $h$ under saturation pressure could be represented, with sufficient accuracy for the purpose, by the thermodynamic formula

$$h = a+bT+cT(\log T)+dT^2+eT^3/(V-\sigma), \quad . \quad . \quad (16)$$

years, but continually gave rise to minor difficulties and complications when applied to the turbine. In the article cited, and as repeated in the 11th ed. (see § 6, 8, 11), the total heat was defined as the thermodynamic function $E+PV$, and was denoted by the special symbol $F$ in order to distinguish it from Regnault's total heat $H_1$ representing the quantity of heat added to the fluid under the condition of constant pressure equal to that of vaporization. By general convention, the symbol $H$ has now been defined as representing $E+PV$, a property of the substance depending only on the state, and the symbol $Q$ has been allocated to any quantity of heat added under special conditions.

*Equations of Steady Flow.*—These depend on the law of conservation of mass, and on the law of conservation of energy, of which they afford some of the simplest possible illustrations. If a fluid is flowing steadily at a constant rate $M$ (mass per second) through a circuit (pipe or nozzle) of variable cross-section $X$, at a point where the mean volume is $V$ per unit mass, and the mean velocity $U$ units of length per second, we have $MV=kUX$, where the constant $k$ is unity in any consistent system of units, *e.g.* if $U$, $X$, and $V$ are measured in ft., sq. ft. and cub. ft. respectively. It is common practice, however, to measure $X$ in sq. in., which must be reduced to sq. ft. by putting $k=1/144$; and similarly for other arbitrary systems. If we consider any two points (1 and 2) of a circuit for which $M$ and $X$ are known, the relation $MV=kUX$ makes it possible to determine either $U$ or $V$ at each point if the other is known. A second relation is obtained from the conservation of energy. Suppose for example that the points 1 and 2 represent the admission and exhaust of a turbine. When the flow is steady, for each unit mass entering at 1, unit mass must leave at 2. Unit mass entering at 1 carries with it its intrinsic energy $E_1$ and its kinetic energy $U_1^2/2g$, in addition to which work $P_1V_1$ is done by the pressure $P_1$ in forcing the volume $V_1$ into the turbine. Reducing these to heat units by the appropriate numerical factors, $a$ and $J$, we have for the total energy entering the turbine with each unit mass of fluid, $E_1+aP_1V_1+U_1^2/2Jg=H_1+U_1^2/2Jg$, where $H_1$ is the initial value of the total heat, which is always tabulated in heat units per unit mass. Similarly the total energy carried out per unit mass at 2 is $H_2+U_2^2/2Jg$. Since the total quantity of energy existing in the turbine remains constant when the conditions are steady, the excess of the energy carried in over that carried out must be equal to the external work $W/J$ done by the turbine together with the external heat-loss $Q_2$, both expressed in thermal units per unit mass passing through the turbine. We thus obtain the general equation representing the conservation of energy,

$$\text{Heat-Drop, } H_1-H_2=W/J+Q_2+(U_2^2-U_1^2)/2Jg. \quad . \quad . \quad (10).$$

The reduction factors, $a$, $J$, $g$, can be omitted for absolute or C.G.S. units, but it is better to retain them explicitly, because the various quantities can seldom or never be measured in absolute units in practical work, and the retention of the symbols saves much trouble and many mistakes.

In this equation, as applied to a turbine, the term $W/J$, representing the external work, is the most important on the right-hand side. The external heat-loss $Q_2$, and the leaving-loss, depending on the kinetic energy wasted in the exhaust, can be reduced to small corrections, which are readily applied. The external work is the equivalent of the corrected heat-drop, which can be calculated if the initial and final states of the steam are known. The equation takes exact account of any work wasted in internal friction, which does not appear explicitly in the equation because it affects both sides equally. The same equation can be applied to a reciprocating engine, or to any appliance admitting of steady flow.

Joule and Thomson (*Phil. Trans.*, 1854, 321; *Proc. R. S.*, 1856) were the first to employ the function $E+PV$ in their experiments on the flow through a porous plug or orifice. They discussed the various terms in the equation with great precision, but did not apply it to a steam engine, which was first done by Hirn and Rankine, though the equation is commonly attributed to Zeuner. In an ideal throttling experiment, such as that designed by Joule and Thomson, the equation shows that the total heat remains constant, $H_1=H_2$, provided that $U_1=U_2$ and that $W$ and $Q$ are negligible. The lines of constant total heat in the PT diagram can be determined by observing the initial and final values of $P$ and $T$ in a sufficient number of throttling experiments. It is then possible to deduce the actual values of $H$ under any conditions by measuring the specific heat and latent heat at any one pressure, preferably the highest for most fluids.

In applying this equation to the steam turbine Joule and Thomson showed that the kinetic energy of the issue was equivalent to the drop of $E+PV$, or $H$, which follows immediately from equation (10) if $W$ and $Q$ are negligible. In the ideal case, starting from rest, $U_1$ is negligible as compared with $U_2$, so that $U_2^2/2Jg$ is given by the adiabatic heat-drop. [illegible] For given conditions, $V_2$ is known in terms of $P_2$, and $P_2$, so that the discharge $M/X$ per unit area can be deduced by applying the relation $M/X=kU/V$. Joule and Thomson showed that the discharge would reach a maximum in the case of air under adiabatic conditions when the final pressure after passing the throat was 0·53 of the initial pressure, a result which had previously been deduced in a similar way by de St. Venant and Wantzel (*Comptes Rendus*, 1839) from Poisson's equation for the adiabatic, namely $PV^{\gamma}=$ constant. They also showed that the velocity of the discharge under this condition was simply related to the velocity of sound in the air at the original temperature and pressure, but they failed to interpret the relation. Osborne Reynolds (*Phil. Trans.*, 1886, p. 734), using the same equations for a perfect gas, showed that the velocity in the throat or minimum area of the stream was the same as that of sound in the gas under the same conditions, so that when this velocity was reached no further lowering of pressure beyond the throat could possibly increase the discharge. The same result is easily shown to apply to any fluid, either liquid or gas, in the absence of friction. The condition that $M$ is to be a maximum for a given value of $X$ gives $\delta(M/X)=0$, whence $\delta U/\delta V=U/V$. Eliminating $\delta U/\delta V$ by differentiating (11), we obtain, for isentropic flow ($\Phi$ const.)

$$U^2=-J_{\Phi}V(\delta H/\delta V)_{\Phi}=aJ_{\Phi}V^2(\delta P/\delta V)_{\Phi}, \quad . \quad . \quad (12)$$

which is the expression for the velocity of sound. This equation also gives the maximum discharge by substituting $M/X$ for $kU/V$.

In steady-flow calorimetry the drop of H between given initial and final states can be deduced from equation (10) by observing the quantity of heat $Q_2$ which must be abstracted, under conditions such that $W$ and $U^2$ are negligible. The pressure is usually constant, but if there is a large drop of pressure between the initial and final states, as in Regnault's experiments on the total heat of water, the difficulty is avoided, without changing $H_2$, by using a throttle, which is precisely what Regnault did, though he was unable, owing to the defective state of thermodynamics at the time (1847), to appreciate the exact effect of this proceeding. The same method can be applied for measuring the total heat of steam in any state, including the latent heat. In all cases of steady flow the quantity measured is the change of total heat, which is the most important property to determine for steam engines or refrigerating machines working on any modifications of the Rankine cycle. On the other hand the intrinsic energy $E$ is the property required for the constant volume cycle of the internal-combustion type.

A very simple and instructive illustration of the equation of steady flow is that of the temperature gradient in a fluid under gravity. If a current of air is flowing steadily upwards at a moderate speed, the external heat-loss $Q_2$ and the change of kinetic energy are negligible, and the drop of total heat is equivalent to the work done against gravity, giving $W/J=1$ calorie C. for each 1,400 ft. of ascent. This would evidently be the same for any fluid whatever. In the case of dry air the specific heat is nearly independent of the temperature and pressure, and the change of $H$ is equal to $S(t_1-t_2)$, where $S=0\cdot241$ is the specific heat at constant pressure. The drop of temperature will therefore be $1/0\cdot241=4\cdot15$°C. in 1,400 ft.; or the temperature gradient, 0·296°C. per 100 ft., which, however, is evidently quite independent of the initial temperature or pressure, or height, so long as we can afford to neglect the small variations of $S$ and $g$. In an ascending column of *damp* air, condensation sets in with formation of cloud as soon as the temperature falls below the dew point. The drop of $H$ remains 1 calorie per 1,400 ft., but the temperature gradient is greatly reduced by the liberation of the latent heat of the vapour. On the other hand, in a descending current, as in the ventilating shaft of a mine, the temperature increases with depth at the rate of nearly 3°C. per 1,000 ft., which, however, is usually much less than the natural gradient of underground temperature (due to outflow of heat through the earth's crust), which sometimes exceeds 10°C. in 1,000 ft. In this case there will be no condensation, but the air may be cooled by evaporation, if the mine is kept wet to reduce dust, as is usually the case.

According to equation (10) the rate of increase of temperature with depth, denoted by $dt/dz$, is equal to $g/JS$, and is independent of adiabatic flow if $S$ is constant. The *pressure* gradient, $dp/dz$, in gravitational units, is equal to the density $1/v$, or $g/JSt$. If $R$ is expressed, like $S$, in calories per 1°C. Dividing by $dt/dz$, we have $dp/dt=Sp/RT$, giving the adiabatic equation, which is commonly assumed as the starting-point to find the temperature gradient. But the reverse order is more instructive as showing why the temperature gradient differs in [illegible]

*Properties of Radiation.*—The flow of heat by radiation from one body to another at a lower temperature is the commonest case of *steady flow*. Owing to the high velocity of radiation and the absence of thermal capacity in the circuit, the steady state is established in a small fraction of a second, if the temperatures of source and sink are constant. The quantity measured in a radiating experiment is [illegible] the energy $E$ of the radiation, as is frequently assumed, but [illegible] the flow of heat $H$ [illegible] the case of radiation, as in [illegible] the [illegible] the [illegible] the

or lost externally. If the laws of thermodynamics are summarized in the form,

$$dQ = Td\phi = dH - aVdP \quad . \quad . \quad (25)$$

in which $dQ$ represents heat supplied per unit mass by friction or otherwise, we observe that, in the case of isentropic flow, for which $d\phi = 0$, the change of $H$ is equal to the integral of $aVdP$ along the adiabatic, which is readily obtained by substituting for V in terms of H and P from (22) or (17), for any given initial state and final pressure. We may also obtain the general expression for $\phi$ from those for H and V by integrating $d\phi = dH/T - (aV/T)dP$. These expressions may be put in a variety of forms according to the purpose for which they are required. One of the most useful for dry steam is,

$$DH_\phi = (H' - H'')_\phi = (H' - B - ab'P')(1 - T''/T') + ab'(P' - P'') \ldots (27)$$

in which H', P', T', and H'', P'', T'', represent the initial and final states. An exact expression for the adiabatic heatdrop $DH_\phi$ in the case of wet saturated steam, is readily obtained in terms of H' and T', T''. But in practice it is usually more convenient to tabulate H and $\phi$, and the Gibbs' function $G = T\phi - H$, which has the advantage of being a simple function of the temperature only, and is independent of the wetness for a mixture of water and steam in any proportions. From the definition of G, if $\phi$ is constant and equal to its initial value $\phi''$, we obtain immediately the convenient expressions,

$$DH_\phi = (T' - T'')\phi' - G' + G'' = H' - H''_s + T''(\phi_s'' - \phi'), \quad . \quad . \quad (28).$$

The first expression is general, and is readily applied if G' and G'' are tabulated. The second is obtained by substituting for G' and G'' in terms of H and $\phi$, but is applicable only if the final state is saturated, so that $H''_s$ and $\phi''_s$ are the tabulated values for dry saturated steam.

*Effects of Supersaturation.*—For the general theory of the behaviour of a vapour when cooled below the saturation temperature without condensation *see* 27.898–9. The state of supersaturation is very common, in rapid expansion, and has proved to be of some practical importance, as affecting the discharge through a nozzle, and the efficiency of a turbine. It appears that steam usually follows the dry adiabatic, $P/T^{1\frac{1}{13}} = \text{constant}$, for some distance below the saturation point. The drop of temperature is about three times as rapid as along the wet adiabatic, and the volume is smaller than that of saturated steam at the same P and H. The heatdrop, and the velocity generated, are also smaller, for a given pressure drop, than in the case of steam which is assumed to remain in the equilibrium state of saturation throughout the expansion. If the initial steam is dry saturated, it usually remains dry for some distance beyond the throat of a nozzle, so that the discharge, as given by equation (22), is obtained from the dry adiabatic, by substituting $(dP/dV)_\phi = 1{\cdot}3P/V$ at the throat, which leads to values about 5% larger than those given by the equations for wet steam. This is confirmed by experiment, and is represented by the numerical formula for the discharge $M/X_1$ in lb. per second per sq. in. of throat, when P' is in lb./sq. in. and V' in cub. ft./lb. in the initial state,

$$M/X_1 = 0{\cdot}3155(P'/V')^{\frac{1}{2}}, \quad P_1/P' = 0{\cdot}545, \quad . \quad . \quad . \quad (29)$$

in which the small quantity $b$ is neglected as being usually beyond the limits of possible accuracy of measurement.

The defect of heatdrop on reaching the throat is about 5%. If the steam continued to follow the dry adiabatic to low pressures, the defect of heatdrop would often reach 20%, which would be very serious. But soon after passing the throat, the coaggregated molecules begin to act as condensation nuclei, according to Kelvin's equation (*see* 27.899). When this limit is reached, the condensation takes the form of a very thick fog of exceedingly fine particles, and is extremely rapid, owing to the enormous number of nuclei available, about $10^{16}$ per lb. of steam. If the expansion is relatively slow, the steam is transformed into the saturated state, and remains nearly saturated for the rest of the expansion. But if the expansion is very rapid, as in an expanding nozzle at a velocity of 3 or 4000 ft./sec., the steam will remain near the supersaturation limit with a loss of heatdrop amounting to nearly 8% at low pressures, involving a corresponding loss of efficiency. According to Wilson's experiments at low pressures (*see* 27.899), the supersaturation limit is reached when the pressure is about 8 times the normal saturation pressure corresponding to the actual temperature of the steam. The equivalent wetness of the steam at this point, when transformed to the saturated state at the same P and H, would be about 3%. This appears to be confirmed by turbine tests at these pressures, but Wilson's experiments do not afford any direct evidence with regard to the limit at which condensation starts at higher pressures. It appears on theoretical grounds that the pressure ratio corresponding to the supersaturation limit should not be so high as 8 at high pressures, which would require an excessive increase in the drop of temperature, and in the equivalent wetness of the steam at high pressures.

There is some evidence that the equivalent wetness at the supersaturation limit is [illegible] nearly 3% at high as at low pressures. This would [illegible] very simple method of calculation, but more experimental [illegible] to decide the point. The effect of initial supersaturation [illegible] the efficiency of a turbine cannot be satisfactorily [illegible] the older theory that the steam is in the equilibrium state of saturation throughout the expansion, but is a necessary consequence of the phenomenon of supersaturation. The loss due to supersaturation may be entirely eliminated if the superheat is sufficient to prevent supersaturation. In any case the loss will be greatly reduced by superheat, and the results of calculation appear to indicate that the improvement of efficiency may be exactly accounted for in this way. This point has been very fully discussed by H. M. Martin, in "A New Theory of the Steam Turbine" (*Engineering*, vol. 106, 1918); and also by Callendar, *Properties of Steam*, pp. 305–12.

*Properties of Carbonic Acid.*—The critical point of $CO_2$, commonly known as carbonic acid, being at a temperature a little above 31°C., the most convenient point of the scale for accurate regulation, offers special facilities for investigating the critical phenomena. These were first elucidated by T. Andrews (*Phil. Trans.*, 1869), whose investigations formed the starting point for the theories of J. Thomson, J. D. Van der Waals, J. C. Maxwell and R. Clausius. The method employed by Andrews in measuring the volume and pressure of the liquid and vapour at various temperatures reached the highest point of refinement in the researches of E. H. Amagat (*Ann. Chim. Phys.*, 29, p. 136, 1893), whose tables of the properties of $CO_2$ from 0° to 250°C. have generally been accepted as the standard. For practical use in refrigeration the properties are also required at temperatures down to −50°C. The saturation pressures below 0°C. have since been determined by Kuenen and Robson (*Phil. Mag.*, 3, p. 154, 1902), using platinum thermometers. They also determined the vapour pressures of the solid, which follow a curve cutting that of the liquid at a sharp angle at the melting point, which is at −56·2°C., where the common vapour pressure is 5·2 atmospheres. It is found that the vapour pressures of the liquid can be represented with a fair degree of accuracy, sufficient for most practical purposes, by the simple empirical formula,

$$\log p = 1{\cdot}5363 + 3{\cdot}1571/T, \text{ (atmospheres)} \quad . \quad . \quad (30)$$

from −50°C. to the critical point, but (30) gives results which are probably about 2% too high at −50°C. The values of the latent heat above 0°C. can be deduced from Amagat's tables of $p$, V, and $v$, by means of Clapeyron's equation. They are most important below 0°C. for refrigeration purposes, and have since been directly measured by C. F. Jenkin and D. R. Pye (*Phil. Trans.*, A, 213, p. 67, 1914), who also determined the variation of the total heats, H and $h$, of the liquid and vapour, by experiments on the specific heat S, and the cooling-effect C, over the range −30° to +30°. Their observations of the latent heat are well represented by a formula of the Thiesen type,

$$\log L = 1{\cdot}1463 + 0{\cdot}4018 \log (31{\cdot}3 - t), \quad . \quad . \quad (31)$$

and those of the total heat of the liquid under saturation pressure by a formula of the same type as that employed in the case of water, namely

$$h - aVT dp/dt = H - aVT dp/dt = 0{\cdot}42t - 6{\cdot}53, \quad . \quad . \quad (32)$$

in which the constant 0·42 represents the limiting value of the specific heat of the liquid at low pressures, and the constant 6·53 the value of the term $aVT dp/dt$ at 0°C., from which both H and $h$ are supposed to be reckoned. It is quite possible that the specific heat of the liquid at zero pressure may vary in the same way as that of the vapour with temperature, giving a constant value for $S_0 - s_0$, in place of a constant value for $s_0$. This would simplify the equation of saturation pressure, but the observations so far made do not extend over a sufficient range to decide the point. The advantage of these formulae for the total heat is that they fit most simply with Clapeyron's equation, and give a natural approach to the critical point, where both $dh/dt$ and $dH/dT$ become infinite, but with opposite signs.

*Equations for the Volume.*—The equation first proposed for $CO_2$ was that of W. J. M. Rankine (*Phil. Trans.*, 1854, p. 337), representing Regnault's experiments on the deviations from the laws of gases at moderate pressures. Rankine's equation may be put in the convenient form,

$$aP/RT = 1/V - c/V^2 \quad . \quad . \quad . \quad (33).$$

The symbol $a$ represents the usual factor for reducing PV to calories. The value of R in cals./deg. is 0·0451 for $CO_2$. The coaggregation volume $c$ was found by Rankine to vary as $1/T^2$, with a value 3·53 c.c./gm. at 0°C. This equation also represented the observations of Joule and Thomson on the cooling-effect at moderate pressures, but it becomes unsatisfactory at high pressures, and fails near the critical point, giving imaginary values of V when P exceeds $RT/4ac$. This difficulty is removed most simply by introducing the covolume $b$ in the first term on the right, thus,

$$aP/RT = 1/(V - b) - c/V^2, \quad . \quad . \quad . \quad (34)$$

which transforms the equation into a cubic of the same type as that subsequently proposed by J. D. Van der Waals in his essay on the *Continuity of the Liquid and Gaseous States* (1878), except that $c$ according to Van der Waals' equation would vary inversely as T (in place of $T^2$) which would not suit the properties of $CO_2$. If the values of $b$ and $c$ in (34) are determined from the condition that the cubic in V must have three equal roots at the critical point, we obtain the relations,

$$RT_c/aP_c = 8V_c/3 = 8b = 64c/27. \quad . \quad . \quad (35)$$

in which the suffix (c) indicates the values of T, p, and V at the critical point. Taking the values, $p_c = 72{\cdot}9$ atmos. $= 1071$ lb./sq.in. at $T_c = 304{\cdot}4°$ we find,

$b = 0{\cdot}0136$ cub.ft./lb. $= 0{\cdot}874$ cc./gm., $V_c = 2{\cdot}92$ c.c./gm.
$c_1 = 0{\cdot}03265$ " " $= 5{\cdot}287$
$C_v = 0{\cdot}0845$ " " $= 4{\cdot}096$

With these values of the constants, equation (34) represents the observations of Jenkin and Pye on H, S, and $C_v$ very satisfactorily, but the theoretical expressions, applying to any equation of the Van der Waals' type, are somewhat complicated and inconvenient for practical use, namely,

$$H = S_0 T + \beta - 3cRT/V + bRT/(V-b), \quad . \quad . \quad (36)$$

$$SC = a[3c - bV^2/(V-b)^2]/[V^2/(V-b)^2 - 2a/V] \quad . \quad . \quad (37)$$

$$S = S_0 + 3cR/V + bR/(V-b) + [R/(V-b) + cR/V^2]SC/a \quad . \quad . \quad (38).$$

It will be observed that the value of the critical volume $V_c$ is too large to reconcile with the observed value 2·25 c.c./gm. given by Amagat. The value of $b$ is also larger than the observed volume of the liquid at −50°C., and the equation does not represent the latent heat or the saturation pressures at all satisfactorily.

*Equation of Saturation Pressure.*—Maxwell was the first to show how the saturation pressure could be calculated at any temperature from the continuous isothermal of James Thomson (*see* 27.898), as represented by Van der Waals' equation. According to Carnot's principle, that no work can be obtained from heat at constant temperature, the integral of $PdV$ along the continuous isothermal represented by the equation (34), must be equal to the external work of vaporization $p(V-v)$ between the limits V and $v$; and the latent heat of vaporization must be equal to the integral of $aT(dP/dT)_v dV$, between the same limits, at constant T. Applying these conditions to Van der Waals' equation, in which $c$ varies as $1/T$, we obtain,

$$ap(V-v)/RT = \log_e(V-b) - \log_e(v-b) + c/V - c/v \quad . \quad . \quad . \quad (39)$$

$$L/RT = \log_e(V-b) - \log_e(v-b), \quad . \quad . \quad . \quad (40).$$

These give the increase of $p$ between 0° and 30°C. only half the observed value, and the calculated value of $p$ at −50°C. is more than twice too large. The calculated value of L at 0°C. is less than half the observed value, showing that Van der Waals' theory required serious modification.

The equation of Clausius (*Phil. Mag.*, 13, p. 132, 1882) for $CO_2$ is still most commonly quoted. He reverted to Rankine's assumption for the variation of $c$, but introduced an additional empirical constant $b''$ in the denominator of the term representing the effect of coaggregation on the density,

$$aP/RT = 1/(V-b') - c/(V+b'')^2, \quad . \quad . \quad . \quad (42).$$

This has the effect of reducing the value of V for any given values of P and T by the constant quantity $b''$, but makes no difference to any of the other properties in terms of P and T. The values of $c$ and $b$ as deduced from $P_c$ and $T_c$ remain unaltered, but $b' = b - b''$. Clausius selected $b''$ to make the volume of the liquid agree with observation at 20°C.; but the slope of the curve is unaltered, and the calculated value of $v$ by (41) is 26% too small at −50°C., whereas by (34) it is 40% too large. The calculated values of $p$ and L at the same point by either equation are 34% too small for $p$, and 37% too large for L, if Maxwell's theorem is employed. But it is unjustifiable to apply Maxwell's theorem to an equation which represents the properties of the liquid so badly, and it may be doubted whether the theorem is strictly applicable to an unstable transformation, such as that required by the James Thomson isothermal. It is always possible to choose the variation of $c$ to fit the saturation pressures, but this is purely empirical, and fails in other respects.

Since the application of Maxwell's theorem is doubtful and difficult in any case, it seems preferable for practical purposes to calculate the saturation pressures, as in the case of steam (*see* 27.902), by combining an equation of the type (32) for the liquid with a suitable expression for $L_v$. This method, as applied by Callendar (*Properties of Steam*, p. 186), seems capable of giving very accurate values of $p$, without upsetting the agreement with H and V, or introducing intolerable complications in the theoretical expressions, such as have frequently been proposed by mathematicians. It may fairly be regarded as confirming the correctness of the principles applied in the case of steam, and the exact definition of formula (32) for the total heat of the liquid, on which the result mainly depends.

*Critical Conditions.*—The critical point is most conveniently defined, especially in the case of transcendental equations, by the conditions,

$$(dP/dV)_T = 0, \text{ and } (d^2P/dV^2)_T = 0, \quad . \quad . \quad (43)$$

which imply that the isothermal elasticity becomes zero of the second order, vanishing without change of sign at the critical point. Applying these conditions to the equation of Dieterici (*Ann. Phys.*, 5, p. 65, 1901),

$$aP(V-b) = RTe^{-a/RTV}, \quad . \quad . \quad . \quad (44)$$

we obtain,

$$V_c = 2b = c/e, \quad RT/p_c = e^2 b = 3{\cdot}695\,V_c,$$

showing that it gives a value of the ratio of the critical pressure to the ideal volume giving better agreement with experiment than that found from Van der Waals' equation in (39). There are, however, many other conditions to be satisfied which limit the possible choice of equations. The general expressions for S and SC, which are as follows:—

$$SC = (dH/dP)_T = -(dH/dV)_T(dP/dV)_T, \quad . \quad . \quad (44)$$

$$S = (dH/dT)_P = (dH/dT)_V + SC(dP/dT)_V, \quad . \quad . \quad (45)$$

show that SC and S become infinite of the second order at the critical point, but that C remains finite and becomes equal to the reciprocal of the pressure coefficient $(dP/dT)_V$ to the second order of small quantities.

Similarly, if we take the Joule-Thomson equation,

$$SC = aT(dV/dT)_P - aV \quad . \quad . \quad . \quad (46)$$

and divide by $S = aT(dV/dT)_P(dP/dT)_V$ we obtain,

$$C_H = (dT/dP)_H = aV/S \quad . \quad . \quad . \quad (47)$$

which shows that the cooling-effect CH at constant H becomes equal to the cooling-effect $C_S$ in adiabatic expansion when $aV/S$ becomes zero of the second order at the critical point. The three cooling-effects $C_H$, $C_S$, and $C_V$ which are the reciprocals of the pressure coefficients, and are most easily measured for any substance, or deduced from any assumed type of characteristic equation, remain finite and become equal, to the second order of small quantities, at the critical point.

Again, if we take the general expression for the latent heat according to Maxwell's theorem, we see that the latent heat is equal to the product of $aT(V-v)$ by the mean value of $(dP/dT)_v$ between V and $v$. Comparing this with Clapeyron's equation, $L = aT(dp/dt)(V-v)$, we observe that $(dP/dT)_v$ must become equal to $(dp/dt)$ to the first order of small quantities, at the critical point, which affords a useful test of any type of equation, because the coefficient $dp/dt$ is readily observed.

These simple conditions, which seem to have been overlooked, are fatal to most of the equations which have been proposed. For instance, the equation of Clausius for $CO_2$ requires $(dP/dT)_V$ to be equal to $7P/T$ at the critical point. But the observations of Amagat show that $dp/dt = 6{\cdot}58/T$ at this point, so that we should expect to find some difficulty in reconciling the equation of Clausius with the saturation pressures, as already indicated. The equation of Dieterici (43) gives a very satisfactory representation of the cooling effect, to which it has often been applied, provided that the quantity $c$ is assumed to vary as $1/T^{3/2}$. But this gives a value only $4P/T$ for the coefficient $(dP/dT)_V$ at the critical point in place of $6{\cdot}58/T$, so that it would be quite impossible to represent the saturation pressures consistently. Most of the equations which have been proposed are modifications of the cubic type of Van der Waals, but are too complicated and empirical to serve as a satisfactory basis for the physical interpretation of the phenomena of the critical state. There is an almost infinite variety of possible types if transcendental functions are introduced. Many of these will be difficult to manipulate, but, in spite of the complexity of the conditions to be satisfied, we need not despair of arriving ultimately, by a process of elimination, at some form which is in reasonable agreement with experiment and at the same time sufficiently simple to be intelligible.

REFERENCES.—In addition to works cited in the earlier articles, the following may be recommended. On the practical side, Sir J. A. Ewing's *Mechanical Production of Cold* and *Thermodynamics for Engineers* (1920); on the theoretical side, H. S. Carslaw, *Fourier's Series and Integrals* and J. H. Jeans, *Dynamical Theory of Gases*. For experimental details it is always necessary to refer to the original papers, but *Physical and Chemical Constants* by G. W. C. Kaye and T. H. Laby (1925) gives a very handy and up-to-date summary of numerical results.

(H. L. C.)

**HEATON, SIR JOHN HENNIKER,** 1st Bart. (1848–1924), English postal reformer, was born at Rochester, in Kent, May 18, 1848, the son of Lt.-Col. Heaton. He was educated at Kensington House grammar school and King's College, London. In 1864 he went to Australia and became a landowner and newspaper proprietor in New South Wales. He returned to England and entered the House of Commons as M.P. for Canterbury in 1885, retaining the seat until 1910. All his energies were devoted to postal reform. He advocated penny postage throughout the British Empire, and lived to see it achieved and extended to the United States. He also promoted cheaper ocean telegraphy and many other postal reforms. He died at Geneva, Sept. 8 1924.

See *Life and Letters of Sir John Henniker Heaton*, Bart., by his daughter, Mrs. Adrian Porter (1926).

**HEDIN, SVEN ANDERS** (1865– ), Swedish geographer and explorer, was born in Stockholm Feb. 19, 1865. He was educated at Stockholm and Upsala universities, and afterwards studied in Germany at Berlin and Halle. In 1885–6 he made a journey through Persia and Mesopotamia, and in 1890 was attached to the special embassy sent by King Oscar of Sweden to the Shah of Persia. The same year he visited Kashgar, under Tungan [illegible] Russian Turkestan, and in 1890–91 made explorations in Tibet, which gave him a place in the first rank of modern

Asiatic explorers. In 1893 he started from Orenburg, on the Ural river, with the intention of crossing the Asiatic continent to Pekin. His journey traversed a large area of unexplored country (*see* 16.992; 26.923). In two other expeditions (1899–1902, 1906–8) he added considerably to our knowledge of the country and thoroughly explored the sources of the Sutlej and Brahmaputra or Tsanpo (*see* 26.925). Many honours were conferred upon him as a result of his discoveries. Besides receiving medals from various geographical societies, he was specially honoured by the King of Sweden, and he was awarded an hon. K.C.I.E. by the Indian Government.

During the World War Sven Hedin was a prominent supporter of the German cause, and his book *With the German Armies in the West* (1915) gives an account of his experiences as a guest of the German army. Among his publications are *Journey Through Persia and Mesopotamia* (1887); *Journey Through Khorasan and Turkestan* (1889); *Through Asia* (1898); *Central Asia and Tibet* (1903); *Adventures in Tibet* (1904); *Scientific Results of a Journey in Central Asia 1899–1902* (6 vols. 1904–7); *Transhimalaya* (1909; vol. iii., 1913); *Overland to India* (1910); *From Pole to Pole* (1911); *Bagdad, Babylon, Ninive* (1917); *Southern Tibet* (1917); *Eine Routenaufnahme durch Ost* (1918–9).

**HEERINGEN, JOSIAS VON** (1850– ), German general, was born March 9 1850 at Kassel. After having been in command of the II. Army Corps at Stettin he was appointed Minister of War in 1909, and retired from this position in 1913, after he had successfully piloted the last great Army bill through the Reichstag. On the outbreak of the World War he was Inspector-General of the Second Army Inspection, but was at once placed in command of the VII. Army, which was then in Lorraine and after Sept. 1914 was on the Aisne. In 1917 he was appointed to the command of the coast defences, and was placed on the retired list in Nov. 1918.

**HEIJERMANS, HERMANN** (1864– ), Dutch writer (*see* 13.212). His recent plays include *Schabels* (1904); *Allerzielen* (1906); *De Groote Vlucht* (1908); *Ahasverus* (1912) and *Eva Bonheur* (1919). *Op Hoop van Zegen* had by 1921 been acted over 500 times. He lived for a few years in Berlin, but returned to Holland in 1912 in order to manage a society of players, and devoted himself to that work.

**HEINEMANN, WILLIAM** (1863–1920), British publisher, was born May 18 1863 at Surbiton and educated at home. He spent his early years in the study of music until, realizing that he could not hope to be in the front rank of musicians, he started a publishing business. Amongst his earliest publications were Whistler's *Gentle Art of Making Enemies* (1890) and *Heinemann's International Library*, edited by Edmund Gosse. In 1897 he opened the series of *Short Histories of the Literatures of the World* with Gilbert Murray's *Ancient Greek Literature*. Heinemann's most conspicuous service to literature probably lies in his introduction to the English reading public of such foreign writers as Maeterlinck, Ibsen, Björnson, Tolstoi, Couperus and Valera. He also published three plays by his own pen—*The First Step* (1895); *Summer Moths* (1898) and *War* (1901). Since 1913 he had been president of the National Booksellers' Society. He died suddenly in London Oct. 5 1920.

**HEJAZ RAILWAY** (*see* 13.218).—The system comprises the Damascus-Medina line (1,320 km.) and a line from Der'a to the coast at Haifa (180 km.).

In 1900 Sultan Abdul Hamid II., urged by his favourite Izzet Pasha, decided to build a railway from Damascus to Medina and Mecca. The ostensible reason was to provide a cheap and easy means for Moslems to perform the prescribed pilgrimage to the holy places of their Faith, but the Sultan also hoped that the line would strengthen his temporal authority. The military aspect of the enterprise was carefully ignored when, in May 1900, the Sultan, as Khalif, invited the Faithful to contribute towards the expenses of building the "Pilgrim Railway," and subscribed £50,000. An *irade* was issued (May 1900) granting 10% of one month's pay of all officials and soldiers of the Ottoman Empire to the Fund, imposing special stamp duties, and appropriating the proceeds of the sale of the skins of animals sacrificed at Moslem ceremonies for the same purpose. In all about £1,000,000 was raised in cash or kind by voluntary subscriptions throughout the Moslem world, the levies on officials and soldiers produced some £250,000 and, up to Sept. 1 1907, £1,600,000 had been spent. After that date the construction of the railway was entirely in Turkish hands.

A High Commission under Marshal Khasim Pasha was appointed to superintend construction; Hajji Mukhtar Bey began the survey, and, after Jan. 1901, the German engineer-in-chief, Meissner Pasha, took active control of the work. At first Austrian and Italian contractors were employed, but Ottoman railway troops were also used, and for the later stages of the line from El 'Ala to Medina only Moslems were allowed to work. In all, some 7,000 soldiers were employed, besides Italian, Montenegrin and Greek labourers, and Syrian Christian muleteers and followers. The cost per mile of construction worked out at about £3,000. Meissner Pasha began to work from Der'a near Mezeirib, the terminus of a French railway from Damascus, for which an offer of £280,000 was refused by its proprietors. A British company which built a few km. of track inland from Haifa was bought out for £46,250.

Running almost due S. from Damascus, the main line enters the Yarmuk basin and skirts the western edge of the Hauran. South of Der'a it takes much the same course as the old Hajj road along the desert plateau about 65 km. E. of the Jordan, ascending gradually to Ma'an, where it turns S.S.E. About 40 km. farther it reaches its highest point (1,280 metres) and begins to descend the steep escarpment of Batn el Ghul and follows the long N.S. depression between the main Arabian watershed and the 'Aweiridh range. After ascending a saddle the line descends into Wadi Hamdh basin, within which it continues to Medina. The Haifa sector runs roughly W. from Der'a down the Yarmuk valley, crosses the Jordan at Jisr el Mujami', turns S. to Beisan, and then N.W. across the plain of Esdraelon.

The chief stations are:—

| | Height in metres (approx.) | Km. from Damascus (approx.) | Section opened Sept. 1 |
|---|---|---|---|
| (1) *Main Line* | | | |
| Damascus | 696 | — | |
| 'Ezra | 589 | 91 | 1903 |
| Der'a | 529 | 123 | |
| Zerqa | 618 | 203 | 1902 |

| (2) *Der'a–Haifa sector* | | | |
| Mezeirib | 462 | 135 | 1901 |
| Semakh | 189 | 197 | 1905 |
| Jisr el Mujami' (Jordan Bridge) | 246 | 208 | |
| Beisan | 121 | 225 | |
| 'Afule | 62 | 248 | 1904 |
| Haifa | 1 | 384 | |

The line is laid in most part on steel sleepers with ballast of broken lava and basalt. Curves being sharp in places—often not more than 125 metres radius—derailments are frequent. Speed nowhere exceeds 40 km. per hr., and in the southern sector, the maximum obtainable with safety is 14½ km. The fuel used in normal times was a mixture of Turkish Eregli and Cardiff coal imported at Haifa, but during the World War this was replaced by wood from the palm groves of Damascus and Medina and the oak forests of El Hishe to which latter the Turks built a short branch line from Qal'at 'Anaze. The water supply at main stations is from elevated tanks fed by steam or windmill pumps, and at certain places, is so highly mineralized as seriously to affect the tubing of locomotives. The main repairing shops are at Qadim station, Damascus, with smaller shops at Der'a, Ma'an and Tebuk. Before the World War three through trains left Damascus weekly, with numerous specials during the pilgrim season, and the journey took 92 days. In 1911, receipts were £T. 214,000 and, in 1912, 48,000 pilgrims were carried.

After the outbreak of the revolt (1916) the railway was repeatedly damaged by organized parties of Arab forces, the most serious attack being that in the spring of 1918 when a long section S. of Ma'an was so completely destroyed as to be beyond repair during the war. Even in peace times the line was constantly subject to raids by Bedouin, who broke telegraph lines, displaced rails and did much damage to stations. As late as March 1921 organized attacks continued and bridges in the northern sector were destroyed. Control of the Hejaz railway enabled the

Turks to hold Medina until Jan. 1919. The prolongation of the line to Mecca was prevented by the opposition of the Harb tribes, which were inspired by the Grand Sherif of Mecca and by the cessation of subscriptions.

See Anver Pasha, *Die Hedschasbahn*, 1906; Angus Hamilton, *The Hejaz Railway in Problems of the Near East*, 1909. (H. W.-C.)

**HELFFERICH, KARL** (1872– ), German financier and politician, was born July 22 1872 at Neustadt-on-the-Havel. In 1901 he was appointed to a professorship of political science in Berlin. In 1906 he went to Constantinople as manager of the Anatolian railway, which was financed by the Deutsche Bank, and in 1908 he returned to Berlin to take up the chairmanship of the directorate of that great bank. In 1913 he was the chief German delegate at the international financial conference held in Paris for the settlement of Balkan financial affairs after the Balkan wars. In 1915 he was appointed Secretary of State for the Imperial Treasury and carried the votes for the second, third and fourth war loans through the Reichstag. His financial policy was based upon the principle of defraying the cost of the war by borrowing rather than by fresh taxation. He counted upon a final German victory and upon imposing very heavy indemnities upon the Allies. He, therefore, became identified with the policy of Hindenburg and Ludendorff, and considered that no sacrifice of men and money was too great if Germany could hold out until the Allied and Associated Powers were sufficiently exhausted to be willing to accept a "German peace." After a period of scepticism regarding the prospects of the U-boat warfare, he became the most vigorous political advocate of the unrestricted submarine campaign, and was one of those who expected it to reduce Great Britain to impotence in six months' time. In June 1916 he exchanged the Treasury for the Imperial Home Office, and, as Secretary of State for that department, acted as vice-chancellor or representative of the head of the Imperial Government. On the assassination of Count Mirbach at Moscow, Helfferich was appointed in June 1918 as his successor in the diplomatic representation of Germany at the headquarters of the Russian Soviet Republic. Owing to the conditions of insecurity which prevailed under the Bolshevik Government, Helfferich was never able to occupy his post. He returned to Berlin in order to conduct the economic and industrial demobilization of Germany after the Armistice. He remained the irreconcilable adversary of the new republican *régime*, and, in particular, directed his denunciations against the democratic Catholic leader, Erzberger, with whom he had a celebrated lawsuit in 1920. In the Reichstag he led the Conservative and monarchist right, known as the *Deutsch-Nationalen*. He was the author of *Deutschlands Volkstand, 1888–1913* (1913) and of *Der Weltkrieg* (three vols., 1919).

**HELIGOLAND BIGHT.**—The naval battle known as that of Heligoland Bight was fought in the Bight on Aug. 28 1914.

The original plan of the British operations included only the forces in the southern part of the North Sea, and took the form of a sweep to be carried out in the Bight by Commodore (T) and his Harwich flotillas, in conjunction with six submarines of Commodore (S), supported by the "Invincible" and "New Zealand" from the Humber and Cruiser Force (C). Three submarines were to be posted off Heligoland to attack any cruisers coming out, and three to the W. to entice enemy destroyers to come out. The Harwich flotillas were to come down from the N. of Heligoland, then turning W. sweep on a 9-mile front towards Terschelling, cutting off any craft patrolling to the W. of Heligoland. The operation was arranged for Aug. 28 and the operation orders went out on Aug. 25. When Admi. Jellicoe heard of it the next day, he proposed to send Vice-Admi. Beatty with the Battle Cruiser Squadron and the 1st Light Cruiser Squadron to cooperate. This was approved about midnight on Aug. 26, but there was no time to send a full draft of the operation orders N. and Vice-Admi. Beatty, when he sailed from Scapa at 7.30 A.M. on Aug. 27, had only a rough outline of the proposed operation and the rendezvous of the Humber battle-cruisers. He was still in the dark as to the positions and intended movements of the submarines. This by itself would not have been a serious handicap, but unfortunately information of Beatty's movements was not sent out to Commodore (S) (Comm. Roger Keyes) and Commodore (T) (Comm. Reginald Tyrwhitt) till 1.16 P.M. on Aug. 27, by which time they had both sailed, and as the message was not signalled to them, they did not know that Beatty was taking part in the operations till they had actually begun.

By Aug. 27 the British forces were all on their way to the Bight, organized as follows:—

*Sweeping Force.*—"Arethusa," l.c., 2 6-in., 6 4-in., 27 knots; "Fearless," l.c., 10 4-in., 26 knots.

3rd Flotilla:—1st Div.: "Lookout" (Comm. A. B. S. Duttton), "Leonidas," "Legion," "Lennox"; 2nd Div.: "Lark" (Comm. R. Rowley Conwy), "Lance," "Lianea," "Landrail"; 3rd Div.: "Laforey" (Comm. G. R. Edwards), "Lawford," "Louis," "Viviard"; 4th Div.: "Laurel" (Comm. F. F. Rose), "Liberty," "Lysander," "Lucetta."

1st Flotilla:—1st Div.: "Acheron" (Comm. Brian Money), "Attack," "Hind," "Archer," and Div.: "Ariel" (Comm. Dashwood Moir), "Lucifer," "Llewellyn"; 3rd Div.: "Ferret" (Comm. G. Mackworth), "Forester," "Druid," "Defender"; 5th Div.: "Goshawk" (Comm. Hon. Herbert Meade), "Lizard," "Lapwing," "Phoenix."

*Submarines.*—Off Heligoland: E 4 (Lt.-Comm. Leir), E 8, E 9. To W. of Heligoland: E 6 (Lt.-Comm. C. P. Talbot), E 7 (Lt.-Comm. Feilmann), E 8, "Lurcher" "Commodore (S), and "Firedrake."

*Supporting Force.*—1st B.C.S. (Vice-Admi. Sir David Beatty):—"Lion" (flag), Capt. Alfred Chatfield, b.c., 8 13·5-in.; "Queen Mary," Capt. W. R. Hall, b.c., 8 13·5-in.; "Princess Royal," Capt. Osmond de B. Brock, b.c., 8 13·5-in.

1st L.C.S. (Comm. W. E. Goodenough):—"Southampton" (flag), Comm. E. Astley-Rushton, l.c., 8 6-in.; "Birmingham," Capt. Arthur A. Duff, l.c., 9 6-in.; "Falmouth," Capt. John D. Edwards, l.c., 8 6-in.; "Liverpool," Capt. Ed. Reeves, 2 6-in., 10 4-in.; "Nottingham," Capt. Chas. B. Miller, l.c., 9 6-in.; "Lowestoft," Capt. T. W. Kennedy, l.c., 9 6-in.

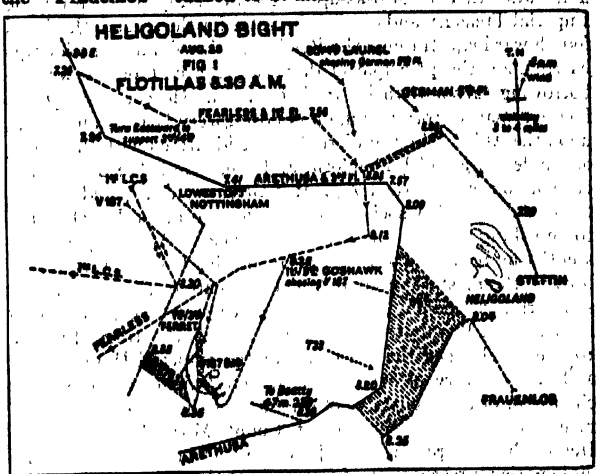
Cruiser Force K (Rear-Admi. Sir Archibald G. Moore):—"Invincible" (flag), Capt. Chas. M. de Bartolome, b.c., 8 12-in.; "New Zealand," Capt. Lionel Halsey, b.c., 8 12-in., attended by 1st Flotilla, 4th Div.: "Badger" (Comm. Chas. Fremantle), "Beaver," "Jackal," "Sandfly."

*In Reserve.*—Cruiser Force K (Rear-Admi. Arthur Christian):—"Eurydice" (flag), Capt. Eustace La T. Leatham; "Bacchante," Rear-Admi. H. H. Campbell, Capt. Hon. Algernon Boyle; "Cressy," Capt. Robert Johnson; "Hogue," Capt. Wilmot S. Nicholson; "Aboukir," Capt. John E. Drummond; all a.c., 2 9·2-in., 12 6-in.; and "Amethyst," Capt. Bertram Thesiger, 12 4-in.

It was light at 4 A.M. Comm. Tyrwhitt had met Comm. Goodenough and the 1st L.C.S. at daybreak, and at first mistook him for the enemy, but his challenge was answered and the cruisers recognized in time to prevent an accident. By 5 A.M. the sun was rising, and the forces were in position some 60 m. N. of Heligoland. The flotillas went off at 20 knots, the "Arethusa" and 3rd flotilla ahead, with the "Fearless" and 1st flotilla 2 m. astern. They were in cruising order, with divisions in line ahead disposed abeam, half a mile apart. Eight m. behind came the 1st L.C.S. with its six light cruisers in three divisions, 2 m. apart. The 1st B.C.S. was some 30 m. to the westward. On reaching a point about 12 m. W. of Heligoland, as he should do about 8 A.M., it was Tyrwhitt's intention to turn W. and sweep down the Bight, while the cruiser squadrons supported his movements.

Let us glance now at the German dispositions. Though their strategical policy was largely based on the idea of the British fleet invading the Bight, the actual attack came as a complete surprise. Posted round Heligoland in a semicircle they had two lines of patrols, an outer line of nine destroyers of the 1st flotilla 25 m. from the fortress, and an inner line of eight vessels of the 3rd Minesweeping Div. 12 m. from it. These were supported by another torpedo flotilla (the 6th) at Heligoland, three cruisers on outpost duty and a battleship in the mouth of the Jade.

Their detailed disposition was as follows:—Outpost Line: 1st Flotilla, G 194, G 196, G 194, V 187, V 188, V 190, V 191, G 195, V 189. Outpost Inner Line: 3rd Minesweeping Div. T 33, T 34, T 39, T 32, T 31, T 36, T 35, T 37 (?), T 38 (?), T 41 (?).



Cruisers in support: "Stuttgart" (22 4·1-in., 23 knots) of the Second Battle Squadron, with Chief of 2nd L. Flotilla; "Frauenlob" (10 4·1-in., 18 knots), of the Jade; "Hela" (4 4·1-in., 18 knots), N. E. of Heligoland. Battleship in support: "Ostfriesland" (12 12-in.), Jade; three battle cruisers in support: "Moltke" in Heligoland Bight, "Von der Tann" and three others in Heligoland Bight, Ushant, Pentland, in Willemshaven Roads:—Cruisers: "Ariadne" (5,600 tons, 10 4·1-in., 19 knots); "Kolberg" (12 4·1-in., 25 knots); Battle

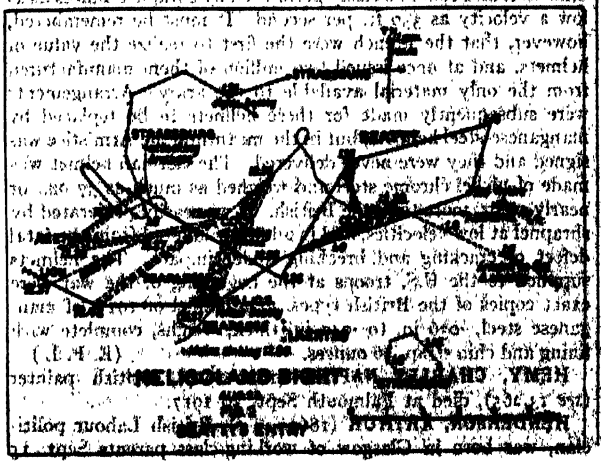
Cruisers: "Seydlitz" (10 11-in., 25½ knots, port engine disabled, under repair); 1st S.G., "Moltke" (10 11-in., 25½ knots); "Von der Tann" (8 11-in., 25½ knots); "Blücher" (12 8·2-in., 23½ knots). Battleships: 1st Squadron, "Ostfriesland," "Oldenburg" and "Thüringen" (relieved "Heligoland" about 8:30 A.M.); 3rd Squadron, "Prinz Reg. Luitpold," "Kaiser," "Kaiserin," "König Albert." In Wilhelmshaven:—"Cöln" (Rear-Adml. Leberecht Maas, Flotilla Admiral; 1909; 4,350 tons, 12 4·1-in., 29½ knots, coaling); "Strassburg" (1912, 4·1-in., 26 knots); "Stralsund" (12 4·1-in., 26 knots); "Rostock" (2nd Leader, Flotillas), 12 4·1-in., 26 knots; "Hamburg" (Chief of 1st U. Flotilla), in dock.
In the Elbe:—2nd Squadron (Deutschlands).
At Brunsbüttel:—"Danzig," "München" (10 4·1-in., 20 knots).
Off the Ems:—"Mainz" (1909, 4,350 tons, 12 4·1-in., 25 knots).

The movements of all the heavy German ships were governed by one dominant consideration—the time of low water on the outer Jade bar. This fell at 9:33 A.M., and though there is not a word of the tide in any operation orders or despatches, it could hardly have occurred more fortunately for the British attack, for it meant that between 7 A.M. and noon no German battle cruiser or battleship could put to sea, a striking instance of the serious handicap imposed on the Germans by their river harbours.

The first signal of anything unusual came in at 5:26 A.M. The British submarine E 7 had fired a torpedo at G 194 about 4:45 A.M. and on the report reaching the "Seydlitz" about 5:26, Rear-Adml. Maas, the German Flotilla Admiral, was ordered to send out the 5th Flotilla to look for the submarine, and they left Heligoland for this purpose at 6:45 A.M. Such was the situation just before the British forces came on the scene. The sea was smooth, with a light wind from N.W., the sky overcast and weather dull. At 6:53 A.M. the "Arethusa" struck the outer patrol line, and, seeing G 194 on the port bow about 3½ m. away, sent her flying towards Heligoland with the 4th Div. of the 1st Flotilla ("Laurel," "Liberty," "Lysander" and "Laertes") in chase. G 196, the next German boat on patrol to the N., sighted the British cruisers and reported them at 7:6, but the report from G 194 did not get through till about 7:30 A.M. V 187, the German flotilla leader's boat, to the S. of G 194, had also sighted two destroyers, possibly the "Lurcher" and "Firedrake," and two cruisers on a S.E. course, and sent in a report of them. The "Laurel's" division drew away to E., and at 7:26 Comm. Tyrwhitt turned to port to support them. The "Fearless," 2 m. astern of him, followed suit. A few minutes later the German 5th Flotilla was sighted coming up from Heligoland, and turned back hotly pursued. Between 7:45 and 8 A.M. it became clear to the German Admiral of Scouting Forces that a considerable force of British destroyers had penetrated the Bight and at 7:47 the "Stettin" and "Frauenlob" were ordered to proceed in support. The "Stettin" had already weighed at 7:32 and by 7:58 was under way, though she had not raised steam in all boilers. Orders were also issued to the "Cöln" and "Strassburg" to support, to the "Kolberg" to get steam up, and to the "Stralsund" to proceed to the Roads. The German 5th Flotilla was being slowly overtaken and was crying for cruiser help (7:45).

The chief of the German 2nd S/M Flotilla, on board the "Stettin," ordered U 25 to take up a position at the N. end of the Heligoland–Weser line; the remainder of the German submarines, U 5, U 16, U 24, U 28, as they became available, were sent towards the Jade to guard the entrance of the river. The alarm had gone in Heligoland and the 8-in. guns were manned at 7:30 A.M.; by 7:50 A.M. the whole fortress was standing to. The pursuit was rapidly approaching the island, and the British flotillas were gradually overhauling the rear destroyers of the German 5th Flotilla. S 24 and V 2 were falling behind; the latter's range had fallen to 3,000 yd., and at 7:50 a 4-in. shot penetrated her stokehold, reducing her speed to 20 knots; another shot got home on the starboard side, damaging the steering connexions, and the British destroyers were gradually drawing closer when the "Stettin" arrived on the scene at 7:58 A.M. and opened fire at 9,200 yards. At 8:5 A.M. the "Fearless" was sighted, and the "Stettin," breaking off the action, retired behind Heligoland to get steam up for full speed, while the "Fearless" turned to W.S.W. at 8:14. This brief respite, however, had enabled the German 5th Flotilla to get clear, and they were now streaming down towards Heligoland, though some of the 3rd Minesweeping Div., which had formed the inner patrol line, were not so fortunate. They came under a heavy fire from the "Arethusa," and D 8 was hit by a 6-in. shot which killed the captain, lieutenant and doctor and disabled a score of men. T 33 too was brought to a standstill, but at 8:8 A.M. the "Frauenlob," which had left the Jade on hearing the guns, suddenly arrived on the scene from the S.; and engaged the "Arethusa" on a S.W. course. The range fell from 6,000 to 4,000 yd., and the "Arethusa," which had only commissioned the previous day, suffered severely. Lt. Eric Westmacott, the signal officer, was killed by the commodore's side. Only the forecastle 6-in. gun remained in action, and one officer and 8 men were killed. The "Frauenlob" did not go unscathed. She received about 10 hits and five dead and 32 wounded. About 8:25 the "Arethusa" turned to W.S.W., and the "Frauenlob" turned to S. and broke off the action.

The approach to Heligoland and the engagements with the "Stettin" and "Frauenlob" may be called the first phase of the action. By 8:30 A.M. it was over and both the flotillas were proceeding to the W., the "Fearless" some 6 m. to the N. of the "Arethusa." Goodenough's light cruisers were about 12 m. to the W. and had also turned W. at 8:30. Beatty's battle cruisers were about 45 m. off to the north-west. The original plan had miscarried. The German patrols, instead of being swept to the W., had broken back and had all reached home with one exception. As the "Fearless" made to the W., she sighted V 187 at 8:15. This was the German flotilla leader's boat, and the 5th Div. of the British 1st Flotilla went off in chase. V 187 ran to the S.W., hoping to make the Jade and Ems, when at 8:45 the "Lowestoft" and "Nottingham," which had been detached by Comm. Goodenough to support the flotillas, suddenly emerged to the N.W. and opened a heavy fire at 4,300 yd., hitting her for the first time. The captain turned to the N. to break past the pursuing destroyers. He had passed them and was about to turn to the E. when the 3rd Div. of the 1st Flotilla came down on him from the north. He was now enveloped in a heavy fire from three sides. One shot put the foremost gun out of action, another penetrated the stokehold, another struck the bridge. The boat was brought to a standstill, and was sunk by the "Goshawk," "Phoenix" and "Ferret" at 9:10 A.M. The "Defender" had lowered boats to rescue the survivors, but the "Stettin," which had now got steam up, sighting V 187's smoke, reappeared on the scene, too late to help her but in time to scatter the destroyers, though she received one or two hits in doing so. The "Defender," in the hurry and scurry, had to leave her boats behind, but E 4 (Lt.-Comm. Leir), after making an unsuccessful attack on the "Stettin," waited till she was out of the way, then suddenly emerged, rescued the "Defender's" men, took an officer and a couple of V 187's men "as a sample," gave the remainder a compass to find their way in Heligoland, then submerged as suddenly as she came.



At 8:55 the "Fearless," making W., had sighted the 4th

thuse," and both flotillas were now 12 to 15 m. W. of Heligoland steering W.S.W. To Commodore (S), who did not know of the presence of Goodenough's cruisers, the situation appeared confused. He had sighted Goodenough's light cruisers at 7:45 and reported them as the enemy, leading Goodenough to look for an enemy where there was none, and now about 9:40 A.M., seeing Goodenough coming up behind him, he reported he was being chased by four enemy cruisers. Tyrwhitt, seeing the signal, turned boldly round at 9:42 A.M. to help him, and proceeded E. again. At 10 A.M., however, the mist lifted for a time and Comm. Keyes recognized Goodenough's cruisers. But he now became concerned for his submarines. The "Southampton" had already attempted to ram E6, and Goodenough, after seeing Keyes, sent a signal to Beatty and withdrew to the W., leaving the field clear for the submarines. The "Arethusa," after proceeding to the E. for 8 m. with the "Fearless" and flotillas, stopped and proceeded to repair damages. A lull of half an hour now ensued in the operations. The "Arethusa" had stopped and Goodenough's cruisers had withdrawn.

By this time the Germans were beginning to appreciate the situation. At 8:20 A.M. the German C.-in-C., Admi. von Ingenohl, had taken over the command from Rear-Admi. Hipper, the Admiral of Scouting Forces, and had ordered the battle cruisers to raise steam and be prepared to go out as soon as the bar would permit. The German light cruisers, eager to attack, had pushed out one by one as soon as they could get up steam. The "Strassburg" had passed the Outer Jade at 9:34 A.M., the "Cöln" (Rear-Admi. Maas) at 10 A.M., the "Ariadne" (ordered out at 10:33) at 10:50, the "Stralsund" at 11:20, the "Kolberg" at noon. They now began to appear on the scene. At 10:40 the "Arethusa" had got under way again, and was making to the W. when the "Strassburg," which had been making strenuous efforts to get in touch with the "Stettin," was sighted to the S.E., coming up on a N.N.W. course. Fire was opened and the flotillas turned to attack, but the "Strassburg," evidently unwilling to close, went off to the N. and disappeared in the mist. At 11:5 the "Cöln" appeared to the S.E., and they turned to engage her, but after a few salvoes she passed on. At 11:16 the "Strassburg" reappeared to the N., and, steering a westerly course, opened a heavy fire at about 8,650 yd. The "Lookout," with the 1st Div. followed by the 2nd Div., went off to attack her at 11:35 A.M. Two of their torpedoes crossed her path, and, driven off by the flotillas, she disappeared in the mist.

The flotillas rejoined the "Arethusa," and continued their course to the westward. When the "Cöln" appeared Tyrwhitt had asked for support, and when the "Strassburg" came in sight the second time, Capt. Blunt, foreseeing a concentration of German light cruisers, sent an urgent signal for assistance.

Beatty meanwhile had been steaming round a position about 54° 28′ N., 6° 20′ E. The situation was obscure to him, but at 10 A.M. he made a general signal to all ships giving his position 54° 56′ N., 6° 14′ E., and adding: "Remaining here," so that they might know where to find him.

The final and decisive phase of the action was now about to begin. Between 11 and 11:20 Beatty received three calls for assistance. At 11:20 he had ordered Goodenough to go to Tyrwhitt's assistance. Then came Capt. Blunt's signal couched in urgent terms, and Beatty decided to take his whole force into the Bight. The "Arethusa," was some 40 m. away, and at 11:22 he formed his battle cruisers in single line ahead, and, working up to full speed, proceeded to E.S.E. to throw his whole force into the issue of the day.

Meanwhile the "Mainz" had left the Ems shortly after 9 A.M. and was making at full speed to the E. to cut off the British destroyers and to get in touch with the "Strassburg" and "Stettin." At 11:20 she was sighted almost right ahead by the 2nd, 3rd and 5th Divs. of the British 1st Flotilla as they came W., with the "Fearless" and "Arethusa" some miles behind them. The "Mainz" turned to the N. and chased the destroyers to the N., bringing them under a heavy fire. But at 11:50 the situation suddenly changed. Out of the mist on the port bow of the 1st Flotilla there appeared four light cruisers steaming S.S.E. at high speed. These were Goodenough's cruisers coming down from the N.N.W. in support. For a few minutes the destroyers were doubtful whether they were friend or foe, then they recognized them as British and turned gleefully to join them. The "Mainz" recognized them too, and, turning sharply round, fled to the southward. The 1st L.C.S. opened fire, but the range was over 7000 yd. and the "Mainz" drew away, reporting that she was being chased by a battle cruiser. The signal was received at 12:5 P.M. and the "Moltke" and "Von der Tann" were ordered to proceed, with the German 8th Flotilla to screen them. At 12:8 P.M. the "Mainz," running S.E., sighted the "Fearless" and 3rd Flotilla. She swung round to S. and the 1st and 2nd Divs. of the British 1st Flotilla turned to N. and the 4th Div. to S. to engage her.

A shot, possibly from the "Fearless," damaged the "Mainz's" rudder and brought her port engine to a stop. She now concentrated on the 4th Division. The "Laurel" was hit by her first salvo; the fourth detonated a number of lyddite shells and blew away the after-funnel, and the "Laurel," with her captain severely wounded, crawled away, hidden by the steam and smoke pouring out of her funnel. The "Liberty" ran into the zone of fire, and had her mast shot away and her captain, Lt.-Comm. Nigel Barthelet, killed. The "Laertes" was hit four times by a single salvo at 4,000 yd. and was stopped dead. But a torpedo fired by the 4th Div. had hit the "Mainz" on the port side amidships. Goodenough's cruisers were closing rapidly and, opening a deadly fire, they reduced her quickly to a wreck. At 12:15 they ceased fire, and at 2.0 the "Mainz" settled by the bows and sank.

The position was still far from clear. The flotillas were scattered. Two German cruisers, the "Strassburg" and "Cöln," had appeared to the N.E. and opened a heavy fire, and the German forces seemed to be concentrating to the northward. But in a few minutes everything was changed. Out of the mist there emerged Beatty's four great battle cruisers steaming at high speed. They swept past the sinking "Mainz," and on to the N.E., Goodenough with his cruisers following in their wake. The German cruisers saw them and fled, but it was too late. At 12:32 the "Cöln" appeared on the port bow, and the "Lion" opened fire at 5,800 yards. The "Cöln" steered desperately to the N.E., but was hit by a heavy shell and her engines disabled. She gained a brief respite, for the "Ariadne" was sighted by the "Lion," trying to cross her bows on a S.E. course in a desperate effort to escape. Her end came quickly. She was hit by the first two salvoes and disappeared in the mist, to the S.E., on fire and sinking. Beatty now decided to withdraw, and at 1:10 P.M. made the signal to retire.

The "Lion" circled round to the N. and sighted the [illegible] again at 1:25 P.M. steering slowly to the S.W. The [illegible] had fallen [illegible] captain was seriously wounded. The "Lion" sent a 13.5 in. shell into her; she keeled over to port and went down, her flag flying, at 1:45. By this time both the "Strassburg" and "Stralsund" had reported the presence of battle cruisers, and

at 1:50 the German light cruisers were ordered to fall back on the "Moltke" and "Von der Tann." At 2 P.M. the German battle cruisers passed the bar of the Outer Jade. The German 1st and 3rd Squadrons were now getting up steam, and the German battle cruisers were ordered not to advance against the British squadron (2:41 P.M.) but to wait for the "Seydlitz" 25 m. W. of Heligoland. By 3:50 the three battle cruisers had reached that position, and had been joined by the "Strassburg," "Kolberg" and "Stralsund." There were no signs of the enemy. The squadron turned back before reaching the position where the "Cöln" went down, and no survivors were found that day. A single stoker was picked up by a torpedo-boat on Aug. 30. Four others had managed to get hold of a battered dinghy, but he alone survived.

For the British it remained only to get home. Adml. Campbell's cruisers met the "Lurcher," with the "Mainz's" crew on board, escorting the "Laurel" and "Liberty," at 4:30 P.M., and the "Laurel" was taken in tow by the "Amethyst." The "Arethusa" struggled on at 6 knots till 7 P.M., then had to signal for assistance, and at 9:30 P.M. was taken in tow by the "Hogue" and reached home safely.

Mist, uncertainty arising from the appearance of British light cruisers, and the speed of the enemy's light cruisers militated against the success of the British submarines. E 7 had begun the day by firing a torpedo at G 194, had sighted the 1st L.C.S. at 10 A.M. and recognized them as British; she had seen the "Danzig" later at 12:40, and at 1:15 had sighted Beatty's battle cruisers, which passed over her—this probably gave rise to the report of an attack on the "Queen Mary." E 4 had fired a torpedo at the "Stettin," picked up the "Defender's" men and seen the "Ariadne" going W. at 12:10 P.M. E 6 had been attacked by the "Southampton" at 9:30, had watched the action between the "Mainz" and the flotillas, and had prepared to attack a four-funnelled cruiser at 1:45, only to recognize it just in time as the "Liverpool."

The German submarines had all been held back off Heligoland by the chief of the 2nd Submarine Flotilla, and the reports of attacks by them on the British were fictitious. When, at noon, it was clear that battle cruisers had entered the Bight, the German submarines were ordered by the chief of the 1st Submarine Flotilla to attack the enemy in the vicinity of Heligoland, but as the enemy was 35 m. off and it would have taken them at least four hours to reach him, the order was ineffective.

The engagement was a severe blow to the German fleet. They had lost three light cruisers and one destroyer, and their casualties were 63 officers and 649 men killed, 20 officers and 361 men wounded, 9 officers and 140 men prisoners, a total of 1,242, against the British 35 killed and some 40 wounded. The Germans had at first expected the British fleet to enter the Bight, but as days passed without a sign of it they became less circumspect and Beatty caught them off their guard. In these circumstances they had only two courses before them—either to keep everything back or send everything out. As it was, the light cruisers had proceeded independently and had fallen victims to greatly superior forces. The exposure of the patrols to sudden attack entailed one of two policies—to keep heavy ships continuously on patrol and tie them to the defence of the rivers, or to lay mine-fields to cover the approaches. The latter policy was adopted and mines began to be laid to the W. of Heligoland in September 1914. The engagement had a further effect, for it confirmed the Kaiser in his determination to limit the German fleet to a strictly defensive policy. When Beatty swooped down on the Bight he drove a great wedge into German naval policy. Von Tirpitz, whose son had been taken prisoner in the "Mainz," wearied him[illegible] plaints, but all in vain. For the British nation and na[illegible] victory came, too, at an opportune time. The irresistib[illegible] of the Ger[illegible] army was being viewed with some-[illegible]may. The [illegible] of a naval victory in the very gates [illegible]ly lightened the gloom and gave the nation faith that [illegible] was equal to its gigantic task. It gave the navy, too, [illegible]fidence in its leaders. They knew that where they were Beatty [illegible] would be. Many a day was to pass before, on another misty day, also in the mouth of another river, Beatty was to look on a very different scene, but the first naval laurels of the war were gained in the Bight, and this naval action ranks as one of the most important of the World War. (A. C. D.)

**HELMET** (*see* 13.247).—The World War again demonstrated the truth of the old saying that "in war it is the unexpected that happens." In view of the developments which had taken place in the science of gunnery, and the destructive effects of modern gun and rifle fire, it would hardly have been anticipated that the world would again witness the spectacle of soldiers in helmets throwing hand grenades and bombs at an enemy only a few yards distant—in fact, a return of the grenadiers in helmets. Against modern rifle-fire, helmets are of no use; and except for ornamental purposes they had long been abandoned. But the World War brought them again into use.

It was not until the war was well advanced, and the armies on the western front had been engaged in trench warfare for some considerable time, that it was realized that a great number of head wounds caused by shrapnel bullets, fragments of shell, etc., travelling at relatively low velocities, might have been prevented by very slight protection. Even then an immense amount of research and experimental work had to be carried out before an efficient helmet was produced, and an immense amount of prejudice had to be overcome before the soldier realized its value and could be induced to wear it. Helmets were first introduced into the French army, and they eventually formed an essential part of the equipment of every soldier.

The problem to be solved in the manufacture of a helmet is very different to that of the ordinary bullet-proof plate which is designed to stop direct rifle-fire. The governing factor is weight, and as it is impossible to attempt to stop direct rifle-fire owing to the excessive weight of metal which this would necessitate, efforts must be confined to securing defence against shrapnel bullets and fragments travelling at low velocities. A hard steel is out of the question, as it would break up under impact. On the other hand a soft steel would be too easily perforated. The properties which the metal must possess are those of extreme toughness and ductility, so that the resistance offered to the impact may be gradual and distributed over as large an area as possible. The effect can perhaps be best described by comparing it with the action of a loosely hung net in stopping a cricket ball or a golf ball. The one material which possesses these requirements to a high degree is manganese steel. This steel can be rolled into thin sheets from which the helmets are pressed, and in this form its ductility is remarkable. The thickness of the metal is only 20 B.W.G. or ·036 of an inch, and this is required to withstand the impact of a shrapnel bullet (forty-one to the pound) travelling at a velocity of 750 ft. per second. Under actual test they resisted this attack at 900 ft. per second.

A comparison of the British helmet with the French and German is of interest. The French helmet weighed slightly less than the British—23½ oz. as against 25½ oz.— but was only made of mild steel and could be easily perforated by shrapnel bullets at as low a velocity as 350 ft. per second. It must be remembered, however, that the French were the first to realize the value of helmets, and at once issued two million of them manufactured from the only material available to the army. Arrangements were subsequently made for these helmets to be replaced by manganese-steel helmets, but in the meantime the Armistice was signed and they were never delivered. The German helmet was made of nickel-chrome steel and weighed as much as 37 oz., or nearly 12 oz. more than the British. It was easily perforated by shrapnel at low velocities, and in addition suffered from the fatal defect of cracking and breaking under impact. The helmets supplied to the U.S. troops at the beginning of the war were exact copies of the British types. The model of 1917, of manganese steel, ·036 in. to ·040 in. thick, weighs, complete with lining and chin strap, 36 ounces. (E. F. L.)

**HEMY, CHARLES NAPIER** (1841–1917), British painter (*see* 13.265), died at Falmouth Sept. 30 1917.

**HENDERSON, ARTHUR** (1863– ), British Labour politician, was born in Glasgow of working-class parents Sept. 15

1863; but his work and interests subsequently lay at Newcastle (where he served an apprenticeship as moulder at Robert Stephenson & Co.'s works), and in the county of Durham. He gradually became prominent in connexion with his own trade union and in the trade-union movement generally. After a while he took a leading part in local affairs, and was for some years a member of the Newcastle city council, and Darlington borough council. He was mayor 1903; and was made a magistrate for the county of Durham. He entered Parliament for Barnard Castle as a Labour member, at a by-election in 1903. When the Labour party were first returned to Parliament in force, in 1906, he soon made his mark as one of their leaders. In 1907 he took a prominent part in advocating the ending, rather than the mending, of the House of Lords; and in 1908 he was elected chairman of the party, a post which he held for two years and to which he was reëlected in the autumn of 1914 when the then chairman, Mr. Ramsay Macdonald, had to resign owing to his pacifist views. As chairman, at the opening of the new session in that autumn, Mr. Henderson promised the full support of organized labour in maintaining the "splendid unity" of the nation.

When Mr. Asquith formed the first Coalition Ministry in 1915, he included Mr. Henderson in the Cabinet as President of the Board of Education, and also adviser of the Government on Labour questions arising out of the World War. Indeed his functions as Labour adviser so occupied his time and attention, that it was thought desirable to relieve him in Aug. 1916 of the Board of Education, and give him the practical sinecure of Paymaster-General, so that he might be free to devote himself to the more congenial part of his work. Throughout the Ministry Mr. Henderson showed himself resolved on a strenuous prosecution of the war. He warmly advocated both the Munitions bill and the Registration bill, and had no hesitation in taking the further step of compulsory service, asserting, on the first Military Service bill, that the choice was between compulsion and defeat, and on the second bill, that the first had brought in more men than was expected and, therefore, that there was every reason to anticipate the success of the second. He followed up this action by strongly urging the Labour party to rally in Dec. 1916 to Mr. Lloyd George, and by accepting himself the position of an original member of the War Cabinet of four without portfolio. In consequence of his prominence as a labour protagonist of the war, his life was threatened, along with the Prime Minister's, by the conspiracy of a Derby family of anarchists, who were duly convicted, and sentenced to considerable terms of penal servitude, in March 1917.

After the revolution in Russia in the spring of 1917 Mr. Henderson visited that country on behalf of the British Government. He found there, as he subsequently explained, the most confused ideas current as to the aims of the Allies in the war, and deliberate perversions circulated by enemy agents. The then Provisional Government at Petrograd favoured an international Labour and Socialist Conference, which was being promoted by the International Socialist Bureau and was to meet at Stockholm. They pressed Mr. Henderson to use his influence with British Labour to attend this Conference; and he, believing the Conference to be inevitable, came to the conclusion that, provided it were merely consultative, it would be better that British representatives should go, rather than permit Russian representatives to meet German representatives alone. He returned with these ideas to England, and, being still secretary of the Labour party as well as a member of the War Cabinet, used his influence as secretary to promote British Labour participation in the Conference. But though the majority of Labour men were apparently in his favour, public opinion in other classes was strongly against any conference with Germans in the midst of war. The Sailors' and Firemen's Union refused to carry the delegates. Mr. Henderson visited Paris in the company of Mr. Ramsay Macdonald to discuss the situation with Labour over there, but found that neither French, nor Belgian, nor Italian, nor American Labour was disposed to join. Moreover, all Mr. Henderson's Labour colleagues in the Government opposed his views; and on Mr. Lloyd George expressing the surprise of the rest of the War Cabinet at his action and their dissent from his policy he resigned and was succeeded by Mr. George Barnes.

The attitude of Labour internationalism was maintained by Mr. Henderson out of office, and he warmly espoused the Labour policy of the latter part of 1918, to take the Labour men out of the Government and appeal for support on a Labour platform, in conjunction with the pacifist wing of the party. This policy cost Mr. Henderson his seat in Parliament at the General Election of Dec. 1918. He was defeated by a candidate of the National Democratic party in East Ham, and none of the Pacifist Labour men with whom he had made common cause found their way into Parliament. He himself returned to the House of Commons at a by-election for Widnes in Sept. 1919. He strongly promoted the League of Nations in the early part of that year; he attended the International Socialist Conference at Berne; and in Dec. 1920 he paid an informal visit to Ireland in the hope of promoting peace. (G. E. B.)

**HENDERSON, SIR DAVID** (1862–1921), British general, was born on Aug. 11 1862. He served in the Nile Expedition of 1898, and in the defence of Ladysmith and the subsequent advance into the Transvaal 1899–1900. In the later phases of the S. African War he was chief of the Intelligence Department, and on its conclusion he was promoted brevet lieutenant-colonel and received the D.S.O. He afterwards held many staff appointments at home, was promoted colonel in 1905, and became director of military training in 1912. In the meantime he had taken up the study and practice of aviation, and in the following year he was appointed the first director of military aeronautics. On the outbreak of the World War he went to France in command of the Royal Flying Corps, while retaining the position of director at the War Office, and he was promoted major-general for distinguished service within a few weeks. But, finding it impossible to combine the duties, he gave up his command at the front early in 1915, and thenceforward devoted himself to the development and expansion of the military flying service. He was promoted lieutenant-general at the beginning of 1917, and at the end of that year he joined the Air Ministry on its creation, as chief of the general staff; but he resigned this position in the following April. In May 1919 he became director-general of the League of Red Cross Societies. He was created K.C.B. in 1914, and K.C.V.O. in 1919. He died at Geneva Aug. 17 1921.

**HENRY, EDWARD LAMSON** (1841–1919), American painter (*see* 13.299), died at Ellenville, N.Y., May 9 1919.

**HENRY, O.** (1862–1910), American short-story writer, was born at Greensboro, N.C., Sept. 11 1862. His real name was William Sydney Porter, and he came from an old southern family. Until 15 years of age he attended a school directed by his maternal aunt in Greensboro and then entered his uncle's drugstore as a clerk. From early years he was a constant reader, and he secured a wide knowledge of the English classics. He has recorded that his favourite books were Lane's translation of *The Arabian Nights* and Burton's *Anatomy of Melancholy*, and that he was a devoted admirer of Tennyson. The close confinement as drug-clerk impaired his health, and in 1882 he was sent to a friend's ranch in Texas, where he remained two years. In 1884 he went to Austin, Tex., where he lived ten years, first as a book-keeper in a real estate office, then as an employee in the General Land Office and from 1891 as teller in the First National Bank of Austin. In 1894 he purchased Brann's *Iconoclast*, a weekly, which after a short time he renamed *The Rolling Stone*. This paper he converted into a ten-page weekly, he alone furnishing most of the matter and the illustrations. Even as a young boy he had been locally famous for his cartoons. After a year the paper "rolled away," to use his own words, and in 1895 he became a reporter on the Houston *Daily Post*. In 1896 he was charged with having embezzled money while teller in the Austin bank some years before. He fled to Honduras, and thereafter visited several South American countries. In 1897 he returned to Austin and the following year was convicted and sentenced to serve four years in the Ohio penitentiary. Later his innocence seemed to have been established, and it was generally agreed that had he originally stood trial he would have been acquitted. He entered prison

April 25 1898 and was released July 24 1901. It was probably while in prison that he first adopted the pen name of O. Henry. Many of his stories, written there, were mailed to New Orleans and thence redirected to the publishers. In 1902 he settled in New York, and sent forth a constant stream of stories, which became extraordinarily popular. They are characterized by a gorgeousness of imagination, recalling *The Arabian Nights* so familiar to him; but the constant striving for effect and the excessive use of slang led many to see in them a degeneration into "literary vaudeville." He is perhaps at his best when describing the endlessly varied types presented by the mass of humanity in New York City. He died in New York June 5 1910.

His own natural reticence concerning his life gave rise to many myths. His stories were issued under the following titles:—*Cabbages and Kings* (1905); *The Four Million* (1906); *The Trimmed Lamp* (1907); *Heart of the West* (1907); *The Gentle Grafter* (1908); *The Voice of the City* (1908); *Roads of Destiny* (1909); *Options* (1909); *Whirligigs* (1910); *Strictly Business* (1910); *The Two Women* (1910); *Let Me Feel Your Pulse* (1910, his last completed story); *Sixes and Sevens* (1911); *Rolling Stones* (1912) and *Waifs and Strays* (1917).

See C. Alphonso Smith, *O. Henry* (1916).

**HENRY, VICTOR** (1850–1907), French philologist (*see* 13.301), died at Sceaux, near Paris, Feb. 1907.

**HENSCHEL, SIR GEORGE** (1850– ), English musician (*see* 13.302), from 1905–8 taught at the Institute of Musical Art, N.Y. He was knighted in 1914. A Mass in eight parts *a cappella* was first sung in 1916. In 1907 he published *Personal Recollections of Brahms* and 12 years later *Musings and Memories of a Musician*. Henschel's very highly developed sense of interpretation and style made him an ideal concert singer, while he was no less distinguished as accompanist.

**HENSON, HERBERT HENSLEY** (1863– ), English divine, was born in London Nov. 8 1863. As an unattached student at Oxford he graduated with a first class in modern history in 1884, and was elected a fellow of All Souls College. He was ordained in 1887, and after being head of Oxford House at Bethnal Green for a year he was given the living of Barking, Essex. He was incumbent of St. Mary's hospital, Ilford, 1895–1900, canon of Westminster and rector of St. Margaret's 1900–12, and dean of Durham 1912–8, when he was promoted to the bishopric of Hereford in succession to Dr. Percival. He had become B.D. in 1898 and successively hon. D.D. of Glasgow, Durham and Oxford, and was for some time hon. professor of modern history at Durham University. Owing to his pronounced liberal opinions in theology, notably as to the Virgin birth, and to his insistence on the validity of Nonconformist orders, highly objectionable to the Anglo-Catholic school in the Church, his elevation to the bench of bishops aroused much controversy, and a number of the clergy of the diocese united in a public protest. The election, however, went forward in face of opposition, which soon subsided. In 1920, he was translated to the bishopric of Durham.

Amongst his published works may be mentioned *Light and Leaven* (1897); *Cui bono, an open letter to Lord Halifax* (1899); *War-time Sermons* (1915) and *Christian Liberty* (1918).

**HERBERTSON, ANDREW JOHN** (1865–1915), British geographer, was born at Galashiels Oct. 11 1865, and educated at Galashiels Academy and Edinburgh Institution. He served for some time with a firm of surveyors in Edinburgh, but later entered Edinburgh University, where he was engaged in research work under Prof. Tait. He subsequently carried out investigations on hygrometry at the Ben Nevis observatory. In 1894 he was appointed lecturer in Geography at Owens College, Manchester; in 1896 lecturer at the Heriot-Watt College, Edinburgh, and in 1899 assistant to the reader in geography at Oxford. He became reader in geography in 1905 and in 1910 received the title of professor. The same year he was president of the geographical section of the British Association. He edited, with Dr. Buchan, [illegible] on meteorology for *Bartholomew's Physical Atlas* [illegible] with O. J. R. Howarth, a *Survey of the British Empire* [illegible]. His paper on *Climatic Regions of the Globe* attracted much attention, and his numerous text-books on geographical subjects and the leading part he took in the foundation and development of the Geographical Association enabled him to exert a powerful influence on the improvement of the teaching of geography. He died at Chinnor, near Oxford, July 31 1915.

**HERKOMER, SIR HUBERT VON** (1849–1914), British painter (*see* 13.364), died at Budleigh Salterton, Devon, March 31 1914.

**HERMANT, ABEL** (1862– ), French author and dramatist, was born in Paris, Feb. 3 1862. He was educated in Paris, and afterwards entered the literary profession, being in 1902 made president of the Société des Gens de Lettres.

His works include *Monsieur Rabosson* (1884); *Amour de Tête* (1890) and *Le Frisson de Paris* (1895), besides various amusing dialogues, such as *Scènes de la Vie des Cours et des Ambassades, comprenant La Carrière, Le Sceptre et Le Char de l'Etat* (1900). His plays include *La Meute* (1896); *Sylvie, ou la Curieuse d'Amour* (1900); *La Belle Madame Hébert* (1905); *Les Jacobines* (1907) and *La Semaine Folle* (1913). He produced a series of novels, *Mémoires pour servir à l'histoire de la Société*, including *Coeurs privilégés* (1903); *La Confession d'un homme d'aujourd'hui* (1904); *Les Affranchis* (1908); *Histoire d'un Fils de Roi* (1911) and *L'Aube ardente* (1919). He also published various books on the war, including *Heures de guerre de la famille Valadier* (1915) and *Histoires de mon ami Jean* (1917).

**HERRICK, ROBERT** (1868– ), American author, was born in Cambridge, Mass., April 26 1868. He was educated at the Cambridge Latin school and at Harvard University (A.B. 1890). He was appointed instructor in rhetoric at the Massachusetts Institute of Technology in 1890 and three years later accepted a similar position at the university of Chicago. At the latter place, passing through the various stages of promotion, he became professor of English in 1905. His novels and short stories deal with the complicated problems of modern life in realistic fashion. They include *The Man Who Wins* (1895); *Literary Love Letters and Other Stories* (1897); *Love's Dilemmas* (1898); *The Gospel of Freedom* (1898); *The Web of Life* (1900); *The Real World* (1901); *Their Child* (1903); *The Common Lot* (1904); *The Memoirs of an American Citizen* (1905); *The Master of the Inn* (1908); *Together* (1908); *A Life for a Life* (1910); *The Healer* (1911); *One Woman's Life* (1913); *His Great Adventure* (1913); *Clark's Field* (1914); *The World Decision* (1916) and *The Conscript Mother* (1916). He was also the author of *Composition and Rhetoric* (1899, with L. T. Damon). He was made a member of the National Institute of Arts and Letters.

**HERTLING, GEORG,** COUNT VON (1843–1919), German statesman, was born Aug. 31 1843 at Darmstadt. In 1882 he became professor of philosophy in the university of Munich, and during his tenure of this chair he published books on Aristotle (1871) and on Albertus Magnus (1880). From 1875 to 1890, and again from 1893 to 1912, he was a member of the Reichstag, and after 1909 led for a time the Centre (Catholic) party in that Assembly. The Regent of Bavaria made him in 1891 a life member of the Upper House of the Bavarian Diet. In 1912 he was appointed Bavarian Minister-President and Minister for Foreign Affairs. King Ludwig III. elevated him to the rank of Count. He had been urged by the Emperor to accept the Chancellorship when Bethmann Hollweg resigned in July 1917, but declined on the ground that he saw no prospect of being able to work in harmony with the higher military command. When Michaelis was got rid of in Oct. 1917 he yielded to pressure which was put upon him, and, although 74 years of age and in a precarious state of health, assumed the burden of the Chancellorship, which he sustained for the ensuing 12 months. The encroachments of the military authorities, particularly Ludendorff, upon the political conduct of the empire became even more serious during Hertling's Chancellorship than they had been during that of Bethmann Hollweg. Hertling's son, an officer who was attached to him as aide-de-camp, has, in a book possessing both political interest and real literary merit, *Ein Jahr in der Reichskanzlei* (1919), given an account of the difficulties which the Chancellor experienced in his dealings with the Emperor and with Ludendorff. It fell to Hertling's lot, moreover, to endeavour to persuade the reactionary Prussian Chamber and the Prussian Herrenhaus to pass the bill which, in fulfilment of the Emperor's belated proclamations, had been introduced for the equalization of the Prussian franchise. In this he failed, although upon one occasion he had gone so far as to warn the Upper House that the question was one which concerned "the existence of the dynasty."

Indeed, two "Chancellor" crises within four months had done much to undermine the whole system of Imperial and Prussian semi-absolutism, and to shake the confidence of the masses in the possibility of a successful issue of the war. The failure of the spring and summer offensives of 1918 destroyed Hertling's hope that he might eventually be able to negotiate with the Allied and Associated Powers on anything like equal terms. Feeling among the masses and also in large sections of the army was giving cause for great anxiety. The necessity for the introduction of real parliamentary government, against which, in accordance with the conservative principles of a lifetime, he struggled, became paramount. His health too was broken. His resignation was accepted on Sept. 30 1918. He died on Jan. 4 1919 at his country home at Ruhpolding in Upper Bavaria. He left reminiscences which were published in 1919 under the title of *Erinnerungen aus meinem Leben*.

**HERTZOG, JAMES BARRY MUNNIK** (1866– ), Dutch South African politician, was born at Wellington, Cape Colony, in 1866, and was educated at the Victoria College, Stellenbosch, going afterwards to Amsterdam University. Returning to South Africa he settled in the Orange Free State, where he was called to the bar and was appointed a judge in 1895. During the South African War of 1899–1902 Hertzog served as a Boer general, though without conspicuous personal distinction in the field. Nevertheless he emerged from the war as one of the recognized leaders of the Free State Dutch, and took a leading part in the consultations of the Dutch leaders which preceded the Peace of Vereeniging. He resisted the policy of making an end of the war, and held out to the end against the moderate counsels of Transvaal leaders such as Gen. Botha and Gen. Smuts. This difference was smoothed over later, but the memory of it persisted and had a potent influence on the course of South African history. When responsible government was granted to the Orange River Colony in 1907 Hertzog became Attorney-General and Minister for Education with Abraham Fischer as Prime Minister. As Minister of Education he pursued with determination a policy of placing Dutch side by side with English as the medium of education, a policy sound enough in view of the racial circumstances of the country, but demanding the utmost skill and tact in its administration. Hertzog showed none of the gifts of the skilled administrator, and as his methods revealed themselves resentment and suspicion grew among the English-speaking people of the colony and from them spread throughout South Africa. The circumstances of the time were difficult enough in themselves, but the contrast between the methods of the Botha Government in the Transvaal as to education and those of the Fischer Government in the Orange River Colony was for all to see. The complications of Hertzog's administration of the Education Department culminated in the summary dismissal by him of Mr. Fraser, an English-speaking inspector in the service of the Department. Hertzog justified this summary action in Parliament and before his constituents by making public accusations against the *bona fides* of Mr. Fraser, who brought a libel action against him, in which the verdict went heavily against Hertzog. Meanwhile the Union movement grew throughout South Africa. Hertzog was one of the representatives of the Orange River Colony on the National Convention which drafted the Union Act, and took office under Gen. Botha as the first Minister of Justice of the Union of South Africa in 1910. During the meetings of the Convention it had seemed that he was ready to obliterate the racial hatreds of the war, but his conduct as Minister of Justice soon showed that the old spirit of bitterness was still strong in him. He was a thorn in the side of the Botha Ministry, and at the end of 1912 the differences between him and his more moderate colleagues in the Cabinet became so plain that the patience of the Prime Minister could ignore them no longer. In Dec. 1912 Gen. Botha resigned, and taking office again, reconstructed his Ministry, leaving Hertzog out. This was the critical point in a long feud between Hertzog on one side and Botha and Smuts on the other. When the World War broke out, Hertzog, who by then had formed the Nationalist party in the South African Parliament and was in steady opposition to the Botha Ministry, resisted the co-operation of the Prime Minister and Smuts with Great Britain in the war. When, at the end of 1914, some of the Dutch-speaking people went into open rebellion, Hertzog hesitated and attempted to compromise, never bringing himself to utter any straight condemnation of rebellion. This course he and the Nationalists maintained throughout the war, drifting ultimately into a formal claim for a republic in South Africa. In two general elections during 1920, when Gen. Smuts had become Prime Minister after the death of Gen. Botha, Hertzog maintained the Parliamentary strength of the Nationalist party, having refused reunion with the party led by Gen. Smuts on the ground that the claim could not be abandoned.

**HERVIEU, PAUL** (1857–1915), French dramatist and novelist (*see* 13.405), produced his last play, *Le Destin est Maître*, in 1914. He died suddenly in Paris Oct. 25 1915.

See A. Binet, *Portrait psychologique de Paul Hervieu* (1914); H. Burckhardt, *Studien zu Paul Hervieu* (1917).

**HEWLETT, MAURICE HENRY** (1861– ), British man of letters (*see* 13.417). Later novels include *Brazenhead the Great* (1911); *Mrs. Lancelot* (1912); *Bendish* (1913); *A Lover's Tale* (1915); *Love and Lucy* (1916) and *Mainwaring* (1918). In verse he also published *Helen Redeemed and Other Poems* (1913); *The Village Wife's Lament* (1918); *Flowers in the Grass* (1920); as well as various translations and imitations of the Norwegian sagas, notably *Thorgils of Treadholt* (1917). His son, Flight-Comm. FRANCIS ESMÉ THEODORE HEWLETT (b. 1891), gained distinction in the R.N.A.S. during the World War, being one of the small force which set out to reconnoitre and photograph Cuxhaven on Christmas Day 1914. His seaplane was forced to descend, and he was picked up only after a week of buffeting with the sea. Throughout 1917 he was with the flying squadrons at Dunkirk, taking daily flights in all weathers to and from Dover. During 1918 he was at Mudros and thence made a flight to bomb Constantinople.

**HEYSE, PAUL JOHANN LUDWIG** (1830–1914), German novelist, dramatist and poet (*see* 13.438), received the Nobel prize for literature in 1910. His later works include *Novellen vom Garda See* (1902); *Gegen den Strom* (1907); *Hallomihles Leben* (1909); *Italienische Volksmärchen* (1914) and *Letzte Novellen* (1914). He died at Munich April 2 1914.

Several volumes of his letters have appeared (1916, 1917, 1919); see also H. Raff, *Paul Heyse* (1910).

**HIBBEN, JOHN GRIER** (1861– ), American educator, was born at Peoria, Ill., April 19 1861. He graduated from Princeton University in 1882; was a student at Princeton Theological Seminary from 1883 to 1886; and later studied at Berlin. In 1887 he was ordained a minister in the Presbyterian Church and was a pastor for four years at Chambersburg, Pa. In 1891 he returned to Princeton where he taught logic as an instructor (receiving the degree of Ph.D. in 1893), assistant professor, and from 1907 professor. In 1912 he succeeded Woodrow Wilson as president.

His works include *Inductive Logic* (1896); *The Problems of Philosophy* (1898); *Hegel's Logic* (1902); *Deduction, Logic* (1905); *The Philosophy of the Enlightenment* (1910, contributed to the Epochs mentioned below); *A Defence of Prejudice and Other Essays* (1913) and *The Higher Patriotism* (1915). He edited *Epochs of Philosophy*, a series of twelve volumes written by distinguished scholars of America, Canada and Great Britain.

**HICHENS, ROBERT SMYTHE** (1864– ), English novelist, was born at Speldhurst, Kent, Nov. 14 1864. He was educated at Tunbridge Wells and Clifton College, and then became a student at the Royal College of Music, London, with a view to adopting music as a profession. He was, however, diverted to journalism and later to fiction. During his musical period he published some lyrics and short stories, besides a novel, *The Coastguard's Secret*, at the age of seventeen. But he first attracted serious attention with *The Green Carnation* (1894) and *An Imaginative Man* (1895). He followed these by some novels of London society such as *The Londoners* (1897) and *The Woman with the Fan* (1904); but his principal work in fiction was a series of novels with an Eastern setting, beginning with *The Garden of Allah* (1905), and including *The Call of the Blood* (1906) and *Bella Donna* (1909). He also published certain travel sketches in

*The Holy Land* (1910) and *The Near East* (1913), as well as tales of the supernatural, of which *The Dweller on the Threshold* (1911) is the best example. Of his dramatized novels *Bella Donna*, produced at the St. James's theatre, London, in 1911–2, and *The Garden of Allah*, produced first in New York and (1920) at Drury Lane theatre, London, were the most successful.

**HIGGINSON, HENRY LEE** (1834–1919), American banker, was born in New York City Nov. 18 1834. At the age of 17 he entered Harvard College but before finishing his course entered the banking house of S. & E. Austin, of Boston. He later went to Vienna for a year, where he studied music. On the outbreak of the Civil War he was commissioned second lieutenant of volunteers and was soon promoted to first lieutenant. Later he was made captain and transferred to the volunteer cavalry, being promoted major in 1862 and two years later brevetted lieutenant-colonel. In 1863 he was severely wounded at Aldie, Va., and in the following year was honourably discharged, after serving for a time on the staff of Maj.-Gen. Barlow. In 1868 he joined the banking firm of Lee, Higginson & Co., of Boston, with whom he remained until his death. His interest in music led to his founding the Boston Symphony Orchestra in 1881. A long line of distinguished directors placed this organization in the first rank. It was a stimulating source of musical education in America and won full recognition abroad. In 1891 as a memorial to certain friends who died in the Civil War, he presented Soldiers' Field to Harvard University. In these extensive athletic grounds the Stadium was built. In 1899 he erected the Harvard Union as a general meeting-place for all undergraduates. He was a trustee of numerous institutions, including the New England Conservatory of Music, and was for many years a fellow of Harvard University. He died in Boston, Mass., Nov. 14 1919.

See Bliss Perry, *The Life and Letters of Henry Lee Higginson* (1921).

**HIGGINSON, THOMAS WENTWORTH** (1823–1911), American author (*see* 13.455), died in Cambridge, Mass., May 9 1911.

See *T. W. Higginson: The Story of His Life* (1914), by M. T. Higginson (his wife).

**HILDEBRANDSSON, HUGO HILDEBRAND** (1838– ), Swedish meteorologist, was born at Stockholm Aug. 19 1838, and was educated at the Stockholm gymnasium and the university of Upsala, where he took his doctor's degree in 1858, becoming doctor of physics in 1866. In 1878 he was appointed first professor of meteorology at Upsala and director of the meteorological observatory there, retaining these posts until 1906. He was a prominent member of the International Meteorological Committee, and for some years served as its secretary, while he also sat on the Nobel Committee for Physics, in 1900 obtaining the Nobel prize. In 1880 he was elected an hon. fellow of the Royal Meteorological Society of London, which in 1920 awarded him the Symons gold medal, being also a member of many foreign scientific societies.

As a meteorologist Hildebrandsson is remarkable for his researches into the subject of cloud, and in 1880 was requested by the International Meteorological Committee to prepare the *International Cloud Atlas*, a work carried out in conjunction with Léon Teisserenc de Bort. Many further observations were subsequently incorporated in *Les bases de la météorologie dynamique* (1907), in which Teisserenc de Bort again collaborated. His papers on centres of action of the atmosphere mark a great advance in seasonal forecasts.

**HILL, DAVID JAYNE** (1850– ), American diplomat and publicist, was born at Plainfield, N.J., June 19 1850. After graduating in 1874 from the university of Lewisburg, Pa. (later known as Bucknell University), he taught there first as instructor in Greek and Latin and from 1877 as professor of rhetoric. In 1879 he was elected president of Bucknell and in 1888 of the university of Rochester. In 1896 he resigned and went abroad to study public law. He returned in 1898 on being appointed Assistant Secretary of State by President McKinley. While in Washington he was also professor of European diplomacy in the School of Comparative Jurisprudence and Diplomacy. In 1903 he was appointed ambassador to Switzerland and in 1905 was transferred to Holland, where he remained two years. He was a delegate to the Second Peace Conference at The Hague in 1907. From 1908 to 1911 he was ambassador to Germany, resigning in the latter year. In 1914 he was an unsuccessful candidate for the Republican nomination for the U.S. Senate to succeed Elihu Root. In 1920 he was made a member of the American Academy of Arts and Letters.

His best known work is his *History of Diplomacy in the International Development of Europe*, embracing *A Struggle for Universal Empire* (1905); *The Establishment of Territorial Sovereignty* (1906) and *The Diplomacy of the Age of Absolutism* (1914). His other numerous writings include a *Life of Washington Irving* (1877); a *Life of William Cullen Bryant* (1878); *The Science of Rhetoric* (1878); *The Elements of Psychology* (1886); *The Social Influence of Christianity* (1888); *Principles and Fallacies of Socialism* (1888); *Genetic Philosophy* (1893); *The Conception and Realization of Neutrality* (1902); *World Organization as Affected by the Nature of the Modern State* (1911, being lectures delivered at Columbia University); *The People's Government* (1915); *Americanism—What It Is* (1916); *The Rebuilding of Europe* (1917); *Impressions of the Kaiser* (1918); *Present Problems in Foreign Policy* (1919) and *American World Policies* (1920).

**HILL, JAMES J(EROME)** (1838–1916), American railway capitalist (*see* 13.464), died at St. Paul, Minn., May 29 1916. He resigned the chairmanship of the board of directors of the Great Northern railway in 1912. He had long thought that the farmers and millers of the north-west needed a large financial institution near at hand to which they could easily turn for aid. Accordingly in 1913 he secured control of the First and the Second National Banks of St. Paul and merged them, thereby increasing local facilities for loans. On the outbreak of the World War he was deeply interested in the cause of the Allies, and exerted all his influence in behalf of the Anglo-French loan of 1915. On learning in the same year that friends had raised $125,000 for establishing as a tribute to him a chair of transportation at Harvard he added a like amount. During his latter years he gave much attention to developing the Hill Reference library, in St. Paul, to which he contributed liberally. He was the owner of a remarkable collection of modern French paintings, including fine examples of Puvis de Chavannes, Corot, Delacroix, Millet and others. He was the author of *Highways of Progress* (1910). He left no will, and his estate, when appraised, amounted to less than $60,000,000, only about one-fourth in railroad securities.

**HILL, OCTAVIA** (1838–1912), English philanthropic worker (*see* 13.465), died in London Aug. 13 1912.

**HINDENBURG, PAUL VON** (1847– ), German soldier, chief of the great general staff during the World War, was born on Oct. 2 1847 at Posen. His full family name was von Beneckendorf und Hindenburg. His promotion was slow; from 1877 to 1884 he served on the general staff, but he was 47 years of age when he became colonel, and 49 when he attained a military position of higher importance as chief of the general staff of the VIII. Army Corps. In 1904, when he was 57, he was appointed to the command of the IV. Army Corps, and in 1911 was placed on the retired list, at the instance, it is said, of the Emperor William II. (who had criticized manœuvres of his corps). While in command of this Eastern Corps he had thoroughly studied the strategy, and above all the geography, of a possible war with Russia, a fact which was widely known in the German army, but to which the German Emperor does not appear, at the time, to have attached importance. When, at the outbreak of the World War, East Prussia was overrun by the armies of Rennenkampf, military opinion turned to Hindenburg, and he was recalled from his retirement at Hanover, and appointed to the command of the VIII. Army with Ludendorff as his chief of staff. In Aug. and Sept. he won the victories of Tannenberg and the Masurian Lakes, which were decisive for the deliverance of East Prussia and for the prospects of any Russian advance into Germany, upon which sections of opinion in the Entente countries were reckoning. In the summer of 1915 he planned and executed a German advance against Riga, Dünaburg and Molodetschno. In acknowledgment of his victories he had meanwhile been advanced, on Aug. 27 1914, to the rank of colonel-general (*Generaloberst*), and, on Nov. 27 of the same year, to that of field-marshal. He had further been appointed, in Nov. 1914, chief in command over the armies of the East, a command which was extended at the beginning of Aug. 1916 so as to embrace sections

Indeed, two "Chancellor" crises within four months had done much to undermine the whole system of Imperial and Prussian semi-absolutism, and to shake the confidence of the masses in the possibility of a successful issue of the war. The failure of the spring and summer offensives of 1918 destroyed Hertling's hope that he might eventually be able to negotiate with the Allied and Associated Powers on anything like equal terms. Feeling among the masses and also in large sections of the army was giving cause for great anxiety. The necessity for the introduction of real parliamentary government, against which, in accordance with the conservative principles of a lifetime, he struggled, became paramount. His health too was broken. His resignation was accepted on Sept. 30 1918. He died on Jan. 4 1919 at his country home at Ruhpolding in Upper Bavaria. He left reminiscences which were published in 1919 under the title of *Erinnerungen aus meinem Leben*.

**HERTZOG, JAMES BARRY MUNNIK** (1866– ), Dutch South African politician, was born at Wellington, Cape Colony, in 1866, and was educated at the Victoria College, Stellenbosch, going afterwards to Amsterdam University. Returning to South Africa he settled in the Orange Free State, where he was called to the bar and was appointed a judge in 1895. During the South African War of 1899–1902 Hertzog served as a Boer general, though without conspicuous personal distinction in the field. Nevertheless he emerged from the war as one of the recognized leaders of the Free State Dutch, and took a leading part in the consultations of the Dutch leaders which preceded the Peace of Vereeniging. He resisted the policy of making an end of the war, and held out to the end against the moderate counsels of Transvaal leaders such as Gen. Botha and Gen. Smuts. This difference was smoothed over later, but the memory of it persisted and had a potent influence on the course of South African history. When responsible government was granted to the Orange River Colony in 1907 Hertzog became Attorney-General and Minister for Education with Abraham Fischer as Prime Minister. As Minister of Education he pursued with determination a policy of placing Dutch side by side with English as the medium of education, a policy sound enough in view of the racial circumstances of the country, but demanding the utmost skill and tact in its administration. Hertzog showed none of the gifts of the skilled administrator, and as his methods revealed themselves resentment and suspicion grew among the English-speaking people of the colony and from them spread throughout South Africa. The circumstances of the time were difficult enough in themselves, but the contrast between the methods of the Botha Government in the Transvaal as to education and those of the Fischer Government in the Orange River Colony was for all to see. The complications of Hertzog's administration of the Education Department culminated in the summary dismissal by him of Mr. Fraser, an English-speaking inspector in the service of the Department. Hertzog justified this summary action in Parliament and before his constituents by making public accusations against the *bona fides* of Mr. Fraser, who brought a libel action against him, in which the verdict went heavily against Hertzog. Meanwhile the Union movement grew throughout South Africa. Hertzog was one of the representatives of the Orange River Colony on the National Convention which drafted the Union Act, and took office under Gen. Botha as the first Minister of Justice of the Union of South Africa in 1910. During the meetings of the Convention it had seemed that he was ready to obliterate the racial hatreds of the war, but his conduct as Minister of Justice soon showed that the old spirit of bitterness was still strong in him. He was a thorn in the side of the Botha Ministry, and at the end of 1912 the differences between him and his more moderate colleagues in the Cabinet became so plain that the patience of the Prime Minister could ignore them no longer. In Dec. 1912 Gen. Botha resigned, and taking office again, reconstructed his Ministry, leaving Hertzog out. This was the critical point in a long feud between Hertzog on one side and Botha and Smuts on the other. When the World War broke out, Hertzog, who by then had formed the Nationalist party in the South African Parliament and was in steady opposition to the Botha Ministry, resisted the co-operation of the Prime Minister and Smuts with Great Britain in the war. When, at the end of 1914, some of the Dutch-speaking people went into open rebellion, Hertzog hesitated and attempted to compromise, never bringing himself to utter any straight condemnation of rebellion. This course he and the Nationalists maintained throughout the war, drifting ultimately into a formal claim for a republic in South Africa. In two general elections during 1920, when Gen. Smuts had become Prime Minister after the death of Gen. Botha, Hertzog maintained the Parliamentary strength of the Nationalist party, having refused reunion with the party led by Gen. Smuts on the ground that the claim could not be abandoned.

**HERVIEU, PAUL** (1857–1915), French dramatist and novelist (*see* 13.405), produced his last play, *Le Destin est Maître*, in 1914. He died suddenly in Paris Oct. 25 1915.

See A. Binet, *Portrait psychologique de Paul Hervieu* (1914); H. Burckhardt, *Studien zu Paul Hervieu* (1917).

**HEWLETT, MAURICE HENRY** (1861– ), British man of letters (*see* 13.417). Later novels include *Brazenhead the Great* (1911); *Mrs. Lancelot* (1912); *Bendish* (1913); *A Lover's Tale* (1915); *Love and Lucy* (1916) and *Mainwaring* (1918). In verse he also published *Helen Redeemed and Other Poems* (1913); *The Village Wife's Lament* (1918); *Flowers in the Grass* (1920); as well as various translations and imitations of the Norwegian sagas, notably *Thorgils of Treadholt* (1917). His son, Flight-Comm. FRANCIS ESMÉ THEODORE HEWLETT (b. 1891), gained distinction in the R.N.A.S. during the World War, being one of the small force which set out to reconnoitre and photograph Cuxhaven on Christmas Day 1914. His seaplane was forced to descend, and he was picked up only after a week of buffeting with the sea. Throughout 1917 he was with the flying squadrons at Dunkirk, taking daily flights in all weathers to and from Dover. During 1918 he was at Mudros and thence made a flight to bomb Constantinople.

**HEYSE, PAUL JOHANN LUDWIG** (1830–1914), German novelist, dramatist and poet (*see* 13.438), received the Nobel prize for literature in 1910. His later works include *Novellen vom Garda See* (1902); *Gegen den Strom* (1907); *Hallomihles Leben* (1909); *Italienische Volksmärchen* (1914) and *Letzte Novellen* (1914). He died at Munich April 2 1914.

Several volumes of his letters have appeared (1916, 1917, 1919); see also H. Raff, *Paul Heyse* (1910).

**HIBBEN, JOHN GRIER** (1861– ), American educator, was born at Peoria, Ill., April 19 1861. He graduated from Princeton University in 1882; was a student at Princeton Theological Seminary from 1883 to 1886; and later studied at Berlin. In 1887 he was ordained a minister in the Presbyterian Church and was a pastor for four years at Chambersburg, Pa. In 1891 he returned to Princeton where he taught logic as an instructor (receiving the degree of Ph.D. in 1893), assistant professor, and from 1907 professor. In 1912 he succeeded Woodrow Wilson as president.

His works include *Inductive Logic* (1896); *The Problems of Philosophy* (1898); *Hegel's Logic* (1902); *Deduction, Logic* (1905); *The Philosophy of the Enlightenment* (1910, contributed to the Epochs mentioned below); *A Defence of Prejudice and Other Essays* (1913) and *The Higher Patriotism* (1915). He edited *Epochs of Philosophy*, a series of twelve volumes written by distinguished scholars of America, Canada and Great Britain.

**HICHENS, ROBERT SMYTHE** (1864– ), English novelist, was born at Speldhurst, Kent, Nov. 14 1864. He was educated at Tunbridge Wells and Clifton College, and then became a student at the Royal College of Music, London, with a view to adopting music as a profession. He was, however, diverted to journalism and later to fiction. During his musical period he published some lyrics and short stories, besides a novel, *The Coastguard's Secret*, at the age of seventeen. But he first attracted serious attention with *The Green Carnation* (1894) and *An Imaginative Man* (1895). He followed these by some novels of London society such as *The Londoners* (1897) and *The Woman with the Fan* (1904); but his principal work in fiction was a series of novels with an Eastern setting, beginning with *The Garden of Allah* (1905), and including *The Call of the Blood* (1906) and *Bella Donna* (1909). He also published certain travel sketches in

similar upbringing for the Nonconformist ministry, became prolific writers of widely read novels with a distinct religious note. Among those of Silas Hocking were *Alec Green* (1878); *Who Shall Judge?* (1910); *His Own Accuser* (1917) and *Watchers in the Dawn* (1920). Among those of Joseph Hocking were *Jabez Easterbrook* (1891); *Zillah* (1892); *The Scarlet Woman* (1899); *Tommy and the Maid of Athens* (1917) and *The Pomp of Yesterday* (1918).

**HODGE, JOHN** (1855– ), British Labour politician, was born at Muirkirk, Ayrshire, Oct. 29 1855. He was educated at the Motherwell Ironworks school, and also at the Hutchesontown grammar school, Glasgow, afterwards becoming a metal worker. He was for many years active in the local politics of Glasgow and western Scotland, and formed the British Steel Smelters' Mill, Iron, Tinplate and Kindred Trades Association for the betterment of the workers' conditions, becoming its secretary. He unsuccessfully contested Gower (1900) and Preston (1903) but in 1906 was returned as Labour member for the Gorton division of Lancashire. In the House he spoke frequently on industrial questions, and was an earnest advocate of the establishment of conciliation boards for the prevention of trade disputes. When Mr. Arthur Henderson entered the Coalition Government in 1915, Mr. Hodge became acting chairman of the Labour party, and in 1916 himself entered the Government as Minister for Labour. In 1917 he became Minister of Pensions, but resigned this office in 1919.

**HODGKIN, THOMAS** (1831–1913), British historian (*see* 13.557), died at Falmouth March 2 1913.

**HODGSON, SHADWORTH HOLLOWAY** (1832–1912), English philosopher, was born at Boston, Lincs., Dec. 25 1832. Educated at Rugby and Corpus Christi College, Oxford, he devoted himself from 1858 onwards entirely to the study of philosophy. He helped to found the Aristotelian Society of London in 1880, and was its first president. His published works include *Time and Space* (1870); *The Philosophy of Reflection* (1878) and a complete exposition of his philosophy in *The Metaphysic of Experience* (1898). For an account of his views, *see* 18.251. He died in London June 13 1912.

**HOGARTH, DAVID GEORGE** (1862– ), British classical archaeologist, was born at Barton-on-Humber May 23 1862. Educated at Winchester and Magdalen College, Oxford, he became first Craven travelling fellow in 1886. Together with Sir William Ramsay he made journeys of exploration in Asia Minor between 1887 and 1894. He has conducted numerous excavations, notably Paphos (1888), Dêr-el-Bahari (1894), Naukratis (1899 and 1903), Knossos (1900), Ephesus (1904–5), Assiut (1906–7) and Carchemish (1911). He was director of the British School at Athens from 1897 to 1900, and was appointed keeper of the Ashmolean museum at Oxford in 1909. He is a fellow of the British Academy and a Founder's gold medallist of the Royal Geographical Society (1917). During the World War (as Commander R.N.V.R.) he directed the Arab intelligence bureau at Cairo under the British Admiralty (1915–9), went to Arabia on a special mission in 1916, accompanied the British army to Palestine in 1918, and was British commissioner (Middle East Commission) at the Paris Peace Conference in 1919.

Amongst his publications are *Devia Cypria* (1890); *A Wandering Scholar in the Levant* (1896); *Philip and Alexander of Macedon* (1897); *The Nearer East* (1902); *The Penetration of Arabia* (1904); *Accidents of an Antiquary's Life* (1910); *The Balkans* (1915); *Hittite Seals* (1920) and many archaeological reports.

**HOLBROOKE, JOSEF CHARLES** (1878– ), English musical composer, was born at Croydon July 5 1878, his father being an able pianist, his Scottish mother a professional singer. He spent his early years in travelling around the country with his father and various entertainers. But on his father obtaining an engagement as pianist at Collins's music-hall in Islington, and a little later at the Bedford music-hall, the family settled in London, where Josef became a chorister at St. Ann's, Soho; he also attended the church school. During this period he was taught both the violin and the piano, so that when, in 1893, he entered the Royal Academy of Music he was already well trained as pianist and musician with a good knowledge of the classics. Holbrooke's somewhat fitful career at the R.A.M. was ended in 1896, he having accumulated many medals and prizes and one or two scholarships. On leaving the R.A.M. he became conductor and pianist to a touring company, which was unsuccessful, and he then returned to London and took pupils. A turning point in his career came through the characteristic generosity of Sir (then Mr.) August Manns, who played Holbrooke's symphonic poem, *The Raven*, at a Saturday concert at the Crystal Palace on March 3 1900. From about that time compositions flowed unceasingly from his prolific pen. *Queen Mab* and a Byronic poem appeared in 1904 and 1906; *The Bells* in 1907; *Homage to Poe* in 1908; *Apollo and the Seaman* (symphonic music to Herbert Trench's poem) 1908. The opera of *Children of Don* was given at the London Opera House in 1911; *Dylan* at Drury Lane two years later; *Bronwen* completed, and *The Wizard* produced, during Holbrooke's visit to the United States at Chicago, in 1915. The opera-ballet, *The Enchanted Garden*, dates from 1915. Besides a great mass of music for orchestra Holbrooke wrote concertos for pianoforte ("The Song of Gwyn ap Nudd") and violin, some five quartets, a horn trio, three quintets, four sextets, and dramatic scenes for voice with orchestra.

See George Lowe, *Josef Holbrooke and his Work* (1920).

**HOLDEN, SIR EDWARD HOPKINSON,** 1ST BART. (1848–1919), English banker, was born May 11 1848 at Tottington, Lancs., and spent his early years at the neighbouring village of Summerseat, where he was educated. He entered a business establishment at an early age, but later obtained a junior clerkship in the Manchester and County Bank at a salary of £30 a year. Here he remained for 14 years, and at the end of that time became a bank accountant as a result of answering an advertisement in the *Economist*. During this period he also studied law and political economy at Owens College in company with his wife. In 1881 he went to Birmingham as accountant of the Birmingham and Midland Bank, and here his rise was extraordinarily rapid. In a comparatively short space of time he rose to be general manager, and this led later to his occupying the double position of managing director (1898) and eventually chairman (1908). He devoted himself with great energy and much success to developing the amalgamating policy of his bank, which ultimately developed into the London Joint City and Midland Bank. For the history of the amalgamations leading to that result, *see* BANKS AND BANKING. From about 1898 he interested himself largely in international banking, with the result that he became as great an expert on foreign exchange questions as on home finance. He was the first of the larger London joint-stock bankers to open a foreign exchange department. In 1906 he was elected Liberal member for the Heywood division of Lancs., and in 1909 a baronetcy was conferred upon him. In 1915 he went with Lord Reading to the United States on behalf of the Government and arranged there the Anglo-French loan. He died July 23 1919.

Holden was in many ways a typical "Lancashire lad"; he was always a shrewd business man, with a pugnacious disposition, a firm friend to his friends, a hot fighter against opponents, but with unusual vision and with a remarkable *flair* for banking operations. As chairman of the London City and Midland Bank, which, under him and through his exertions, became the greatest of the English joint-stock institutions, he was for many years the most powerful figure among the clearing bankers, and his interests were bound up with the progressive success of the bank with which he was identified. He was a man of great activity of mind, keen to spot the opportunities and tendencies in contemporary finance, and assiduous in mastering its problems. During the World War he did valuable work in this respect, the extent of which cannot well be over emphasized. His annual addresses to the shareholders of his bank were a succession of educational manifestoes, packed with information and instruction. Before the war he had taken the lead in advocating a larger gold reserve, and himself started the accumulation of a larger independent gold-holding by his bank. In this and various other ways he was a pioneer in a number of improvements in British banking during his time, and his death deprived the City of London of one of its most vigorous characters. (H. CH.)

Indeed, two "Chancellor" crises within four months had done much to undermine the whole system of Imperial and Prussian semi-absolutism, and to shake the confidence of the masses in the possibility of a successful issue of the war. The failure of the spring and summer offensives of 1918 destroyed Hertling's hope that he might eventually be able to negotiate with the Allied and Associated Powers on anything like equal terms. Feeling among the masses and also in large sections of the army was giving cause for great anxiety. The necessity for the introduction of real parliamentary government, against which, in accordance with the conservative principles of a lifetime, he struggled, became paramount. His health too was broken. His resignation was accepted on Sept. 30 1918. He died on Jan. 4 1919 at his country home at Ruhpolding in Upper Bavaria. He left reminiscences which were published in 1919 under the title of *Erinnerungen aus meinem Leben*.

**HERTZOG, JAMES BARRY MUNNIK** (1866– ), Dutch South African politician, was born at Wellington, Cape Colony, in 1866, and was educated at the Victoria College, Stellenbosch, going afterwards to Amsterdam University. Returning to South Africa he settled in the Orange Free State, where he was called to the bar and was appointed a judge in 1895. During the South African War of 1899–1902 Hertzog served as a Boer general, though without conspicuous personal distinction in the field. Nevertheless he emerged from the war as one of the recognized leaders of the Free State Dutch, and took a leading part in the consultations of the Dutch leaders which preceded the Peace of Vereeniging. He resisted the policy of making an end of the war, and held out to the end against the moderate counsels of Transvaal leaders such as Gen. Botha and Gen. Smuts. This difference was smoothed over later, but the memory of it persisted and had a potent influence on the course of South African history. When responsible government was granted to the Orange River Colony in 1907 Hertzog became Attorney-General and Minister for Education with Abraham Fischer as Prime Minister. As Minister of Education he pursued with determination a policy of placing Dutch side by side with English as the medium of education, a policy sound enough in view of the racial circumstances of the country, but demanding the utmost skill and tact in its administration. Hertzog showed none of the gifts of the skilled administrator, and as his methods revealed themselves resentment and suspicion grew among the English-speaking people of the colony and from them spread throughout South Africa. The circumstances of the time were difficult enough in themselves, but the contrast between the methods of the Botha Government in the Transvaal as to education and those of the Fischer Government in the Orange River Colony was for all to see. The complications of Hertzog's administration of the Education Department culminated in the summary dismissal by him of Mr. Fraser, an English-speaking inspector in the service of the Department. Hertzog justified this summary action in Parliament and before his constituents by making public accusations against the *bona fides* of Mr. Fraser, who brought a libel action against him, in which the verdict went heavily against Hertzog. Meanwhile the Union movement grew throughout South Africa. Hertzog was one of the representatives of the Orange River Colony on the National Convention which drafted the Union Act, and took office under Gen. Botha as the first Minister of Justice of the Union of South Africa in 1910. During the meetings of the Convention it had seemed that he was ready to obliterate the racial hatreds of the war, but his conduct as Minister of Justice soon showed that the old spirit of bitterness was still strong in him. He was a thorn in the side of the Botha Ministry, and at the end of 1912 the differences between him and his more moderate colleagues in the Cabinet became so plain that the patience of the Prime Minister could ignore them no longer. In Dec. 1912 Gen. Botha resigned, and taking office again, reconstructed his Ministry, leaving Hertzog out. This was the critical point in a long feud between Hertzog on one side and Botha and Smuts on the other. When the World War broke out, Hertzog, who by then had formed the Nationalist party in the South African Parliament and was in steady opposition to the Botha Ministry, resisted the co-operation of the Prime Minister and Smuts with Great Britain in the war. When, at the end of 1914, some of the Dutch-speaking people went into open rebellion, Hertzog hesitated and attempted to compromise, never bringing himself to utter any straight condemnation of rebellion. This course he and the Nationalists maintained throughout the war, drifting ultimately into a formal claim for a republic in South Africa. In two general elections during 1920, when Gen. Smuts had become Prime Minister after the death of Gen. Botha, Hertzog maintained the Parliamentary strength of the Nationalist party, having refused reunion with the party led by Gen. Smuts on the ground that the claim could not be abandoned.

**HERVIEU, PAUL** (1857–1915), French dramatist and novelist (*see* 13.405), produced his last play, *Le Destin est Maître*, in 1914. He died suddenly in Paris Oct. 25 1915.

See A. Binet, *Portrait psychologique de Paul Hervieu* (1914); H. Burckhardt, *Studien zu Paul Hervieu* (1917).

**HEWLETT, MAURICE HENRY** (1861– ), British man of letters (*see* 13.417). Later novels include *Brazenhead the Great* (1911); *Mrs. Lancelot* (1912); *Bendish* (1913); *A Lover's Tale* (1915); *Love and Lucy* (1916) and *Mainwaring* (1918). He edited *Epochs of Philosophy*, a series of twelve volumes written by distinguished scholars of America, Canada and Great Britain.

**HICHENS, ROBERT SMYTHE** (1864– ), English novelist, was born at Speldhurst, Kent, Nov. 14 1864. He was educated at Tunbridge Wells and Clifton College, and then became a student at the Royal College of Music, London, with a view to adopting music as a profession. He was, however, diverted to journalism and later to fiction. During his musical period he published some lyrics and short stories, besides a novel, *The Coastguard's Secret*, at the age of seventeen. But he first attracted serious attention with *The Green Carnation* (1894) and *An Imaginative Man* (1895). He followed these by some novels of London society such as *The Londoners* (1897) and *The Woman with the Fan* (1904); but his principal work in fiction was a series of novels with an Eastern setting, beginning with *The Garden of Allah* (1905), and including *The Call of the Blood* (1906) and *Bella Donna* (1909). He also published certain travel sketches in

1921 from Wessem to Nederweert (10·9 m.) is completed the coal district will obtain better communication via S. Willemsvaart with the N. Brabant industry; this canal will also provide better connexion with S. Holland and Zeeland. In Brabant, a canal for 500-ton ships was completed in 1915 connecting Tilburg, Dongen, Oosterhout and—by a branch—Breda with the Amer and hence with the Hollandsch Diep. The continuation of the canal to the E. of Tilburg towards the S. Willemsvaart was in course of execution in 1921: this Wilhelmina canal will have a length of 42·5 miles.

The waterways from the large ports of Rotterdam and Amsterdam are continually being improved. The New Waterway, which joins Rotterdam with the North Sea, was given a depth of 10·5 metres at ordinary high-water or 9 metres at low-water; and in 1921 it was being deepened to 11·5 metres and it was intended to increase the depth subsequently to 12·5 metres and widen the navigable channel and reduce the reaches. An improvement of the Noordgeul and the Oude Maas was also in progress whereby the current will be improved and the port of Dordrecht made accessible to ships with a draught of eight metres.

Amsterdam communicates with the sea via Ymuiden. At this port there are three locks for ships of 200 metres length, 24 metres width and 92 metres draught. A fourth, 400 metres long, 50 metres wide and 15 metres deep, was under construction in 1921. This width is one and a half times that of the locks of the Panama Canal, which are also 3·3 metres shallower. The outer harbour at Ymuiden was being enlarged and deepened. A scheme for the improvement of Amsterdam's communication with the Rhine was being prepared. In the E. of the country a canal system over 73 m. in length, decided upon in 1919, is to run from Almelo via Hengelo and Enschede to the Upper Rhine. In this way good water communication will be obtained from these important industrial districts to the great rivers and thus also to Rotterdam.

*Railways and Tramways.*—In railway affairs in the Netherlands there is an increasing tendency towards concentration.

In 1917, after a period of sharp competition, the "Hollandsche Spoorweg Maatschappij" (Holland Railway Co.) and the "Maatschappij tot Exploitatie van Staatsspoorwegen" (State Railways' Co.) which dominated the entire railway system, came to an understanding for furthering their common interests.

The movement in favour of nationalization of railways has grown stronger and stronger, and the fresh agreements concluded between the State and the two companies in 1921 accorded a complete preponderance to the State. By these agreements, the capital of the companies was augmented from £3,375,000 to £7,500,000, the State providing the increase and thus becoming the chief shareholder, with a majority of votes in the Board of Directors.

The railway system was extended between 1900 and 1920 by about 379 miles. Its total length in 1919 was 2,381 m., of which 1,228 m. were double-tracked; the combined length of railways with limited speed possibilities and of the tramways was 1,843 m., 161 m. being double-tracked.

In 1913 the line Eindhoven-Weert was added to the great railway lines. It has a length of only 18 m., but constitutes a great improvement in the communication between the provinces of Holland and Utrecht on the one hand, and Limburg on the other; since its opening, the trains run via Boxtel, Eindhoven, Weert and Roermond to Maastricht and the rapidly developing mine districts. In 1907–8 a local, electrically worked line was laid from Rotterdam to The Hague and Scheveningen (20¼ m.). Of great significance is the local railway which relieved the isolation of the prosperous agricultural and market-gardening districts around Haarlemmermeer, joining such places as Hoofddorp, Aalsmeer, Uithoorn, Alphen and Oudshoorn to Leiden, Haarlem, Amsterdam and the main line from Amsterdam to Utrecht (by Nieuwersluis). Its total length is about 74 miles. Among other extensions in progress in 1921 were local railways and tramways in S. Limburg and Dutch Flanders.

In principle it has been decided to electrify some of the main lines. At the same time it is intended to relieve the main lines of the local traffic by the construction of new tramways and the electrification of old ones. For example, the steam tramways from The Hague to Leiden and from Leiden to Haarlem were to be electrified. Between Rotterdam and The Hague and between Haarlem and Amsterdam, electric traffic lines were already in existence. Various steam tramways had already been electrified or were being converted.

The State usually subsidizes the construction or improvement of local means of communication, provided both the communes and the provinces concerned manifest sufficient financial interest.

On the Netherland railways there were in use, in 1919, 1,363 locomotives, 4,823 passenger carriages and 29,734 goods wagons. The number of passengers carried increased from 46,221,001 in 1910 to 76,361,000 in 1916. The shrinkage of traffic possibilities by reason of the coal dearth and the raising of tariffs caused passenger traffics to recede to 64,326,000 in 1917, 60,613,000 in 1918, and 60,248,000 in 1919. The goods traffic reached its maximum, 20,183,000 tons, in 1913; it fell to 13,819,000 tons in 1919.

On Dec. 31, 1918 the tramways owned 567 locomotives, 3,028 passenger cars and 3,479 goods trucks. Traffic had been continually rising; it totalled in 1918 296,140,000 persons. The goods traffic likewise continued to increase, the amount carried in 1918 being 2,298,775,000 tons.

In 1908 Amsterdam mean time (20 minutes fast on Greenwich mean time) was adopted on the railways and in the post-offices.

*Post, Telegraphs and Telephone.*—The post-offices in 1919 numbered 1,702, (1910, 1,494). The number of letters and post cards delivered per head of the pop. was 60·4 (1910,46). In 1920 there were 1,421 telegraph offices (1911, 1,048).

The telegraph lines covered 5,137 m. (1911, 4,677), the total length of the wires being 29,417 m. (1911, 22,302).

The telephone system had been gradually brought under State control. Good progress had been made with the replacement of overhead wires by underground cables between the chief commercial centres, the Pupin system being used.

The radio installations at Scheveningen and at the State navigation stations handled 10,500 telegrams in 1910 and 20,900 in 1919.

During the war, the need for direct wireless communication with the Dutch East Indies was keenly felt. This communication was nearly complete in 1921. Near Bandoeng (Java) a temporary station had been erected, while in Holland the receiving station at Sambeek was also ready; the sending station at Kootwyk, some 31 m. distant, has six steel towers 700 ft. high.

A few small stations for wireless telegraphy and telephony were placed at the service of aerial traffic and the meteorological office.

Moreover, radiography is employed to relieve the long telegraph wires and cables on land. The chief telegraph office at Rotterdam has wireless communication with Germany. It was expected that a similar service between Amsterdam and England would be opened.

*Aerial Communications.*—In 1921 a daily aerial service for passengers, post and goods was instituted between Amsterdam-Rotterdam-London, Amsterdam-Rotterdam-Brussels-Paris and Rotterdam, Amsterdam-Bremen-Hamburg.

*Agriculture and Market Gardening.*—In the years immediately preceding the World War, Dutch agriculture and market gardening had devoted increasing attention to the export trade. Situated between such characteristically industrial countries as England, Belgium and Germany, where the general prosperity of the people enabled them to purchase products whose value is not chiefly determined by the area of soil necessary for their cultivation but rather by the labour required, Holland was in a position to carry on intensive agriculture and market gardening with the certainty of finding ample market for the lucrative sale of her output.

Corn-growing gradually dwindled, and remained of some importance only in the province of Groningen (where the strawboard industry made straw a valuable by-product) and in the sandy districts of Drenthe, Overyssel, Gelderland, N. Brabant and Limburg, where the rye grown was used in combination with enormous quantities of foreign fodder for the maintenance of live stock which, in comparison with the size of the farms, was exceptionally numerous and provided meat, dairy products and eggs for the export trade.

The reduction of corn-growing was coupled with an expansion of potato and beet cultivation; while a comparatively important place was occupied by various products such as rape seed, mustard seed, flax, canary seed and caraway seed. In the fen districts of Groningen, Drenthe and Overyssel potatoes were grown for the potato flour factories. Although the area of grass-land did not greatly increase, the quantity of live stock was continually added to. Large imports of foreign fodder made it possible to increase the number of cattle, this fodder being used even in the pasture districts of Utrecht, Friesland, N. Holland and S. Holland. Foreign grain and oil-cake were converted into meat and dairy produce to be exported, in their turn, to the industrial countries already mentioned.

Much care was bestowed upon the breeding of good cattle, whereby Holland came to possess magnificent stocks. As a consequence Dutch cattle were much sought after for breeding purposes both in Europe and in oversea countries.

Owing to its favourable geographical position, Holland was able to place its vegetables on the markets of neighbouring countries in a fresh condition, and the climate and soil being specially suitable for the cultivation of vegetables, it is natural that market gardening assumed extensive proportions. The country became more and more the vegetable garden of the industrial districts. Certain market gardening centres devoted themselves to the cultivation of bulbs, fruit trees, ornamental shrubs and table flowers, all of which were exported to countries near and distant.

This orientation of agriculture and market gardening placed Holland in a very difficult position during the war. For the feeding of its people and its cattle it was dependent upon foreign supplies which, especially after 1916, were largely cut off. Numerous Government regulations of a very irksome character for the agriculturist and market gardener became necessary in order to direct the production of food-stuffs requisite for the support of the Dutch population as well as of the many interned and the charitably entertained Belgian refugees. These measures included the obligation to convert grass-land into arable soil and to limit various crops not primarily essential as human food. Notwithstanding these measures, distress became acute, and the World War ended only just in time to prevent a general famine.

After the close of the war it became possible gradually to restore to agriculture the free exercise of its functions. Every effort was made to raise the diminished cattle stocks to their old level and to give them in other respects their pre-war position.

The State gives assistance on a large scale by well-organized instruction in agriculture, market gardening and cattle breeding, by the advice of State agricultural, horticultural and dairy experts, by the experimental Government stations, etc. Useful work is also performed by various organizations, such as the Royal Netherland Agricultural Committee, the Netherland Heath Society (reclamation of waste land), the Netherland Market Gardening Council and the Netherland Cattle Herdbook; while the coöperative movement is continually extending its influence among the farmers and in the dairy works. The quality of the dairy produce stands under strict control and can be guaranteed by Government stamps under which butter with not less than 80% of fat and not more than 16% of moisture, cheese with minima of 45%, 40%, 30% and 20% of fat may be sold.

Of the whole surface of Holland, being 3,263,541 hectares (1 h.a. = 2·47 ac.), in 1919 2,461,112 h.a. were in cultivation, viz.: arable land 908,622 h.a., pastures and meadows 1,207,743 h.a., gardens 59,796 h.a. (market gardens 24,327 h.a. and under seed cultivation 817 h.a.), orchards 25,698 h.a., arboriculture 2,718 h.a., floriculture 591 h.a., bulb-growing 4,889 h.a. and woods 249,055 h.a.

Small and medium-sized concerns are preponderant in Holland, more than half cover 1 to 5 h.a. each, about 20% 5 to 10 h.a., 14% 10 to 20 h.a. and 11% 20 to 50 h.a. Cultivation is very intensive.

*Trade and Shipping.*—Holland occupies a prominent place in international trade and shipping, thanks to its favourable geographical position, its well-equipped ports, its rich colonies and the commercial abilities of its inhabitants. About 18% of the bread-winners are engaged in trade and transport, against 27% in agriculture, etc., and 34·5% in industry. But this situation, so favourable in normal times, was a source of serious disadvantage during the World War. It was essential to the Allies to cut off, as far as possible, the influx of supplies to Germany. The consequent blockade of Germany caused the collapse of the Dutch import and transit trade; while the dangers arising out of the sea-mines and the submarine warfare first hampered and finally arrested altogether Dutch navigation and oversea export. Furthermore, overland trade with Belgium, France, Switzerland and Italy was absolutely paralyzed. The result was that Holland, both as regarded the export of its surplus output (particularly perishable agricultural and dairy products) and also the importation of indispensable commodities (coal, iron, etc.), became more than ever dependent upon the Central European countries, the only ones with which unimpeded traffic was possible. This traffic was controlled by the Nederlands Overseas Trust (N.O.T.)—a trade association created for the purpose and therefore dissolved after the war. Managed by leading business men, the N.O.T. kept in regular contact with the Dutch Government as well as with the blockading Powers, and, by undertaking the supervision of oversea imports so as to prevent their reëxportation to the Central Powers, it enabled the Allies to allow into the Netherlands from abroad such articles as the country required.

The unrestricted U-boat warfare, the tightening of the blockade and, finally, the requisitioning of a great portion of the Netherland mercantile marine by the United States in 1918 produced a complete dislocation of Dutch trade, which, in its effects, outbalanced the profits accumulated in the early days of the war by reason of the high prices which the Central countries had been prepared to pay for Holland's surplus of agricultural and dairy produce. In 1917 trade with Germany showed a balance of about £2,670,000 in favour of Holland, but in 1918 there was an adverse balance of over £15,000,000; trade with England in 1917 amounted to £26,500,000, but was reduced by the obstacles at sea in 1918 to £6,625,000.

After the war Dutch trade remained utterly dislocated. Germany, who had been one of Holland's best customers, appeared to have lost her purchasing capacity; Russia had vanished from the market. The rest of the world continued to suffer from the war's aftermath. In Holland, notwithstanding the appearance of a class of *nouveaux riches*, there proved to be a general impoverishment.

To obtain, therefore, an idea of the development of Dutch trade, it is necessary to revert to pre-war years. War-time and post-time data reflect only abnormal conditions.

In 1913 the imports totalled 66,488,516 metric tons (1910, 47,580,053) and the exports 45,033,122 (1910, 35,529,824). The imports consisted mainly of colonial produce (tobacco, coffee, tea, tin, hides, spices, cocoa, copra, etc.), raw materials (ores, coal, timber, cotton, wool, etc.), bread-stuffs, feeding-stuffs and manufactured articles.

Holland exported principally agricultural and horticultural produce (potatoes, vegetables, flower bulbs, seeds, fruits), horses, cattle, meat, fish and shell fish, butter, cheese, condensed milk, margarine, sugar, jams, potato flour, cotton and woollen piece-goods, shoes, electric lamps, strawboard, gin, beer and other alcoholic beverages, cocoa and chocolate, tobacco and cigars, glassware, paper, vegetable oils and oil cakes, etc. Imports by sea amounted in 1913 to 26,020,444 and exports by sea to 10,090,387 metric tons. Imports and exports by rivers and canals at the eastern and southern frontiers totalled in the same year 53,146,224 metric tons (imports 23,856,170 and exports 29,290,054). These figures illustrate the transport capacity of the Dutch river fleet. Imports by railway amounted in 1913 to 10,611,902 and exports to 5,652,681 metric tons.

*Seaports.*—Geographical conditions predestine Holland to a large transit trade, which in 1913 reached a total of 2,488,957 metric tons. The rivers Rhine, Meuse (Maas) and Scheldt, the principal trade routes of Western and Central Europe, having their estuaries on Dutch territory, the Dutch ports Rotterdam and Amsterdam form the gateways to a large part of Europe. Both ports are connected with the North Sea, the former by the New Waterway from Rotterdam to the Hook of Holland, the latter by the North Sea canal from Amsterdam to Ymuiden. Whereas the New Waterway is an open channel, the North Sea canal is provided with locks. The expenditure for the construction of the North Sea canal amounted in the years 1865–83 to 51,000,000 guilders; from 1883 till 1913 a further amount of 19,000,000 guilders was spent.

There is considerable difference in the position of Amsterdam and Rotterdam in international commerce. While Amsterdam disposes of a large portion of the foreign merchandize it receives directly, Rotterdam owes its importance to the fact that it is largely a transit-port. The length of the quays at Rotterdam now reaches the impressive figure of 30 miles. Loading and unloading are effected by means of the most modern appliances: electric cranes, pneumatic grain elevators, coaltips, etc. The total area of the harbours is about 6,000,000 sq.yds., not including the area of the New Meuse, which itself forms a large anchorage. The following figures relating to 1913 give an idea of the extent of the Rotterdam sea-borne traffic: tonnage of out-going ships 13,796,691 and of in-going ships 13,748,784, together 27,525,475 tons. In 1918 this figure had receded to 2,577,321 tons, but rose again in 1919 to about 6,500,000 tons and, in 1920, despite a two months' harbour strike, to 8,000,000 tons.

Rotterdam possesses the considerable advantage of being situated at the mouth of two such important rivers as the Rhine and the Meuse. In normal years the number of river vessels calling at Rotterdam is enormous. It is quite a common thing to see Rhine cargo-boats having a tonnage of 3,000 cub. metres. The following figures show the development of the shipping traffic on the Rhine and its division among Rotterdam, the rest of the Netherlands and Belgium.

Rhine shipping traffic ex-Germany in cub. metres:—

| | With Rotterdam | With the rest of Holland | With Belgium |
|---|---|---|---|
| 1910 | 17,663,521 | 3,936,174 | 7,727,219 |
| 1913 | 22,764,241 | 5,177,136 | 9,073,140 |

In like manner the smaller inland navigation and local shipping increased by leaps and bounds, so that including the Rhine shipping there were in 1913 140,469 vessels entering the port of Rotterdam, aggregating about 30,500,000 cub. metres capacity. For 1920 these figures were: 142,124 vessels and 26,613,225 tons.

Amsterdam is the principal centre for the home trade and for the world's trade in colonial produce. The public sales of tobacco, tin, coffee and spices are visited by numerous foreign buyers.

Amsterdam is also a large importer of Peruvian bark and capoc, and possesses important local industries, its diamond cutting enjoying a world-wide repute. The Amsterdam Exchange occupies a leading position in the world's money market.

The harbours of Amsterdam have a quay length of seven m., the water area accessible to ocean vessels covers 2,600,000 sq. yards. Its timber docks which next to those of London are the largest in Europe, have an area of 375 ac., the petroleum harbour comprises 70 ac., and the surrounding property, with tank capacity for 155,000 bar., measures another 30 ac. The harbour traffic of Amsterdam in 1913 totalled 4,347,000 tons, the returns fell greatly during the war, but reapproached pre-war figures in 1920; in the first quarter of 1921. the harbour movements reached 1,588,388 tons.

Of the minor ports Zaandam in the immediate neighbourhood of Amsterdam is a well-known centre of the timber trade. Harlingen on the Frisian coast has an extensive export to England of cattle, meat, dairy produce, potatoes and eggs; Delfzijl is near the German frontier and Flushing has the mail service to England.

As a centre of great shipping enterprises Holland ranks very high. The great Dutch steamship companies maintain services to almost every important port in the world.

In 1920, by the coöperation of 11 of the largest companies, the "Vereenigde Nederlandsche Scheepvaart Maatschappij" was founded, with a capital of £16,700,000, its object being the creation or continuation of lines to the East Indies, Australia and Africa.

The total tonnage of the Dutch mercantile marine (excluding steamships and motor-vessels of less than 500 tons and sailing ships) amounted on Jan. 1 1921 to 1,863,688 gross register tons.

*Ship Building and Ship Repairing.*—During and after the war, ship building made great progress in the Netherlands. On Dec. 31 1901, Dutch yards had, under construction and on order, only 33,700 gross register tons; on Dec. 31 1914, the figure had risen to 185,000. In 1915 there was a leap to 406,045 tons, and on Dec. 31 1918, the figure was 477,850.

Peace gave a startling impulse to the industry; on Dec. 31 1919, the total had risen to 740,675 gross register tons, but fell again to 561,035 by Dec. 31 1920. Although the Netherlands mercantile marine increased to 375,475 tons in 1920, the high ship-building returns of 1920 were chiefly due to foreign orders, since a considerable portion of the increase in the Dutch merchant fleet came from abroad. Dutch ship building gave employment to 25,000–30,000

workmen in 1921. The principal yards were at Amsterdam, on the Maas from Vlaardingen to Dordrecht, and at Flushing.

Remarkable progress has also been made in the ship-repairing industry, which was formerly of no great significance. Rotterdam had 12 dry docks with a total lifting capacity of 97,000 tons, the largest being for 15,600 tons. At Schiedam, Wilton's Factory had a floating dock of 46,500 tons. Amsterdam had four dry docks with a lifting power of 3,000, 4,000, 7,500 and 16,500 tons.

*Industries.*—During the World War, Holland was, by the measures of the belligerents, largely thrown on its own economic resources. Industry adapted itself as far as possible to the new circumstances by paying greater attention to home requirements. It devoted itself to the production of a number of articles previously obtained almost exclusively from abroad, such as: porcelain insulators, motor cylinders, drawn wire, fire extinguishers, kid gloves, clothiers' machinery, asbestos plates, press buttons, electric pocket lamps, wax images, sewing cotton, laboratory glass, incandescent lamp globes, toys, office requisites (writing cases and carbon paper), chloride of lime, sulphur chlorate, aniline colours, saccharine, bromides, chlorate of potash, synthetic scents, iodine compounds, narcotic ether, siliceous varnish, artificial horn (galalith), rubber articles, felt, flying machines, typewriters, etc. Various industries are rapidly extending, especially ship-building, the manufacture of implements and tools, glow lamps, margarine, cigarettes, etc.

An indication of industrial development is to be found in the number of boilers in use for factory plant and in the area of their heating surface. The number of boilers in use at the close of the years 1911, 1916 and 1918 were 7,455, 7,779, 7,973 respectively; the heating surface, in sq. metres, being 347,876, 431,077 and 467,158. The application of electric energy is continually on the increase.

Data concerning the number of workmen in the various industries, provided by the Inspector of Labour, show that in factories of more than 25 workmen, the number employed was 339,150 on Feb. 1 1920, as against 313,944 on May 1 1914, exclusive of the sugar factories which work from April 30 till Jan. 31 and employ about 10,000. The metal trade, together with machine building and ship building, occupied the largest number of workmen. Next in order followed the textile trade; the earthenware and glass industry; the clothiers; tobacco and cigars; timber, cork and strawboards; the chemical trades; printing works; the diamond industry; paper-making; leather and rubber industries.

*Mining.*—The Netherlands coal-mining industry showed a curious growth. The necessity in war-time of supplying requirements out of home resources led to vigorous productivity, with the result that the output was more than trebled (1,280,000 tons in 1910, increased to 3,940,000 tons in 1920). Above all, the State mines (Wilhelmina, Emma and Hendrik) attained great prosperity in those years. The production is estimated to be 6,000,000 tons in 1925 and probably 7,500,000 tons in 1930.

During the war, the lignite fields of Limburg, which previously were unable to compete with the German industry, were opened up. They produced in 1917 42,442 tons, in 1918 1,425,617; in 1919 1,881,962 and in 1920 1,395,851 tons. The ampler supplies of coal after the close of the war caused the output of lignite to fall off, and it was expected that the decline would become further accentuated, as the exploitation is only remunerative at high prices.

In what measure the Limburg mines rendered Holland independent of foreign countries is clearly reflected in the following figures:—

IMPORTS, EXPORTS AND CONSUMPTION OF COAL IN THE NETHERLANDS IN 1,000 TONS

| Imports[1] | | Exports[1] | Excess Imports | Limburg Output[2] | Available for Consumption |
|---|---|---|---|---|---|
| 1910 | 14,789 | 8,515 | 6,274 | 1,280 | 7,532 |
| 1911 | 16,378 | 9,824 | 6,554 | 1,463 | 8,017 |
| 1912 | 18,250 | 10,980 | 7,270 | 1,717 | 8,987 |
| 1913 | 20,466 | 12,382 | 8,084 | 1,837 | 9,921 |
| 1914 | 16,315 | 8,999 | 7,316 | 1,890 | 9,206 |
| 1915 | 9,881 | 2,594 | 7,287 | 2,250 | 9,537 |
| 1916 | 8,431 | 2,208 | 6,223 | 2,563 | 8,786 |
| 1917 | 3,044 | —[3] | 3,044 | 3,007 | 6,051 |
| 1918 | 1,486 | —[3] | 1,486 | 3,806 | 5,292 |
| 1919 | 3,615 | —[3] | 3,615 | 3,939 | 7,554 |
| 1920 | 3,327 | 31[3] | 3,296 | 4,339 | 7,635 |

That the consumption was so much lower in 1919 and 1920 than in 1913 is to be explained by the decrease of bunkering, the reduction of demand in the gasworks, and the depressed condition of certain industries as an aftermath of the war.

The productive coal district of South Limburg covers an area of about 96·5 sq. miles. Experts assess the depth at 8,200 feet. The deposits are to be regarded as an offshoot from the Belgian Limburg beds. In North Limburg there is a second coal region the exploitation of which has been decided upon; it is a continuation of the Westphalian coal-field. In Gelderland coal is also found.

*Salt.*—The difficulty of obtaining sufficient salt during the war led to the exploitation of the salt beds in the E. of Gelderland close to the German frontier. The State Mineral Exploration Service instituted in 1903 had discovered salt deposits near Winterswyk with an estimated rock-salt content of 22,000,000,000 tons, and others near Buurse with apparently 2,000,000,000 tons.

In 1919 the output was 5,244 tons, in the last month of that year 2,000 tons, being one-sixth of the whole consumption in the country.

*Fisheries.*—In 1919 more than 27,000 persons earned their entire livelihood by fishing, while a very large number exercised the craft as a subsidiary occupation or were employed in such callings as sail making, working in net factories, rope walks, cooper's workshops, fish-smoking sheds, tanneries, basket works, etc. In that year the number of vessels engaged in fishing was 6,239, of which 302 were propelled by steam, and 216 were motor-boats, the total capacity being 450,970 cub. metres. High-sea and coastal fishing produced roughly 251,036,000 kg. of fish including shell fish and molluscs; the value was £5,606,216. The river catches (salmon, etc.) weighed 119,000 kg. and was sold for £54,133; no returns are obtainable concerning other freshwater fish.

In 1913 the high-sea and coastal fisheries produced 203,833,000 kg., the value being £2,243,283. Thus the proceeds have increased since the war, but the working expenses have risen to such an extent that the profits of the business are much less favourable. Above all, the collapse of the German exchange has had a very detrimental effect, Germany having been one of the principal purchasers prior to the war. The export of herrings, of fresh fish (trawl fish) and of anchovies suffered extremely.

The Act of Oct. 6 1908, which came into force on July 1 1911, contained regulations regarding all the fisheries, instituting also a Fisheries Board. A decree of 1912 founded a State Institute for Fishery Investigation. There is an Inspection of the Fisheries, charged with the supervision of the fisheries and the carrying out of the regulations. Several towns maintain fishery schools, all endowed by State and Province.

*Constitution and Government.*—The Constitution of 1815 which had already been revised in 1840, 1848, 1884 and 1887, again underwent important changes in 1917, especially with regard to the franchise and education. The number of Ministries in 1921 was 11, viz.: Foreign Affairs; Justice; Home Affairs; Education, Arts and Sciences (since 1918); Marine; Finances; War; Public Works; Agriculture, Trade and Industry (since 1908); Labour (since 1918) and Colonies. Public Works included the whole system of transport, Labour and public health.

The States-General consisted of a Second Chamber (Deputies) and a First Chamber (Senate). The Second Chamber consists of 100 members chosen, since 1917, for a period of four years according to proportional representation, by secret, general and single male franchise, while after 1919 the law made use of the powers granted by the revised Constitution of 1917 to extend the franchise to women.

The franchise is granted at the age of 25, and since 1917 the constitution has made voting compulsory. Membership of the Second Chamber, a position which may not be held under the age of 30 years, has attached to it a yearly indemnity of £250, while travelling is free for members. Retired members enjoy a pension of £8 6s. 8d. for every year of service to a maximum of £166 13s. 4d.

The First Chamber consists of 50 members, chosen by the Provincial States for the term of nine years. Every three years a third of the number resigns. They are chosen by absolute majority of votes, each province sending a quotum according to population.

The conditions for eligibility are the same as for the Second Chamber. The members have the right of free travelling, while those who do not live in The Hague where the States-General meet, receive the sum of £1 13s. 4d. per day for expenses.

The Provincial States and the Municipal Councils are elected for four years under the same franchise conditions as the Second Chamber. The salary of the Burgomaster varies from £41 13s. 4d. to £1,666 13s. 4d. (Amsterdam).

Worthy of special mention also are the "Waterschappen," "Veenschappen" and "Veenpolders" (bodies charged with the survey of dikes, peat land, etc.), elected by those interested in the maintenance of the dikes, the draining of polders, etc. They have power to make regulations in their own interests, according to legal rules, but are also subject to the control of the Provincial States.

Since the introduction of general female suffrage the number of electors for the Second Chamber totals 3,250,247 or 97·6% of the inhabitants over 25 years of age. In 1917, that is prior to the introduction of universal suffrage, the total was 1,079,475, being 70·8% of the male population above 25 years of age, or about 35% of the total inhabitants above 25 years. (Proposals for a new general revision of the constitution were introduced on March 22 1921.)

[1] General imports and exports until 1917; both coal, coke and coal and lignite briquettes are included in the figures.

[2] We have not reckoned the bunker coal, which is mentioned under exports in the Trade statistics since 1917, as exports.

[3] Including lignite calculated as coal.

*Finance.*—Holland, it is true, was not directly involved in the war, nevertheless, the four years' mobilization, the equipment of army and navy, the provision of daily necessaries and the care of refugees during the war, as well as the measures on behalf of the demobilized and the unemployed and those required to meet the housing shortage and the rise of salaries after the war, caused such heavy expenditure that the Dutch finances became greatly over-burdened. The "War" expenses alone amounted to £165,000,000, of which a portion was at once met by taxation. The national debt showed an increase from £96,355,000 in 1913 to £216,604,000 in 1921; it had thus been more than doubled during the war. For the amortization of the "War" debt special taxation was voted for the formation of a loan fund, whereby it would be possible to pay off this special debt in from 22 to 25 years. From 1915 to 1919 £24,107,737 was paid into the loan fund.

The burdens imposed upon the people were therefore very heavy, particularly as the communes, upon which, in Holland, an important share of the administrative task devolves, also had to make heavy disbursements in connexion with the war. The consequence was that the direct taxes of the realm, the provinces and the communes grew from £1 9s. 5d. per head of the population in 1913 to £5 16s. 5d. in 1918–9. After then, taxation was noticeably increased, while the above figures take no account of the rise in excise, indirect taxes and various tariffs. The direct and the indirect taxes of the realm, and the excises, grew from £2·25 per head of the population in 1913 to £7·9 in 1919. The War Profits Tax produced by Nov. 1 1920 £50,000,000. The total national revenue, which in 1913 amounted to £18,851,888, increased to £56,187,634 in 1919, and in 1921 was estimated at £46,012,609. The total national expenditure, £19,893,955 in 1913 and £74,054,597 in 1919, was estimated for 1921 at £69,273,810.

The ratio of metal to the note issue of the Netherlands Bank remained very favourable throughout the war.

| | Notes issued | Gold coin and bullion in £ | Total metal stocks in £ |
|---|---|---|---|
| 1910 . . . . | £23,296,000 | 10,904,500 | 13,233,000 |
| 1919 . . . . | £85,264,500 | 52,906,000 | 53,609,000 |
| June 1921 . . . | £84,415,703 | 50,488,597 | 51,541,553 |

According to the latest estimates in 1921 the direct taxation of the realm *per capita* of the population amounted to fl.40·50, and indirect taxation to fl.35. Local rates amounted to fl.40, provincial rates to fl.3, total fl.118·50 (£9 17s. 6d.). The entire pop. of the Netherlands, therefore, on a total taxable revenue of 2,000,000,000 guilders, pays fl.830,000,000 in taxes, *i.e.* more than 40%.

*National Defence.*—The Dutch army is in the main a Militia army. Of the 60,000 men at disposal 23,000 are annually selected by lot for the first period of service which lasts six months for infantry but longer for cavalry, engineers, etc.

These men, who are liable to service from their 20th till their 31st year, form, in the event of mobilization, an immediately available army of over 200,000. By calling up older levies and drilling those previously exempted an army of 400,000 men was obtained in the period from 1914–9, while a reserve was also at disposal. These forces constitute a field army of four divisions of three brigades each, the brigade comprising two regiments of infantry, one regiment of artillery and one of cavalry; besides these there are the auxiliaries, the garrisons of the lines, coast guards, frontier guards, etc.

Holland was prepared for mobilization as early as July 28 1914; mobilization started on Aug. 1, and by Aug. 4 it was complete.

The army is officered by about 2,000 professional commissioned and 5,000 professional non-commissioned officers, supplemented, during mobilization, by about treble that number of reserve officers and non-commissioned men.

The army in the Dutch East Indies (Java, etc.) is absolutely independent of the home forces. It consists of voluntary regulars to the number of about 36 000 men, to which, in recent years, a small addition of conscripts has been made.

The navy in 1921 comprised 5 ironclads, 2 armoured cruisers, 1 protected cruiser, 3 armoured gun-boats, 4 gun-boats, 16 mine layers, 4 mine sweepers, 8 destroyers, 11 torpedo boats, 24 submarines and a large number of small coastal vessels. It does service both in the home waters and in the Indies. It is equipped with volunteers, supplemented by an annual contingent of 800 to 1,000 conscripts.

In the 1921 budget, the army figured with almost £6,250,000 and the navy with more than £4,350,000, being about £1 11s. 0d. per head of the population.

*Labour Legislation.*—Although Holland began somewhat late and hesitatingly with its labour legislation, that legislation assumed such a development during the ten years following 1910 that in 1921 it occupied a leading place. The first effort to remove social evils by legislation dates from 1873, in which year the employment of children under 12 years of age was prohibited. But a parliamentary enquiry in 1887 showed that the Act had not had much effect. Investigations led to the Act of 1889, which was repeatedly extended till, in 1919, a highly important change was achieved by an Act applicable to factories and workshops, bakeries, shops, offices, pharmacies, coffee houses, hotels and hospitals (but not to agriculture, horticulture, arboriculture, mining or household work) which introduced, in principle, the 8-hour day and the 45-hour week. Holland thus took the leading place and even went beyond the requirements of the Washington Conference of 1919: except in the occupations mentioned above, these regulations have been gradually introduced. In bakeries, all work is prohibited on Sunday and from 8 P.M. till 6 A.M. As a general rule, work must cease on Saturday at 1 P.M. All work is forbidden for children under 14 years of age, and in general, Sunday employment and night work for persons between 14 and 18 years.

In cases prejudicial to health, morals or life, any particular work may be forbidden by royal decree to young persons and women. Women are not permitted to work for at least two weeks before and six weeks after childbirth.

Special Acts provide for safety in factories (1895), the prohibition of white phosphor in match works (1901), labour in caissons (1905), stone cutting (1911) and harbour work (1914).

*Workmen's Insurance.*—Workmen's insurance in Holland began with the Accident Act of 1901. This Act was applicable only to factories and workshops with power machinery, but was extended to all cases in 1919. Only agriculture, horticulture, arboriculture, sea fisheries and navigation were excepted. For the last, a temporary regulation was adopted in 1919 as continuation of a regulation made in 1915 for war accidents at sea. The accident premiums are paid by the employers. Mutual accident insurance in agriculture and arboriculture has existed since 1909.

In 1913 a compulsory sickness and old age insurance bill was passed, and regulations immediately came into force whereby workmen 70 years old at that date were granted a pension of two francs per week (married couples together three francs); in 1919 these sums were increased to three francs and five francs and the age limit was lowered to 65. The Act itself, however, was not promulgated owing to the continued conflict between the advocates of State pensions (Liberals, Radicals and Socialists) and the advocates of compulsory old-age insurance with payment of premium by the insured (the clerical parties). This conflict ended in the retention of compulsory insurance with payment of the entire premium by the employer. The age limit is 65 years. Children under 14 years may receive an orphan dole and widows absolutely invalided or not less than 60 years old receive an annuity. For persons not performing hired service but whose economic position is similar to that of workmen, opportunity was given to insure voluntarily against old age, the State undertaking the costs of administration.

*Council of Labour.*—In 1919 a High Council of Labour was appointed composed, partly, of representatives of the employers and the employed, partly of officials, and partly of persons who had made a special study of social and economic questions or of social legislation. This body, of which the Labour Minister is president, was to advise the various departments concerning Labour affairs.

*Housing.*—Owing to circumstances due to the war, the housing problem in the Netherlands also became extremely pressing. Before the war, thanks to the housing law of 1901, the slum dwellings in the great centres of population were being cleared away and the system of cash advances to building societies introduced by this law rendered possible the construction on a large scale of houses for the working and lower middle classes.

The stagnation in building during the years of war owing to a shortage of labour caused by the long duration of the mobilization, and the want of materials, changed the favourable situation existing before the hostilities into one of great need. Legislative measures proved necessary to prevent as far as possible the inflation of house rents, and Acts were passed in 1917, 1918, 1920 and 1921; also the construction of houses by private individuals was encouraged as much as possible by the State by means of loans and premiums. The shortage of houses was greatest and reckoned at 57,550 at the end of 1919, and it was estimated that this number had been reduced to 52,500 on Jan. 1 1921.

*Public Health.*—State supervision of public health was provided for in the Health Act of 1919. The Government is advised by the Health Council. There are health committees in all communes of more than 18,000 souls and in unions of smaller communes aggregating more than 40,000 souls.

*Protection of Children.*—The Compulsory Education Act gave authority to the communes to provide food and clothing for needy children. In various large towns the authorities proceeded to the installation of school baths, and physicians and nurses were appointed; dental treatment was also arranged for.

*Poor Relief.*—The Act of April 27 1912 achieved with regard to Poor Relief an urgently necessary coöperation by instituting joint Poor Councils in which the various public and private charitable institutions are represented. One general Poor Commission, established in The Hague, advises both the Government and the Poor Councils. The principle of the Poor Relief is that precedence is taken by Church or other special institutions and that only afterwards civil relief, exercised by the community, comes into action.

The Church and special institutions may be subsidised by the authorities. The number of charitable institutions amounted in 1917 to 6,880, nearly 60% of which belonged to the churches. In 1917 about £3,500,000 were spent for charitable purposes.

*Labour Movements.*—The comparatively slight importance of the

Dutch industry in the first half of the 19th century prevented the rise of a strong labour movement. It is not until the seventies that one finds the beginning of a real trade organization, and even then the movement developed very slowly, largely because of divisions among the workers. Attempts to combine all workers in one trade, without distinction of political or religious faith and afterwards to organize the various trade unions into one central body, failed. As soon as socialistic tendencies appeared in the labour movement, the denominational workers broke away. The consequence was that five central organizations were established: (1) the Dutch Labour Secretariat, founded in 1893, the members of which are revolutionary—socialistic or anarchistically inclined; (2) the Dutch Trade Federation, of 1905, which is under social democratic influence; (3) the (Protestant) Christian National Trade Federation, founded in 1908; (4) the Roman Catholic Trade Organization Bureau, formed in 1909; and (5) the Dutch Federation of Neutral Trade Unions, founded in 1912 with the aim of uniting the workers of the various political or religious creeds; but which has really become an organization of those who, politically, are liberal or radical. It combined in 1919 with the Central Committee of Neutral Trade Unions as the General Dutch Trade Federation.

The following figures show the development and importance of these various central bodies. The Dutch Labour Secretariat had in 1895, 15,728 members; in 1900, 12,444; in March 1903 (great railway strike), 17,602; in Dec. 1908, 8,000; in 1910, 3,454. Then ensued a reorganization and the adoption of more moderate tactics and in 1915, the membership was 9,242; in 1918, 23,068; in April 1920, 50,140. Again a decline followed; in Jan. 1921 the membership was 36,038. The Dutch Trade Federation had a membership on Jan. 1 1906, of 18,900; Jan. 1 1912, 52,235; Jan. 1 1915, 87,611; April 1 1919, 207,512; April 1920, 262,116. Later the figures declined to 225,367 in Jan. 1921. The Christian National Trade Federation had on Jan. 1 1910, 6,580 members gradually amounting to 76,488 on Jan. 1 1921. The Roman Catholic Trade Organization Bureau Oct. 1 1909, had 9,356 members, rising steadily to 158,222 in Oct. 1920. The General Dutch Trade Federation, after the fusion, had about 48,000 members rising to 51,913 in Jan. 1921.

In Jan. 1921, therefore, these five great labour bodies included 550,000 workers. Outside these there were still a number of smaller organizations but the tendency towards centralization was becoming continually stronger: in 1913, 53·66; in 1918, 77·87; in 1920, 87·53 % of all organized workers had joined these greater organizations and the percentage was still rising.

In the meantime there remained a considerable number of workers who were not organized at all, but a zealous propaganda from various sides unceasingly brought new organizations into existence.

Two factors contributing to the growth and the centralization of the Labour Movement were the collective workers' contracts and the unemployment insurance. With regard to the former, there already existed in 1920, 935 of these agreements which embraced about 22,500 undertakings (1911; 1,100) and over 273,600 workmen (1911; 2,300). From the Catholic side there is a tendency to go still further, aiming at a system of trade councils which would unite the organized employers with the organized workmen.

Insurance against unemployment was steadily extending. While in 1911 only 504 organizations possessed an unemployment fund, this number had risen in 1920 to 4,535. There was an especially large increase after the Government, under the stress of circumstances due to the war, decided to subsidize the unemployment funds by adding 100% to the workmen's own contributions while leaving the management of the funds to the workers, although it exercised a certain measure of control. The number of workpeople insured against unemployment, which in 1911 was only 43,601 and in 1914 was 70,481, had risen in 1920 to 397,900.

*Coöperation.*—Consumers' coöperation is, in the Netherlands, chiefly concentrated in the Dutch Coöperative Union, the Union of Dutch Workers' Coöperations and the Union of Roman Catholic Coöperative Societies, together including about 380 societies with 200,000 members. During the last few years before 1921 a great extension took place in the Coöperative Wholesale Society, "De Handelskamer," which originally acted as a commission agent, but gradually established its own warehouses, and continually brought more of its own wares, with its own special mark, into the market. It possessed also its own soap factory, a factory for wooden shoes, a corn-mill, etc. It embraced in 1917 about 270 societies with about 170,000 members. The return was then—in the difficult years of the war—10,000,000 guilders, but afterwards somewhat decreased.

Agricultural coöperation is much more strongly developed. The Dutch Farmers' Union, established in 1896, is the central organization of the farmers' unions existing in every province, embracing nearly 1,700 local societies with about 200,000 members. In 1913 the various farmers' unions bought coöperatively to the value of over £3,000,000, that is, on an average, about 57 guilders per acre. Soon after there arose a need of centralization in purchasing, and the Central bureau for the purchase of agricultural necessaries was established at Enschede.

In market gardening also, coöperation progressed quickly. The Dutch Market Gardening Council included in 1918 351 societies with 65,700 members.

Coöperation in dairy produce is of great importance. In 1879 the first butter factory was established and in 1886 the opposition of the farmers to the machine-made butter industry in Friesland had so far decreased that the first coöperative butter factory could be established at Warga. Twenty years later there existed 749 coöperative factories (304 of which worked with hand-power) against 226 non-coöperative factories, and 175 coöperative cheese factories against 97 non-coöperative. Again ten years later the industry proved more concentrated, and the figures for butter were 602 (115 with hand-power) and 282; for cheese 236 and 101. The coöperative dairy produce factories, at first provincially organized, combined in the Federative Dutch Dairy Union, which also founded a Central Sale department. In 1917 nearly 10,000,000 kg. of butter were sold directly through this department; the associated factories produced in that year over 1,370,000,000 kg. Through their strict control the dairy produce coöperative factories have had a very favourable influence on the quality of the product.

In the Netherlands agricultural credit is regulated on an entirely coöperative basis through three central bodies, viz. the Coöperative Raiffeisenbank at Utrecht, the Coöperative Central Farmers' Loan Bank at Eindhoven and the Coöperative Central Agricultural and Market Gardening Bank at Alkmaar, which together include over 1,000 local banks with over 92,000 members. Besides these three great organizations there are also a large number of smaller coöperative banks for agriculture and market gardening and for the middle classes. With the exception of the dairy produce business productive coöperation has had little success.

*Education.*—The conflict over the schools, which had dominated the political life of the Netherlands for almost three-quarters of a century, closed in 1917 with the complete victory of the church parties. The Constitution of 1848 had granted the right to give private instruction, but had made public undenominational instruction exclusively "an object of the permanent care" of the Government. Accordingly, the public funds provided for undenominational education. The advocates of denominational education had to pay for that education with their own means, while helping, as tax payers, to support schools which they did not want for their children and which they regarded as pernicious in principle. The undenominational school, with its obligation to respect in its curriculum the religious convictions of everyone, was considered by the parties of the Left suitable for children of every confession. Gradually, however, these parties also coöperated in granting higher and higher subsidies to private schools. There was also a desire to end the conflict in order to devote more energy to the improvement of education generally. In 1917 a modification in the constitution prescribed that education generally, *i.e.* not merely public instruction, was to be an object of the uninterrupted care of the Government. By this change denominational schools were accorded the same rights as the undenominational. As a result a financial arrangement was made in 1919 which benefited them in equal degree.

On the basis of the new article in the fundamental code a new Elementary Education Act came into force in Jan. 1 1921. But whether the "school war" is ended for good and all was open to question. Rather the scene of war was changed: it was transferred to the commune. It was expected that many "public" schools, especially in smaller places, would disappear, and that the number of small private denominational schools would be augmented and the cost of elementary education consequently increased, thereby impeding the improvement of education. Denominational education of a secondary character and as preparatory to advanced study, though it was not yet placed on an equal footing with "public" instruction of the same character as had been done in the case of elementary education, received nevertheless public assistance.

As a whole, Dutch education in all branches stands on a high plane. Compulsory elementary schooling, which was introduced in 1901 (6–12 years), was in 1921 increased to seven consecutive years of instruction (6–13). To this two years may be added. After the sixth year, too, there is considerable opportunity for extended elementary education which lasts three years and may comprise modern languages and mathematics. Preparation for advanced technical and commercial instruction is given in the higher middle-class schools and commercial schools, while the "gymnasia" (grammar schools) prepare for the universities. In addition there is extensive technical or trade instruction.

The care of education, which had previously been entrusted to the Ministry of the Interior, was transferred in 1919 to a special Department of Education, Arts and Sciences. As adviser to the minister a Council of Education was appointed.

The growth of primary education is shown in the following figures. The children attending "public" schools numbered in 1875 386,293; in 1919 575,369; those in private schools numbered in 1875 123,400, and in 1919 432,197. In the latter year there were 3,401 "public" and 2,439 private schools. The results are shown by the percentage of illiterates, which has fallen to 0·2–0·4 per cent.

Between the years 1910 and 1918 the number of higher middle-class schools for boys rose from 85 to 111 and for girls from 16 to 28. The number of boys attending increased from 10,844 to 15,497 and of girls from 4,097 to 7,587. Numerous communes also have commercial schools. In 1910 there were 30 public and 35 private gymnasia, the corresponding figures for 1918 being 34 and 41. The pupils increased in number from 5,373 to 7,552.

There are five humanistic universities; three are State institutions, namely at Leiden, Utrecht, Groningen; while one is municipal and one private, both at Amsterdam. The students numbered in 1909–10 3,945 (671 women), and in 1918–9 5,396 (1,263 women). Besides these universities, there are other institutions which, requiring similar entrance qualifications, are empowered to grant degrees. One is the State technical university (Hoogeschool) at Delft, conferring the degree of "Doctor Ir." (engineering), and admitting in 1909–10 1,121 students (57 women), and in 1918–9 1,866 (123 women); another is the private university of commerce founded at Rotterdam in 1913, conferring the degree of Doctor of Com. and attended in 1918 by 556 (28 women) students. In 1912 the State agricultural school at Wageningen was converted into a State higher agricultural, horticultural and arboricultural school, and in 1918 into an agricultural university (Dr. Agr.), its students then numbering 222. In 1912 a secondary agricultural school was founded at Groningen and a secondary school of colonial agriculture at Deventer. In addition there are 21 State agricultural and horticultural winter schools and a State dairy school at Bolsward. The State veterinary school at Utrecht was raised in 1918 to the status of a university. In addition there are schools of navigation (at Amsterdam and elsewhere), secondary technical schools, academies of plastic art, training schools for teachers, a large number of housekeeping and training schools for girls and institutes for deaf mutes, for the blind and for backward children.

Besides large amounts provided privately the net expenditure on education from the public exchequers (State, provincial and communal), after deduction of revenues, totalled in 1910 over £3,550,000 and in 1917 nearly £5,580,000. Since "public" and private education have been given equal claims to State support and teachers' salaries have been improved, the total estimated expenses for 1921 were not less than £12,500,000.

*Literature.*—Literary development in Holland was marked by a change about the year 1900 after the violent individualism of "the men of the 'eighties." Dogged subjectivity, the principle of "Art for Art's sake" was abandoned, and even under the men of the 'eighties this development attained completion (Gorter, van Eeden). The lyric and naturalistic epic concentrated in the figure of Marcellus Emants (b. 1848); under the influence of French naturalism, French philosophy and of Ibsen especially he became the delineator of degeneration and of the tragedy of heredity (*Waan, Liefdeleven*). This modern realism, with a typically Dutch tint, is to be found in Herman Robbers (*Roman van een Gezin*), Ina Boudier Bakker (*Armoede*), Top Naeff (*Voor de Poort*), de Meester (*Geertje*), Heyermans (*Diamantstad*), and Querido (*Menschenwee, De Jordaan*). Beside it there flourishes a modern romanticism: Arthur van Schendel (*Een Zwerver Verdwaald*), van Moerkerken (*De Bevryden*), Adr. van Oordt (*Warhold*), greatly under the influence of the realism of about 1890.

Louis Couperus abandoned his neurotic *milieu* of The Hague (*Eline Vere*) and turned to the semi-historical and highly imaginative (*Een berg van Licht, Antiek Tourisme, Iskander*). Many modern poets with socialistic ideals aim at an art for the community (Adama van Scheltema, Henr. Roland Holst), while P. C. Boutens (*Carmina, Praeludiën*) under the influence of the classics and philosophers produces intellectual lyrics. Among the younger lyric poets are Aert van der Leeuw, P. N. van Eyck, Geerten Gossaert and J. C. Bloem. The poet-singer J. H. Speenhoff deserves special mention.

In the theatre great progress has been made in this period: Heyermans (*Ghetto, Op Hoop van Zegen*), Mrs. Simons-Mees (*De Veroveraar*), Schürmann (*De Violiers*). As producers, Royaards (Vondel, Shakespeare, Goethe) and Verkade (English Society plays) are well known. The best known actor is Louis Bouwmeester, who, as Shylock, has had great success in London as well as in Paris, Berlin and Vienna.

Dutch critics are Albert Verwey (*De Richting der Hedendaagsche Poezie*), Carel Scharten (*Krachten der Toekomst*), Joh. de Meester, Is. Querido and van Eeden (*Studien*).

*Painting.*—The Hague school has been coming to a close in a number of disciples who miss the great powers and great personality of the Marises (James and William), of Mauve and Weissenbruch. Joseph Israëls died in 1911. Breitner (1857– ), who, although he lived in Amsterdam, may still be regarded as one of the Hague school, had done his best work. Matthew Maris, one of the finest and most subtle Dutch artists of the 19th century, died in 1917. Antagonistic to the Hague school were the pupils of Allebé, the Amsterdammer. Among them one finds such well-known portrait painters as Veth and Haverman, a landscape painter like Voerman, a painter-*littérateur* like Van Looy, painters of fish, Dysselhof, Witsen, etc. Bauer, the great etcher and painter of the East, occupies a place of his own. He is a Romanticist with the technique of the Hague school, just as Isaac Israëls in his painting is more nearly related to the French school, as Manet, etc.

The first revolutionary in Holland was Vincent van Gogh (1853–90). He went to France and was affected by the modern masters of that time. Judging him by his best known work he must, without doubt, be considered one of the greatest Passionates that Holland ever possessed. His influence on some of the younger painters is still apparent. After him come two such contrasting masters, Toorop and Van Konynenburg. Toorop (1858– ) is an admirable portrait painter, a symbolic draughtsman, rich in imagination, a creator of religious subjects (since he became a Catholic in 1905).

Van Konynenburg (1868– ) has long been an opponent of the Dutch impressionism (the Marises, etc.). He has become, like Toorop, chiefly a figure painter; one of the most psychological portraits of our time, that of Boutens, is his work.

Jan Sluyters (1881– ), called by some the Breitner among the younger men, especially with reference to such work as "The Negro," is a naturalistic limner of excellent child portraits, a painter of still life and of landscapes with figures. Leo Gestel (1881– ) is more refined. Cubist in his landscapes (soft in colour) of Majorca, with melancholy in his sunflowers, he is in his later studies of flowers what might be called normal decorative. Sluyters and Gestel are both Amsterdammers. With them may be mentioned Matt. Wiegman. Schelfhout tends towards the archaic in his dry-points. Roland Holst is full of good taste, the painter, after Derkinderen, of mural paintings; Alma is developing also in that direction.

Thorn Prikker (1868– ) has always stood apart. He has the most sensitive feeling for line of any Dutch artist.

*Architecture.*—It is to the credit of Dr. P. J. H. Cuypers (1827–1921), a pupil of Viollet-le-Duc, that, aided by his friend Jhr. Victor de Stuers (1843–1916)—himself a great art connoisseur and patron—he succeeded in arousing general interest in art and, more especially, in architecture and decoration. Cuypers, inspired both by the Gothic and by the Netherland style of the 16th century, built the State museum at Amsterdam and many churches, in which he was frequently assisted and followed by Joseph Cuypers, Bleys and others. The Dutch 17th century Renaissance served as a model to architects such as Gosschalk, Springer, Van Arkel, Van der Steur, etc. Jan Stuyt, De Basel and Leliman turned their attention more to the 18th century. A fresh trend in architecture had emanated from H. P. Berlage, who stresses simplicity and severity of line and the use of brick as a specially suitable material for Holland.

History.—The war period brought a solution of some very important questions in Holland. After the resignation of the Liberal Cabinet of De Meester in 1908, the Government passed into the hands of the "Right" (clerical) Cabinet of Heemskerk (1908–13), which, thanks to the gifted minister Talma, succeeded in passing an act for compulsory insurance. The Heemskerk Cabinet, in the person of its vigorous Minister for War, Mr. Colyn, was able to carry out a reorganization of the army which made it possible for Holland to mobilize very rapidly in 1914 and to strengthen its forces very considerably during the war. The building of a fortress near Flushing aroused at first some dissatisfaction in Belgium, France and England, owing to fear of German influence; but it appeared that Holland aimed merely at an energetic maintenance of its neutrality on the Western Scheldt in the event of war. The World War showed that Holland's neutrality benefited the Allies by preventing the German invaders in Belgium from using the Western Scheldt for submarine warfare.

In 1913 the Heemskerk Cabinet made way for that of Cort van der Linden, which came into power after the refusal of the Social Democrats to accept seats in the Cabinet and the consequent refusal of the Liberal parties to take upon themselves

any responsibility. The State Councillor and professor emeritus, Cort van der Linden, had been Minister for Justice in 1897–1901. This Liberal, who was highly respected both by the Crown and by all parties, formed an "extra-parliamentary" Cabinet, that is, a Cabinet desiring not to be regarded as a mandatory of the Liberal-Socialist majority, though taking over the programme of these parties victorious in the voting. In this way the new Cabinet achieved a revision of the Constitution in 1917. Herein it succeeded in solving the school question which had dominated political life for half a century, and which the parties of the Left also wished to see settled. The talented minister Lely, who for the third time was at the head of the Department of Public Works (1891–4, 1897–1901, and 1913–8), saw his life's work crowned with success in that the States-General resolved to barrage the Zuider Zee.

To a large extent the success of the Cabinet was due to the party truce brought about by the war. But otherwise the war gave rise to great difficulties, even if the country did escape the direct catastrophe of conflict. The geographical position of Holland caused the belligerents on either side to desire that she should not get entangled in the war. In order to protect vigorously her neutrality against any eventuality, Holland herself increased her army to 500,000 men, well trained and equipped as efficiently as possible. Repeated diplomatic differences of increasing poignancy were as repeatedly settled to the satisfaction of all parties by Jonkheer Loudon, the Minister for Foreign Affairs, who inspired great confidence both at home and abroad, adopting throughout the standpoint of recognized positive international law. Nevertheless, Holland suffered greatly from the blockade and the U-boat warfare.

The neutral position of Holland made it possible for her to assist very largely in mitigating distress in the belligerent countries, not merely by sending thither ambulances and aiding in the Relief Work in Belgium and Northern France, but also, and in a special degree, by welcoming the destitute Belgian refugees, who, to the number of over a million, fled for succour to Holland after the fall of Antwerp. Gradually most of these returned home, but even in 1917 and 1918 between 30,000 and 40,000 were still supported by the Dutch Government.

In Sept. 1918 there came a fresh influx of refugees, numbering about 40,000, chiefly from Northern France, as a result of the evacuation caused by the retreat of the German army. On all these refugees the Dutch Government expended certainly some £5,000,000 sterling, which remain to the country's debit. To this are to be added many millions provided by private means. The exchanged British and German prisoners-of-war were also hospitably received. After the fall of Antwerp, too, 30,000 Belgian and some hundreds of British soldiers were interned in Holland—at first in camps and afterwards scattered in various places where they could perform some suitable work. The number of German interned also assumed big proportions, no fewer than 10,000 deserters crossing the frontier. Finally, numbers of military and civil interned managed to escape from Germany into Holland, whither no fewer than 4,000 Russians fled.

Meantime, the elections of 1918 had produced a majority of the Right, which, though weak (51 to 49), enabled the Roman Catholic leader, Dr. Nolens, to form a Cabinet, inasmuch as the Liberals were split into eight groups by the new system of proportional representation and the Socialists had gained seats as a result of general suffrage. Since Dr. Nolens considered it undesirable that he, as a priest, should take a seat in the Cabinet, Jhr. Ruys de Beerenbrouck acted as leader. It was the first time in Holland that a Government accepted responsibility under Catholic leadership.

This Government soon found itself faced with great general dissatisfaction as an outcome of the wartime distress. On the conclusion of the Armistice the desire for demobilization was so great that a serious mutiny broke out. The Social Democratic leader, Mr. Troelstra, announced a revolution in Parliament and demanded the resignation of the Government. But he was not supported either by his own party or by the workmen's organizations. There was a strong revival of patriotism, attachment to the reigning house and feeling for social order. Everywhere civil guards were formed. The army was demobilized and measures were adopted for the benefit of the men. Besides this social reforms were promised. The danger of revolution, which raged close to the frontier, soon began to disappear. Moreover, an improvement in the supply of victuals was noticeable from day to day. The Government had acquired the prestige requisite to introducing important measures into the Second Chamber even with a wavering majority. These included old age and invalidity insurance (Talma Act, 1919), the eight-hour day and 45-hour week, and the Primary Education Act. The Roman Catholic influence was evidenced, *e.g.* by the restoration of a permanent envoy to the Pope; this representation had lapsed in 1870 but had been reinstituted during the war, though only as a temporary measure with the object of coöperating in a possible effort at peace. Meantime, the peace negotiations at Versailles had raised fresh international difficulties for Holland, which gave Jhr. van Karnebeek, the Minister for Foreign Affairs, an opportunity of demonstrating that he pursued a circumspect but persistent policy.

In the early hours of Nov. 10 1918 the Government at The Hague had been surprised by the arrival of the German ex-Kaiser, who sought refuge in Holland. In accordance with ancient Dutch tradition concerning political refugees, the fallen monarch, and, afterwards, the ex-Crown Prince, were accorded the rights of asylum in Holland. When, in 1920, the Allies demanded the person of the ex-Kaiser, compliance was refused on the grounds of that tradition. The ex-Kaiser had his residence appointed in the village of Doorn in the province of Utrecht, that of the ex-Crown Prince being in the Isle of Wieringen in the Zuider Zee. They were allowed to remain in Holland on condition of refraining from all political activity.

Other difficulties arose out of Belgium's desire for a revision of the 1839 Treaties. Holland declared herself prepared to discuss the question at Paris on the basis of equality. This took place. It appeared that Belgium demanded the sovereignty (afterwards softened into "*maîtrise*") over the Western Scheldt and its dependencies, as well as over the canal and railway Ghent–Terneuzen, together with the right to use the Scheldt for defensive purposes in war time—further a *régime* in South Limburg which should guarantee her security, to which end it raised objections to Maastricht remaining Dutch. Moreover, Belgium asked for a canal running direct from Antwerp across Dutch Limburg to the Rhine and another from Antwerp to Hollandsch Diep.

Concurrently, various Belgian journals and the Comité de Politique Nationale demanded that the Western Scheldt, though it had been Dutch since the Middle Ages, Zeeland Flanders (which had been Dutch since the Peace of Munster, 1648), and Limburg (which had been Dutch for the same time; Maastricht even since 1632), should all fall to Belgium. A storm of indignation was aroused in Holland, and the districts in question gave an unambiguous expression of their attachment to Holland. The Dutch Government declined to discuss the question of territorial cessions, but declared themselves willing to coöperate in the construction of the canals, though they denied the necessity for any such waterways. They demonstrated moreover that, during the invasion by the German armies, it would have been disadvantageous to the Allies if Dutch Limburg had been Belgian and that the Western Scheldt would have been used as a submarine basis but for the Dutch character of the river. The Supreme Council decided that the revision of the Treaties of 1839 should be entrusted to a commission composed of representatives of the United Kingdom, the United States, France, Italy, Japan, Belgium and Holland; but the proposals of this commission should, in no case, contain suggestions for a transfer of territorial sovereignty or the establishment of international servitudes; moreover, Belgium and Holland were to endeavour to come to an understanding concerning the waterways. In the subsequent negotiations between these two countries agreement was reached on the administration and maintenance of the Western Scheldt, on the Antwerp–Hollandsch Diep canal, the Antwerp–Meuse–Rhine canal and the administration of the

Ghent-Terneuzen canal. Agreement was reached, but a satisfactory settlement was prevented when, at the close of the negotiations, Belgium expressed the desire also to discuss the question of the Wielingen, which constitutes the estuary of the Western Scheldt and over which Holland had exercised rights of sovereignty since mediaeval times—rights now disputed by Belgium on the ground of the modern notion of territorial waters; according to this conception Belgium would be able to close the Wielingen, *i.e.* the entrance to the Western Scheldt. Holland proposed to settle the matter either by arbitration or by dividing the Wielingen along the middle of the channel, so that Belgium would obtain permanent free access to Zeebrugge and the adjoining North Sea ports, while Holland retained her free access to the Western Scheldt. Nor had Holland any objection to retaining the existing situation, which had never given rise to any difficulties. But Belgium demanded a solution entirely according to her own wishes; and on these grounds she broke off negotiations in May 1920.

Holland joined the League of Nations in 1920, after having participated in the Labour Conference at Washington in 1919 and in the Seamen's Conference at Genoa in 1920. She was also represented at the assembly of the League of Nations at Geneva in Nov.–Dec. 1920. The Permanent Court of International Justice, in pursuance of the resolution of the League of Nations, was domiciled at The Hague.

In June 1921 the Cabinet of Ruys de Beerenbrouck saw their proposals for the reform of the army rejected, and tendered their resignation.

**HOLROYD, SIR CHARLES** (1861–1917), English painter-etcher (*see* 13.618*), died at Weybridge Nov. 17 1917. Many important additions were made to the National Gallery during his period as director, the chief of these being the Rokeby "Venus" by Velasquez. He also arranged for the transference of a large portion of the Turner bequest to the Tate Gallery.

**HOLTZMANN, HEINRICH JULIUS** (1832–1910), German theologian (*see* 13.620), died at Strassburg Aug. 6 1910.

**HONDURAS** (*see* 13.649).—Miguel R. Dávila, president of the republic of Honduras in 1909, was secure in his position only so long as President Zelaya of Nicaragua, whose creature he was, retained control. When Zelaya fell, Manuel Bonilla, the former president, who had fled from Honduras when Amalpa was surrendered in 1907, invaded the country from the north coast in 1910, quickly winning decisive victories. At a peace conference brought about by the United States the presidential power was confided provisionally to Dr. Francisco Bertrand. In the elections which followed Bonilla was successful by a nearly unanimous vote. He ruled until his death in 1913, when Dr. Bertrand, the vice-president, succeeded him. Bertrand was elected to the presidency in 1915. A Liberal revolution in 1919 was due to the claim by opponents of the Government that the election, then approaching, could not be fairly held. Vice-President Membreño and Gen. López Gutiérrez rose in arms against Dr. Bertrand. In Sept. the latter resigned and fled the country. Gen. Gutiérrez assumed dictatorial control, though Francisco Bogran was titular head of the Provisional Government. In the Oct. elections Gutiérrez defeated Membreño overwhelmingly. Deputies to the Congress and judges of the Supreme Court were then chosen.

The return of German property seized during the World War, in which Honduras joined by breaking relations with Germany May 17 1917 and by declaration of war on July 19 1918, was a difficult problem for the new Government, as was also the oft-recurring plan for the union of Central America. The Liberal party in power in 1920 declared itself to be ruling the country constitutionally, and to be labouring for the national development. The Government announced a policy of controlling foreign investments, which were large and important, by securing larger returns to the country from future concessions. Honduran representatives participated in the conference looking toward a unitary rather than a federal Central American union, and in Jan. 1921 signed the pact at San José de Costa Rica which provided for the combination *régime*. The new union was proclaimed Oct. 10 1921, and was composed of Honduras, Guatemala and Salvador. Nicaragua refused to sign the pact. Costa Rica signed, but this action was later rejected by the National Assembly. A new boundary agreement with Guatemala was arranged in Washington in 1919 through the good offices of the U.S. Department of State.

*Economic and Social Conditions.*—The pop. in 1914 was estimated at 562,000 and in 1916 at 605,997. Education showed slight advances during 1910–20. In 1913 there were 916 primary schools with an average attendance of 25,917 pupils. In 1918 there were 965 primary schools with 1,197 teachers, and 93,004 children of school age, of whom 33,127 were in attendance. In 1919 expenditures on education amounted to 384,980 pesos (nominally about £40,000), 63,406 pesos being furnished by the state and 321,574 by the municipalities. The national expenditures for 1916–7 were estimated at £421,261, with revenues the same. In 1919–20 the figure for each was £459,872. The external national debt was estimated on Dec. 31 1914 at £25,871,222, and on Dec. 31 1919 at £27,261,317. No interest had been paid on the debt since 1872. The Government took over the partly built railway contemplated under the original loan, and slightly extended it. On April 17 1920 the National railway, 53 m. long, was delivered by the Government to the Compañía Agrícola de Sula as security for a loan of $1,000,000 to be used in reconstruction of the road. There are over 400 m. of fruit company railways on the north coast and 150 m. of poor automobile roads.

The Banco de Honduras and the Banco Atlantida are the active financial institutions, and in 1920 had paper to the value of $110,000 in circulation. In 1919 the exchange value of pesos and dollars was fixed at two for one, and U.S. currency was made legal tender at that rate. It is practically the only circulating medium. In July 1920 an American economist, A. N. Young, was employed to draw up a financial programme looking toward settlement of the debt, establishment of a national bank, determination of limits for the budget, fixation of a monetary system based on gold, and general economic reforms in the matters of concessions, road building, administration of customs and development of resources.

The banana crop in 1920 amounted to 9,631,568 bunches, worth $2,872,475. Sugar, coco-nuts, silver bullion, concentrates, and hides were the other chief exports. Coffee production increases, while rubber decreases. The coffee exportation in 1919–20 was 1,091,977 lb., worth $216,918. Sugar and alcohol were new exports. Tobacco was raised in El Paraiso and Copan provinces, the crop being about 1,750,000 pounds. Indigo culture was reviving, and the Government subsidized henequin production. Cattle-raising was carried on by over 1,500 ranches, which devoted 150,400 ac. to grazing. Cattle exports fell off from 21,911 head in 1913–4 to 6,482 in 1919–20. Straw hats and cigars were the only manufactures for export.

During the period 1910–20 imports exceeded exports owing to investments of American capital in machinery, etc. The following table is fairly accurate as to imports, but in addition to the exports reported there are large clandestine transactions, and prices below the market are often used in compilation of statistics.

** These figures indicate the volume and page number of the previous article.*

| Years | Imports | Exports | Total Trade |
|---|---|---|---|
| 1910–1 | $3,560,939 | $2,908,391 | $6,469,330 |
| 1911–2 | 4,317,314 | 3,080,178 | 7,397,492 |
| 1912–3 | 5,132,679 | 3,180,968 | 8,313,647 |
| 1913–4 | 6,624,930 | 3,421,331 | 10,046,261 |
| 1914–5 | 5,874,797 | 3,457,847 | 9,332,644 |
| 1915–6 | 4,452,109 | 4,190,565 | 8,642,674 |
| 1916–7 | 6,293,162 | 5,353,452 | 11,646,614 |
| 1917–8 | 4,784,449 | 4,586,931 | 9,371,380 |
| 1918–9 | 6,931,376 | 5,997,741 | 12,929,117 |
| 1919–20 | 12,860,762 | 6,944,725 | 19,805,487 |

(H. I. P.)

**HOOD, HORACE LAMBERT ALEXANDER** (1870–1916), British naval officer, was born in London Oct. 2 1870, the third son of the 4th Viscount Hood and a lineal descendant of the 1st viscount, Adml. Sir Samuel Hood, captor of Corsica in 1793 (*see* 13.665). He entered the navy in 1883, won many prizes, and was promoted lieutenant in 1890. He saw service on the Nile (1897–8), being in consequence promoted commander. In 1903 he was promoted captain and served in the Somaliland expedition (1903–4), being awarded the D.S.O. (1904). He commanded a small squadron of battle cruisers in the battle of Jutland (May 31 1916) and went down on his flagship "Invincible."

**HOOKER, SIR JOSEPH DALTON** (1817–1911), English botanist (*see* 13.671), died at Sunningdale, Berks., Dec. 10 1911.

**HOOVER, HERBERT CLARK** (1874– ), American mining engineer and public official, was born of Quaker parentage on a farm at West Branch, Ia., Aug. 10 1874. He was left an orphan at an early age, his mother dying in 1880 and his father four years later. When 14 years old he ran away from a relative's farm in Oregon and went to Portland where he worked in a real-estate office. When Leland Stanford, Jr., University was opened in 1891 he entered with the first class and specialized in geology and engineering, supporting himself by working at various jobs in free hours. On graduating in 1895 he worked for a time at a California mine to get experience. Then he went to San Francisco and secured employment in the office of a mining engineer. In 1897 he went to Australia as mining engineer for an English syndicate and developed successful mines. In 1899, when a Department of Mines was created by the Chinese Government, he was appointed Director-General of Mines. Before departing for the Orient, he married Miss Lou Henry, a fellow student at college, daughter of a banker at Monterey, Cal. In China he made extensive surveys which, however, were interrupted by the Boxer outbreak; and he, together with his wife, was among those besieged at Tientsin. After his return to America he had other offers from abroad, and thereafter was engaged in mining development throughout the world. From 1902 to 1908 he was a partner in the firm of Bewick, Moreing & Co., London, for whom he had gone to Australia in 1897. Later he was connected with several mining companies, with offices in London, and there he was when the World War broke out in 1914.

At that time thousands of Americans in Europe found their funds shut off, and Mr. Hoover headed a committee in London to give all possible assistance to those in England. The sudden invasion of Belgium by the Germans rendered a large part of the Belgian civilian population destitute, and on Oct. 22 1914 the Commission for Relief in Belgium was organized and Mr. Hoover appointed chairman. All his energies were now directed to securing food and vessels for its transportation and to directing its distribution in Belgium. This involved constant contact with officials of the warring countries, especially those of Germany, but he soon showed that the work was entirely neutral. Later the Commission's activities were extended to devastated northern France. After America's entrance into the World War the work had to be carried on by neutrals, but Mr. Hoover remained chairman of the Commission. Some idea of the business efficiency of the C.R.B., as it was familiarly called, may be gained from the fact that although almost $1,000,000,000 was expended on food and transportation, only about one-half of one per cent was required for overhead expenses. In Aug. 1917 he was appointed Federal Food Administrator. Already as chairman of the food section of the Council of National Defense he had begun to marshal all the agencies for economizing, especially on those foods which the Allies needed. He reached every American household by enlisting the services of the women. He instituted wheatless days and meatless days, and urged the avoidance of all waste. After the Armistice, 1918, his services were extended to the destitute populations of central Europe. Storehouses of food were established at various centres and a system of food-drafts was devised whereby relatives and friends could send relief where it was needed. In 1920 Mr. Hoover was mentioned as a possible candidate for president. He himself declared that he did not desire nomination, but later agreed to take the Republican nomination if it should be offered him. The party machine, however, did not give him any support. It was declared that he had long lived in England, and in only one case (1896) had he been able to vote for a presidential candidate. Throughout he kept up his work of relief, and at the beginning of 1921 was collecting funds as chairman of the European Relief Council, for the starving children of central Europe. In March he entered the Cabinet of President Harding as Secretary of Commerce, stipulating that he be allowed to carry out his European relief work, already begun. In the autumn of 1921 he undertook the general supervision of relief work in Russia, first having exacted, as a condition, the release of all American prisoners held by the Soviet authorities.

He was the author of *Principles of Mining* (1909), based on lectures given at Stanford and at Columbia universities. In 1912, in collaboration with his wife, he published as a sumptuous folio, with reproductions of the illustrations of the first edition (1556), an English translation of Agricola's *De Re Metallica*. This Latin treatise on mining and metallurgy had remained the standard text-book for almost 200 years after its appearance; the translation, with introduction, annotations, and appendices, was a pious memorial to a pioneer contributor to the knowledge of a great profession. (G. C. S.)

**HOPE-HAWKINS, SIR ANTHONY** (1863– ), English novelist (*see* 13.682), was knighted in 1918. His later novels include *Mrs. Maxon Protests* (1911); *A Young Man's Year* (1915); *Captain Dieppe* (1918); *Beaumaroy Home from the Wars* (1919) and *Lucinda* (1920).

**HORNE, CHARLES SYLVESTER** (1865–1914), English Nonconformist divine, was born at Cuckfield, Sus., April 15 1865. He was educated at Newport grammar school and Glasgow University, and subsequently studied theology at Mansfield College, Oxford, becoming minister of Kensington Congregational chapel in 1889. In 1892 he married the daughter of Lord Cozens-Hardy, afterwards Master of the Rolls. He was chairman of the London Congregational Union in 1902, and in 1903 became minister of Whitefield's chapel, Tottenham Court Road. In 1910 he was elected Liberal M.P. for Ipswich. He died suddenly while on a visit to America, May 1 1914.

See *Life*, by W. B. Selbie (1920).

**HORNE, HENRY SINCLAIR HORNE,** 1ST BARON, (1861– ), British general, was born Feb. 1 1861. He joined the Royal Artillery in 1880 and served on the staff throughout the South African War, taking part in Lord Roberts' advance from Cape Colony through the Orange Free State into the Transvaal and in various later operations, for which he was made a brevet lieutenant-colonel. He was promoted colonel in 1906, and from 1910–2 was staff officer for artillery at Aldershot; he then became inspector of artillery, and in Aug. 1914 he went to France in command of the artillery of the I. Army Corps.

He was promoted major-general for distinguished service in Oct. 1914, and in the following Jan. was given charge of the 2nd Division, which position he filled until Nov., when he went out to the Near East with Lord Kitchener. At the end of the year he was given charge of the XV. Army Corps in Egypt and he took this to France in April 1916 and commanded it during the opening phases of the battle of the Somme. His method of employing his guns during these operations attracted much attention and was signally successful, as was recognized by his being given the K.C.B. and by his being chosen in Sept. to succeed Sir C. Monro as leader of the I. Army. He was promoted lieutenant-general at the beginning of 1917, and his troops achieved very marked success during the fighting that took

place about Arras and Lens in the spring. They took no part in the Flanders offensive later in the year, but when the enemy in March and April 1918 made his great effort they repulsed all attacks that were made upon their front. Then, when the Allies' counter-offensive developed in the late summer, their part in the final victories was conspicuous. For his services he was at the beginning of 1919 advanced to the rank of full general and on the final distribution of honours he was raised to the peerage as Baron Horne of Stirkoke and received a grant of £30,000.

**HORNE, SIR ROBERT STEVENSON** (1871– ), British politician, was born at Slamannan Manse, Stirlingshire, Feb. 28 1871. He was educated at George Watson's College, Edinburgh, and at the university of Glasgow, where in 1893 he took first-class honours in philosophy. In 1895 he became lecturer in philosophy in the University College of North Wales, and from 1896 to 1900 was examiner in philosophy at Aberdeen University. In 1896 he was called to the Scottish bar. In 1910 he became a K.C., and stood unsuccessfully as Conservative candidate for Stirlingshire in both the general elections of that year. He joined the Royal Engineers on the outbreak of war, and in 1917 became assistant inspector-general of transportation. The same year he was made director of the Admiralty department of materials and priority. In 1918 he was elected for the Hillhead division of Glasgow, and became director of the Admiralty labour department, being also made third civil lord of the Admiralty and created K.B.E. In 1919 he became Minister of Labour. He presided over the National Industrial Conference of Feb. and April 1919. In 1920 he became president of the Board of Trade, and received the G.B.E. In 1921 he was appointed Chancellor of the Exchequer in succession to Mr. Austen Chamberlain.

**HORSLEY, SIR VICTOR ALEXANDER HADEN** (1857–1916), English surgeon, was born at Kensington April 14 1857, the son of the painter John Callcott Horsley. He was educated at Cranbrook school, and afterwards studied medicine at University College hospital, where he took his degrees in medicine and surgery in 1878 and 1880. He soon won a reputation as a gifted and successful surgeon, and on the brain in particular he did work of extraordinary brilliance. In 1886 he became surgeon to the National Hospital for Paralysis and Epilepsy, from 1884 to 1890 was superintendent of the Brown Institute at Lambeth, in 1885 secretary to the Royal Commission on Hydrophobia, and from 1891 to 1893 Fullerian professor at the Royal Institution. From 1893 to 1896 he was professor of pathology at University College, in 1902 he was knighted, and in 1906 became emeritus professor of surgery at University College hospital. In March 1916 he volunteered for service in Mesopotamia. He was sent up country, and died of heat stroke at Amara July 16 1916. Sir Victor Horsley was keenly interested in social questions, an ardent advocate of temperance and a strong supporter of woman suffrage. He unsuccessfully contested the university of London as a Liberal in Dec. 1910, and in 1912 came forward as candidate for Market Harborough. Here, however, he received no official support, and retired. He received honours and awards from many universities and scientific societies, and was first chairman of the representative meeting of the British Medical Association.

See *Life* by Stephen Paget (1920).

**HORTHY DE NAGYBANYA, NIKOLAUS** (1868– ), Regent of Hungary in 1920–1, formerly an Austro-Hungarian naval officer, was born on June 18 1868 of a Hungarian family of Calvinist gentry. During the World War he distinguished himself, as captain of the battleship "Novara," by raids on the Italians in the Adriatic. He was adjutant to the Emperor-King Charles, and as Admiral and Commander of the Fleet he surrendered, at the Imperial command, the Austro-Hungarian fleet to the Jugoslavs when Austria collapsed. During the rule of the Soviet in Budapest he organized in Szeged the counter-revolutionary troops, at whose head he marched to Budapest after the fall of the Soviet republic on Nov. 16 1919, and took over the supreme military command in Hungary. As the exercise of the royal power by King Charles IV. was interrupted during the revolutions and on account of foreign complications, Adml. Horthy was, under Article 1 of the law of Jan. 1 1920, elected regent on March 1 1920. This highest position in Hungary he was to occupy indefinitely until otherwise directed by the National Assembly (*see* HUNGARY).

**HORTON, ROBERT FORMAN** (1855– ), British Nonconformist divine (*see* 13.783), published his *Autobiography* in 1917.

**HOSPITALS** (*see* 13.791).—GREAT BRITAIN.—During 1910–20, and especially late in that decade, the problem of voluntary hospitals became gradually more acute. Considerable confusion had arisen in the minds of many people by 1921 as to the relative value of the various remedies that had periodically been suggested. Some of these suggested remedies had not received general approval because they failed to meet the situation as a whole; some were obviously devised to meet the pressing needs of an individual hospital heedless of the effect on other similar institutions, while other so-called cures were but attempts to remove some individual symptom. In other words, treatment has often been prescribed prior to the diagnosis of the disease. In order adequately to appreciate in broad outline the hospital problem as it presented itself in 1921 in Great Britain, it is necessary to consider its various aspects.

*The Principle of Management.*—There are three ways in which British general hospitals can be managed: they may be (*a*) controlled by the State; (*b*) controlled by the local municipality (county or borough councils); or (*c*) continued on the so-called voluntary basis, as at present.

The advocates of a State hospital service occasionally cite the excellent attainments of the military hospitals during the World War in support of their argument; but it should be pointed out that, although such hospitals were State institutions in so far as they were staffed and financed by the State, their success was in no small measure contributed to by the great volume of voluntary aid supplied in the form of personal service at the central hospitals as well as in the auxiliary institutions, which proved such a valuable adjunct to the military hospital system. The question of municipal control of the general hospitals of the country was discussed in Parliament and in the public press in 1920 in connexion with the Miscellaneous Provisions of Health Bill introduced by the Minister of Health, with the result that it soon became apparent how widespread was the opposition to the possibility of any such contingency. The opposition appeared to crystallize round the idea that the general hospitals would thus be brought into close proximity to, and therefore likely to be influenced by, the fluctuating tides of local politics. With possibly a preponderating vote for Labour in one area, and in another the controlling vote in favour of a policy for the reduction of local rates, the obvious result would be a disparity in the amount of hospital provision and in efficiency of management even greater than exists at present throughout the country. In the bill referred to, as originally introduced, the Minister of Health asked Parliament for powers to enable the county and borough councils (1) to supply and maintain hospitals, including out-patients' departments for the treatment of illnesses; (2) to contribute on such terms and conditions as the Minister may approve to any voluntary hospital or similar institution within their area. The Minister of Health repeatedly announced his desire to maintain the voluntary hospitals on their existing basis, but in asking for such wide powers in his bill he roused the opposition of many who read more into the bill than the minister really intended.

Although the bill never reached the Statute Book, it will doubtless be regarded by the hospital historian as having been the means of the voluntary hospital system making a real step forward, for out of the discussion on the bill came the establishment of the committee presided over by Visct. Cave, a body appointed by the Minister of Health "to consider the present financial position of voluntary hospitals and to make recommendations as to any action which should be taken to assist them." The appointment of this committee met with widespread approval, for all genuinely interested in British hospitals realize that the first essential step prior to any legislation is to investigate the evidence from the country as a whole and thus ascertain the existing "facts" from which to evolve some solution of the present problem. The Cave Committee was appointed on Jan. 25

1921, and on March 9 an interim report was published which contains the following important announcement:—

"The evidence already received has convinced us that it is desirable in the public interest to maintain the voluntary system of hospital management."

Such an important pronouncement by a body of independent investigators could hardly fail to exercise considerable influence in stabilizing public opinion and to encourage that large body who by their voluntary contributions have hitherto been the mainstay of a hospital system which is regarded as unique in the history of charitable institutions. The Cave Committee recommended that a State grant of £1,000,000 should be made in relief of hospital finance, but in June 1921 the Government decided to make this only £500,000, the condition being that further voluntary effort should be made in order to keep the hospitals on an independent basis.

*Hospital Finance.*—Whoever seeks to investigate this aspect of the British hospital problem as a whole quickly encounters difficulties which may well appear almost insuperable. King Edward's Hospital Fund for London makes it conditional for any hospital applying for a grant that the uniform system of accounts be used, with the result that it is a comparatively simple problem to obtain a clear statement of the finances of any individual hospital, or of the group as a whole, in the London area which comes under the supervision of the King's Fund. But there is no supervising authority for the hospitals outside London, with the result that in the provinces, in Scotland and in Ireland the voluntary hospitals adopt a bewildering variety of forms for presentation of their financial accounts. This lack of uniformity makes it exceedingly difficult to ascertain the real financial position of many individual hospitals, and almost impossible to institute a reliable basis of comparison for the hospitals in the aggregate. Owing to the absence of a uniform system of hospital accounting, the annual hospital report is of little value for comparative purposes. The annual report as at present constituted is a production for "home consumption," that is, for the individual hospital committee, and is useful in comparing the costs of one year with another, but is of comparatively little value for the purposes of an inter-hospital comparison, and unless hospitals are in a position to compare themselves with similar institutions, they are apt to remain isolated units without the privilege of learning from the good points of their neighbours.

A reform urgently needed, not only for the provincial hospitals but also for those under the supervision of the King's Fund, is some simplified system for showing a hospital's financial situation, so that the subscribing public might readily understand the position of the institution they are asked to support. It is no longer enough for a hospital secretary to publish the bald statement on the front page of the annual report that such and such a sum of money is urgently needed to keep the hospital going. A hospital financial statement should set forth the total amount of money received during the year from all sources, from individual sources, and details of what has been done with the money received.

Prior to and during the World War the voluntary hospitals as a general rule experienced no great difficulty in obtaining financial support sufficient to meet their expenditure. Voluntary subscriptions and donations constituted the major portion of the receipts. Certainly during the years 1915–8 inclusive, when so many hospital beds were occupied by patients paid for on a capitation basis by the State, the majority of hospitals were able to show an ever-expanding income. But when this financial prop was removed during 1919 hospitals were caught unprepared.

When the military patients disappeared their places were speedily taken by non-paying patients. Hospitals had recourse to their old pre-war method of raising money, namely the spasmodic public appeal, only to find that such methods no longer possessed the necessary power of earlier days. The result was that hospital secretaries appealed through the public press for the support necessary to stave off the threatening financial disaster. But during this period, while so many were declaring their helplessness, several hospital secretaries took stock of the new conditions, realizing, amongst other facts, that the possession of money, as a result of the war, was more widespread amongst the community. They appreciated the fact that their hospital patients were drawn from a class of the community who were now, and had been during the war, in receipt of much higher wages than formerly, and to these employees in factories and workshops the hospital secretaries appealed for weekly contributions and organized the necessary machinery for collection. This source of revenue has proved most profitable to many hospitals, but unfortunately there are some hospital secretaries who appear reluctant to explore this source of wealth that is so ready to their hand.

In 1919, a period before workmen's contributions had been generally adopted by the hospitals, it was found that, out of 600 hospitals (in the provinces) investigated, 374 showed contributions from employees amounting in the aggregate to £518,043, or approximately 20% of their ordinary income.

Again, many hospitals realized that there were those amongst their in-patients who were no longer content to place a small coin in the hospital poor-box in gratitude for the services received, but who now desired to pay a more substantial contribution towards their expenses, so that in 1921 the majority of the hospitals had in operation one of three possible methods by which patients' payments are made:—(*a*) Many hospitals had adopted the almoner system, that is, specially appointed hospital employees who approach the individual patient who comes to hospital, explain the needs of the hospital, and invite the patient to contribute according to his ability. (*b*) A few hospitals had adopted the less popular plan of instituting a fixed daily or weekly levy from their patients on account of maintenance. (*c*) Comparatively few hospitals in 1921 were without the reserve of a small number of beds for patients who desired to pay the cost of their maintenance. Many of the small or cottage hospitals in the provinces had instituted the system of paying-patients some years before, but there were still some of the larger type of hospitals that had made no such arrangements. The London hospitals were quickly adopting some system of patients' payments, as shown by the following figures. In 1913 the amount obtained from payments made by or for patients was £78,000. In 1919 it was £124,000—an increase in the six years of £46,000—whereas in 1920 the total from this one source reached £230,000; and if patients' donations are included the total reached was £260,000—an increase of £182,000 in the seven-year period. In the provinces in 1919, 600 hospitals with 33,514 available beds showed a total ordinary income, including un-earmarked legacies, of £3,486,098. Payments made by or on behalf of patients amounted to £803,741, or 23% of the total ordinary income. It has to be pointed out that these figures being for 1919 include some figures that may be regarded as non-recurrent—namely, capitation payments for the military patients who were then remaining in hospital. The question of "paying-patients" in voluntary hospitals was repeatedly urged by that great hospital authority the late Sir Henry Burdett, who pleaded with the hospitals to adopt the principle not only as a relief to hospital finance but as broadening the basis of usefulness to the community.

The following figures, supplied by the Cleveland Hospitals Survey are from three large American general hospitals and show the ratio of paying to non-paying patients:—

| | Percentage of Total Admissions. | | |
|---|---|---|---|
| | Hospital I. | Hospital II. | Hospital III. |
| Patients paying full cost of maintenance . . . | 41·9 | 27·9 | 30·5 |
| Patients paying part cost of maintenance . . . | 20·8 | 40·9 | 49·3 |
| Patients paying nothing towards maintenance . . | 30·1 | 15·5 | 20·2 |
| Patients unclassified . . | 7·2 | 15·7 | 0·0 |
| | 100 | 100 | 100 |

Of the various other possible sources of hospital income in England there is one that calls for special comment—namely, payment on behalf of National Insurance patients. The section of the National Insurance Act dealing with medical benefit does not make provision for the payment of hospital treatment. The operation of the Act has thrown an unexpected volume of work upon the voluntary hospitals, both in the in-patient and out-patient departments. This fact, with all the expense involved to the hospitals, was rather obscured during the six years of the war period because of the necessary pressure in making provision for the treatment of military patients and also because hospitals were in receipt of enhanced incomes from the War Office; but after these conditions had disappeared the hospitals realized the great pressure that the operation of this Act placed on their finances. Medical men who act as panel practitioners continued to recommend their panel patients to the hospitals in increasing numbers and for these the hospitals received no direct payment. Hospitals had some claim for financial consideration for the treatment of patients under the National Insurance Act. Such payment should not take the form of a capitation rate, as such rates would inevitably tend to rise and have the effect of drying up income from voluntary sources and also probably in time necessitate some degree of State control over the hospitals on behalf of the approved societies. Any payment for insured patients might rather take the form of block grants to hospitals, administered through a central hospitals board, after careful assessment of the general work of the hospitals, especially in regard to the standard of service and also of the efficiency of administration.

In discussing the disposal of the accumulated surplus, estimated at approximately £7,000,000, Lord Cave's Committee in their interim report made the following statement:—

"We are strongly of opinion that, in the interests both of the hospitals and of the societies, the schemes to be approved should provide for the application of a substantial part of the disposable surplus in providing a contribution towards the cost of the maintenance of members in hospitals."

*Hospital Expenditure.*—Too often the superficial view is taken that what is known as "the hospital problem" is merely a consideration of finding the additional income that is required. On the

contrary, another aspect of the problem of equal if not greater importance is the question of hospital expenditure. In times past, when hospitals received from the subscribing public whatever income they chose to appeal for, there was not that incentive to exercise scientific check and control over expenditure that became urgent when income was so much more difficult to collect. This subject of hospital expenditure is pregnant with great possibilities for economy, provided there could be established the necessary supervising authority to carry out the investigations and the consequent recommendations. Intimate knowledge of both military and civil hospitals reveals one point of marked difference between the two types, greatly to the financial advantage of the former, namely—a coordinating authority. In the British military hospitals a system of comparative "returns" was instituted by the army medical department dealing with such items of expenditure as food, drugs and surgical dressings, laundry, personnel, etc. These "returns" were of two kinds: (*a*) intra-hospital, comparing ward with ward; and (*b*) inter-hospital, comparing individual hospitals with each other. The circulation of these "returns" exercised a silent pressure which resulted in an enormous reduction in expenditure. The good points of any one hospital were soon brought out in the circulating returns and became apparent for other hospitals to emulate. No such inter-hospital comparison existed amongst the voluntary hospitals: each hospital was an isolated unit, with little regard to any other hospital and learning few of the good points from its neighbours. It would be almost futile to set up any basis for stabilizing the financial position of hospitals without the necessary corollary of establishing some system of coördination. Hospitals themselves admit the necessity for something of the kind to be established, but so long as the spirit of individualism prevails there can be small prospect of any system of coordination being set up from within the hospitals themselves. It must be instituted by some body outside the hospitals having the power to render monetary assistance to the hospital. In the absence of coordination amongst the hospitals it is a fair deduction to say that the money subscribed by the public is not put to its best use, for there is not only considerable overlapping on the part of the hospitals in purchasing commodities—hospitals competing against one another in the same market, sometimes in the same town—but there is also overlapping of hospital accommodation.

In some parts of England there are more hospital beds than are required, while in other areas there are large waiting lists of patients which the hospitals are not overtaking. No one in 1921 had any authority to exercise influence over the hospitals so as to come to some arrangement by which the smaller hospitals might bring relief to the big hospitals by taking over some of the patients who suffer from less severe ailments. The large general hospitals are necessarily expensive institutions because of the special equipment and staff required, and when these hospitals become full and waiting lists develop, the hospital committees usually begin to think of means to extend their accommodation, or, in other words, *to enlarge the inlet* into the hospital; whereas a more practicable policy would be to evacuate their patients more rapidly into auxiliary institutions, such as the cottage hospitals in the surrounding country—in other words *to enlarge their exit*. Further, there is urgent need for some scientific scheme of training for hospital administrators. The standard of administration in 1921 varied within wide limits in the voluntary hospitals. The only experience some of the existing administrators had had was in office under the superintendence of their predecessor, and therefore they were apt to be content to attain to the standards of the past. Hospital administration has become an increasingly complex science, due partly to the ever-increasing specialization of the various departments. It is widely recognized that a carefully selected course of training is required for a woman to become an efficient almoner; so also the hospital treasurer has to be scientifically trained in the various branches of accountancy. But for the more responsible office of hospital administrator no special standard of training seems to be expected, nor is special training available.

A hospital is much more complex than most business organizations of equivalent size. Its peculiarity is the inclusion of a number of different professions, each highly specialized, which must work together and which must be kept in effective working relations. The basis of a hospital is its medical staff, but in addition to this medical element is the business administration represented by the superintendent and his administrative assistants. The nurses form another highly specialized and well-organized group. Social service (hospital almoners) represent still another and different type of work in the hospital; and there are, finally, the housekeeping, mechanical and clerical groups, who maintain the essential daily routine of the hospital. It should be added that while the emphasis of the work of most superintendents is on the business side, the superintendent ought to interpret, develop and represent all phases of a hospital's activity. Hospital personnel thus includes such widely varying elements and draws them into such intimate relationship that the successful organization and administration of a modern hospital is a difficult matter requiring special training and skill.

In America this problem of the training and equipment of hospital administrators has also been experienced, and a committee has been established, under the auspices of the Rockefeller Foundation, to report upon "the need and practicability of inaugurating a course of training for hospital executives."

*Available Bed Accommodation.*—"Hospitals represent, or ought to represent, the organization of medical services upon a scientific basis, bringing to bear upon the needs of the individual patient the maximum resources in equipment and skill that 20th-century medical science can muster. To promote a better understanding of hospitals by the community is to promote at the same time their better and more discriminating utilization and their more effective and generous support." This quotation from the Cleveland Hospitals Survey briefly expresses the ideal service that hospitals offer to the community. The British public have become educated during recent years to appreciate the valuable medical and surgical services now provided in general and special hospitals, hence the ever-increasing demands made by patients seeking to avail themselves of the best that medical science can give. These scientific developments within the hospitals, on the one hand, and the appreciation of them by the public on the other, disclosed a situation that called for investigation and reform—namely, the failure of hospital accommodation to keep pace with the demands. At the beginning of the 20th century the generally accepted hospital bed rate was one bed per 1,000 population, but that ratio was no longer maintained in 1921, for, as in the case of general housing of the people so with the housing of the sick in hospital, the supply of hospital accommodation had fallen in arrears in many districts since the time at which the hospitals were erected. The number of hospitals that can show "waiting" lists of patients seeking admission is too large for this aspect of the hospital problem to be ignored. Many hospitals have of recent years become so accustomed to the waiting-list problem that we are liable to overlook the fact that such lists imply a considerable amount of preventable human suffering, especially in the case of patients with haemorrhoids and hernia, and yet these diseases are responsible for the majority of the names on a waiting list. Further, some hospitals keep no record of the number of cases that have been refused admission owing to lack of accommodation. A hospital committee of management ought to be furnished each month by its superintendent or officer in charge with a statement showing the number, sex and age of each applicant for hospital accommodation that was refused admission and the reasons for the rejection. Such a procedure would educate those responsible for the good government of the voluntary hospitals to appreciate to what extent their institution was meeting the needs of the community.

But it is not only in regard to accommodation for patients in hospital that consideration is required, but also in regard to the accommodation for staff. With the reduction of nurses' hours on duty and consequently the increased number who have to be employed to overtake the work of the hospital, many hospitals have found their accommodation for staff inadequate. This was in 1921 one of the most pressing problems before many hospitals.

Hospital accommodation, whether for patients or staff, is obviously closely dependent on finance, and the financial position of these hospitals in 1921 was such as to put hospital extension entirely out of the question. In the London group of hospitals these financial difficulties regarding capital expenditure on increased accommodation were being experienced, as elsewhere. In the interim report by the Policy Committee of King Edward's Hospital Fund for London, dated April 12 1921, referring to increase of hospital accommodation, the following statement occurs:—

"In spite of the large sums already subscribed by the public, it is evident that the financial problem of making provision for even the most urgent development of hospital accommodation is a serious one; and the possibility of saving capital expenditure by making use of any existing buildings, whether at present under voluntary management or not, requires the fullest consideration, including, for example, the question of homes of recovery and the question of unused beds in Poor-Law infirmaries."

*Hospital Standards.*—No investigation of the hospital problem would be complete without some reference to the question of hospital standards. Any reference to standardization in connexion with hospital work is apt to convey, to those who are satisfied with a superficial view, the suggestion that this implies interference with initiative and the substitution of mechanical limitations.

On the contrary, some voluntary hospitals fail to function to their highest capacity because of the absence of definitely accepted standards. When a minimum standard of efficiency is defined, below which no hospital should be allowed to fall, there is no implication that any hospital should rest content on this minimum line; but the public have a right to expect that some accepted standard is maintained. Necessity exists for a generally accepted hospital standard in regard to two subjects—namely, hospital accounting and the training and equipping of hospital superintendents. In respect of the former some standard of uniformity is required before hospitals can be adequately compared with one another. This does not necessarily imply interference in any individual hospital with the system of book-keeping that may have been evolved to meet local requirements, but in addition to that the hospital should, for the purpose of an inter-hospital comparison, conform to some uniform system of accounts. Again, it has been pointed out how essential it is that some standard of efficiency in training should be expected from any applicant for the post of hospital administrator.

*Nurses' Training.*—Another hospital service that requires a minimum standard to be fixed is that of nursing, both as regards

training of the individual nurse and also the ratio of nursing personnel to hospital beds. A general hospital with a minimum of 50 beds may be sanctioned as an authorized school of training for nurses with permission to grant to the successful candidate a certificate of proficiency. It is well known that the standard of hospital training of a nurse varies widely in different hospitals, depending very largely on the requirements of the individual matron. In some hospitals the standard required of the nurse is very high; it may be even too high, calling for the comment from competent judges that a nurse's training should be restricted to nursing matters and not trespass into the domain of the medical man; while in other hospitals the standard of training is very much lower. Both sets of nurses "qualify" and issue from their respective training schools into the service of the public, each possessing her certificate of proficiency. The public have no means of judging as to the quality of the training of the nurses they seek to employ beyond the general label that "she is a certificated nurse."

The probationer nurses receive technical lectures from the matron and her senior assistants and from members of the junior medical staff of the hospital. Unfortunately there are too many hospitals to-day where the same individuals who give the tuition constitute the examining body, whereas in the larger hospitals one or more "external" examiners are appointed to share in the examination of the candidates. It is surely obvious that in such an important profession as nursing there might have been evolved ere this some definite minimum standard of proficiency applicable to all training schools. Again, it is not suggested that hospitals be asked to conform to some rigid mould of training, but in the interest of nurses themselves, and especially of the general public, some minimum standard should be fixed below which no hospital should fall.

A parallel illustration might be quoted in the final examination of the medical student, for it was only after the General Medical Council instituted a system of inspection of the various "final" examinations held throughout the country that something approaching a minimum standard of proficiency was adopted. Further, in regard to the ratio of nurses to beds, hospitals show a considerable range of difference, even after making due allowance for the variety in architectural structure of the buildings. The absence of any standard in this connexion makes it very difficult to institute a comparison between similar hospitals and renders of little value the figure quoted by hospitals as being the "cost per bed," for it is obvious that if one hospital employs more staff than its neighbours, the cost of provisions consumed by them but attributed to the patients will be higher, and so also with salaries and wages.

In conclusion, it may be stated that there is practically no department in a general hospital where some basis could not be arrived at for instituting standards of efficiency. Such standards would be of considerable value to the hospitals themselves and also to the general public, both in regard to economical administration and in the general service to the community; but owing to the want of knowledge of each other, hospitals at present lack the information that would be of so great value in the establishment of standards. This knowledge would readily be forthcoming under a system of hospital coördination, and the institution of some such system seems the most essential step towards a solution of the present-day hospital problem. (N. B.)

## United States

The hospitals of the United States in the years 1910–21 grew in number and made progress in the acquirement of national characteristics and fixed economic and social importance. In 1921 there were in the United States 7,667 hospitals maintaining 695,698 beds; in addition 24,304 beds were used for hospital purposes in homes for aged and in similar institutions. Table I. presents an analysis of these hospitals.

Table I.
U.S. Hospitals.

| Public: supported by taxation. | | | | Private: supported by earnings, endowments and contributions. | |
|---|---|---|---|---|---|
| Federal, State, County, Municipal. | | | | | |
| Proprietary, for profit. | | Voluntary Corporations not for profit. | | Hospitals for special groups maintained by | |
| Small hospitals for patients of one proprietor—a physician or surgeon. | Larger institutions for patients of a group of owners. | Church | Non-Sectarian. (Covering the larger endowed general hospitals, including those connected with universities.) | Fraternal Orders. | Large Industrial Plants. |
| | | Catholic. Protestant. | | | |

The proprietary hospitals show a much larger proportion of the total number of hospitals than of the total number of hospital beds, as most proprietary institutions have less than thirty beds. Larger proprietary institutions are divided into two classes. Some are jointly owned by two or more physicians or surgeons who combine to gain the increased facilities and efficiency obtained by pooling the volume of their professional business. Others are controlled by specialists corresponding to the departments of a general hospital—including X-ray and all forms of laboratory work. This was a recent development and the number of such hospitals was in 1921 few, but they showed great efficiency. The numbers will increase and in 1921 there was evidence that the basic idea—commonly called "group practice"—was bettering the professional service in other hospitals.

The hospitals in 1921 were classified by capacity as follows:

| Bed Capacity | Hospitals | Percentage |
|---|---|---|
| Under 25 | 3,110 | 40·56 |
| 25 to 49 | 1,859 | 24·24 |
| 50 to 99 | 1,263 | 16·47 |
| 100 to 199 | 781 | 10·19 |
| 200 to 499 | 405 | 5·28 |
| 500 to 999 | 116 | 1·52 |
| 1,000 and over | 133 | 1·74 |
| | 7,667 | 100·00 |

In discussing the number of active hospital beds (exclusive of convalescent and allied institutions and hospitals for nervous or mental diseases) needed by a given population, the figures for

Table II.—*Hospitals and Active Hospital Beds by States, and Ratio of Beds to Population.*

| States | Hospitals | Beds | Ratio of Beds to Pop. |
|---|---|---|---|
| Alabama | 84 | 4,214 | 1 to 557 |
| Arkansas | 58 | 3,147 | 1 to 556 |

Boston and for Massachusetts usually are cited as standard for a city and a state, New York's requirements being considered exceptional. Boston has one bed for each 110 inhabitants and Massachusetts one for each 165, and these never seem too many—indeed, scarcely enough. But the Boston hospitals admittedly draw some patients from other states.

Students of public health and welfare have agreed that any city must have at least one active bed for each 200 of population to meet its obvious obligations and that any state should have one bed for from 200 to 300 depending on the density of the rural population and its proportion to the urban population.

Table II. on the previous page shows conditions in 1921, convalescent and allied institutions and all hospitals for the nervous or insane being excluded.

*Classification.*—Two thirds of the hospitals in the United States in 1921 were classified as general, one-third as special, *i.e.* confining their work to tuberculosis, general contagious, mental and nervous diseases, maternity, etc. Nearly all limited their admissions to acute cases, with the result that the lack of provision for chronic cases was the prominent defect.

*Finances.*—The rapid increase in operating costs following the outbreak of the World War was a serious problem to American hospitals. Nearly all hospitals in 1921 admitted three classes of patients: (*a*) those paying full cost of their care; (*b*) those paying part of the cost in definite charges; (*c*) those paying nothing. "Pay" hospitals adjusted themselves to the new conditions by increasing their charges; "part pay" hospitals were generally able to obtain larger rates from patients during the war. Until deflation began there were fewer free patients than before the World War. This circumstance, the increase of (and the payment received from the Federal Government for) soldier patients, enabled the hospitals to meet their increased costs.

Answers to a general questionnaire in 1921 showed the actual investment in buildings and original equipment to average $4,714 per bed, no allowance being made for subsequent increases in values of land or buildings. On this basis the first cost of building and equipping the American hospitals had been $3,279,520,372. Annual maintenance cost for 1920 was $791 per bed. This figure, applied to the entire field, shows a total annual operating cost of $550,287,118. The above figures were compiled by the *Modern Hospital* with the aid of various agencies and organizations.

*Equipment.*—During 1910–20 there was a marked change in the equipment of the average hospital. The previous development in clinical and pathological laboratory facilities and work continued and expanded. An institution in 1921 had little claim to rating as a hospital unless it had a working X-ray equipment and was prepared to carry out any pathological and clinical laboratory work, including serological examinations, at least to the extent of the Wasserman test. To do this many institutions were compelled to make working arrangements with private firms or with other institutions, but the essential aim—that of making the service available to the patients in the hospitals—was secured. The average mechanical equipment also was much improved.

*Medical Education in Hospitals.*—The Council on Medical Education and Hospitals of the American Medical Association was in 1921 making a real contribution to the professional work of hospitals, as well as developing the fifth or intern year of medical education, by establishing a routine inspection of the hospitals' facilities and personnel for the instruction of the interns. Lists of approved hospitals were published and were of great service, as there were more positions for interns than new graduates in medicine, and a hospital was forced to comply with the requirements for admission to the approved list in order to obtain interns.

*New Hospitals.*—There was a distinct movement in the decade 1910–20 to make hospital service available to everyone. State legislation enabling rural counties with small populations to combine for the support of one hospital, and encouraging average counties without hospitals to erect and support one, was responsible for the larger part of the increase. Such county hospitals have their work supplemented through private endowment or gift and admit the private patients of the physicians in the county. The need for free service in some counties is very small. The hospital is often in type a community institution quite different from the county hospital in a large county having many private hospitals. In these large counties the county hospital provides largely for free or chronic patients and often acts as a department of public service for the poor.

*Organization.*—The American Hospital Association has both institutional members (hospitals) and personnel members, such as hospital trustees, persons on the medical staff, superintendents and department heads. State associations similarly organized were being formed rapidly in 1921 as state sections of the American Hospital Association. There was also a Catholic Hospital Association. There were many National associations of the nurses, social workers and dietitians. These were all united in the American Conference on Hospital Service, formed to deal with questions larger than those of any one of the associations. (A. R. W.)

**HOUGHTON, WILLIAM STANLEY** (1881–1913), English playwright, was born at Manchester Feb. 1881, and was educated at the Manchester grammar school. He became a cotton-broker, but employed his leisure in dramatic criticism for the *Manchester Guardian* and in the writing of plays. *The Dear Departed* was produced by Miss Horniman in Manchester in 1908 and afterwards in London. With *Hindle Wakes* (1912) he leapt into fame. It had a long run in London and later in the same year *The Younger Generation* (written and played in Manchester in 1910) was successfully produced at the Haymarket theatre, London, with *Trust the People* the following year at the Garrick and *The Perfect Cure* at the Apollo. His early death in Manchester Dec. 10 1913 cut short a career of much promise.

**HOURS OF LABOUR.**—The decade following 1910 witnessed a rapid advance and extension in the already widespread movement in favour of the reduction of the hours of labour. This was mainly due, apart from general trade-union pressure, firstly to the repercussions of the World War and of experience of industry under war conditions, and, secondly, to the international recognition of the principle of the 8-hour day in the Treaty of Peace of Versailles as one of the "principles . . . well fitted to guide the policy of the League of Nations."

Until the outbreak of the World War the movement in favour of the reduction of hours, and particularly in favour of the 8-hour day, had gone forward but only slowly and spasmodically. International conferences of workers passed the ordinary resolutions demanding the 8-hour day, as did the International Socialist Conference of 1910, the International Textile Workers' Conference in 1911 and the eighth Congress of Trade Union Secretaries in 1913. In 1912 the International Association for Labour Legislation asked for a 56-hour week for glass-workers, an 8-hour day for the iron and steel trades, for workers in paper and pulp mills and in the manufacture of chemicals. In the following year the Miners' International Congress demanded the day of eight hours "bank to bank." The official delegates of the Berne Conference in 1913 contented themselves with a proposal to limit the hours of child workers to 10 daily—a proposal which the International Association for Labour Legislation adopted in 1918, with the suggestion that part of the working day should be devoted to trade education. The Berne Conference further suggested a 10-hour day for women workers.

The comparatively moderate nature of the majority of these pre-war proposals—and indeed of certain later ones, such as that of the Congress of Inter-Allied Trade Unions at Leeds in 1916, which asked for the 10-hour day, and that of the International Trade Union Congress held at Berne in 1917, which demanded that the daily maximum should be gradually reduced to 8 hours—would hardly have prepared the student of these matters for the very striking advances which became operative in the chief industrial countries between the Armistice and 1921. The advance is also to be noted in recent expressions of trade union opinion, in the movement for the 7- and even for the 6-hour day in coal-mining, and in such pronouncements as that of so influential an employer as Lord Leverhulme in England, who in 1918 himself advocated the 6-hour day on economic grounds.

The outbreak of war had been followed in all the belligerent countries by the suspension of all limitations upon the hours of labour worked in industries of importance in the conduct of the war, whether these limitations arose from agreements with the trade unions, from legislation or from custom. In all cases the general course of events was the same. After some difficulty, varying in degree with the imminence of the threat to national safety and with the strength of trade unionism, the workers consented, were persuaded by tempting rates of wages, or were coerced to lengthen the working day. In all cases, after the experience of a period of excessively long hours, it was found that the returns from overtaxed labour rapidly diminished, and in all cases limitations were sooner or later re-imposed, not, however, reducing

hours to the pre-war standards, but calculated to yield the highest return in output from the personnel available.

War experience would thus seem to have effectively killed the long-lived notion that output in industry varies directly with the number of hours worked. The argument in favour of the shorter working day was indeed formidably (and perhaps unexpectedly in certain quarters) strengthened by the scientific investigation of hours in relation to output, which was undertaken, by Great Britain and America in particular, in the height of the desperate struggle to produce adequate supplies of munitions of war. The results of the British investigations, published in the various reports of the Health of Munition Workers Committee (appointed by the Ministry of Munitions in Sept. 1915) and of the British Association for the Advancement of Science, were of the highest scientific value, and these, corroborated by the evidence of American, French and German experience, and themselves corroborating much of the argument of certain investigators whose work had been done before the war, undoubtedly were an important factor in determining the attitude of mind which is reflected in the above quoted "principle" enshrined in the Treaty of Peace.

War experience did, in point of fact, supply the scientific basis which the general propaganda, carried on for so long by the organizations of workers in all industrial countries in favour of the reduction of hours, had lacked. Such scientific data as existed had been provided or interpreted for the most part by writers on so-called "scientific management" who were concerned primarily with questions of output. Governmental investigations had to consider output *in relation to the labour available*, and were led inevitably to considerations of the health of workers and even of their satisfaction or dissatisfaction. In other words, whilst previous investigations were, rightly or wrongly, suspected by workers generally to be directed by motives which, if not hostile, tended at least to a certain neglect of the workers' side of the case, the war investigations were much more widely accepted as being a fair attempt at an adequate study of the question of hours in relation not only to output but also to the effect on the worker.

It need only be added here that the general result of those investigations was that a reduction of hours was not incompatible with an increase in output, arising from the improved health of the worker and his increased capacity for effort during the shorter hours worked.

The war, however, was responsible for another and perhaps even more effective factor in the eventual restriction of hours. The repercussions of the successive Russian revolutions were everywhere felt and everywhere dreaded. It became a commonplace of polemic on the subject of improved conditions of labour that such improved conditions (including the reduction of the hours of labour) were the alternative to Bolshevism. Thus scientific experience, fear of revolutionary movements and the normal liberalism of the nations successful in the war were united in support of a general reduction in the hours of labour at the moment of relief and optimism which succeeded, in the later months of 1918, the long and oppressive years of warfare.

The results of this combination are to be found in the rapid extension of legal restrictions upon the hours of labour which took place in many of the belligerent countries immediately upon (or even before) the Armistice of Nov. 1918, and in the inclusion in the treaties of peace of the "Labour Part" (Part XIII. in the Treaty of Versailles) which creates machinery for international legislation upon labour conditions, and which recognizes the 8-hour day as an end to be pursued by international action.

In the middle of 1921 signs were indeed not lacking that a characteristic of the next few years might be a reaction in this connexion. Hopes of rapid recovery to the economic position of pre-war days had been disappointed, and there was a manifest tendency to place part of the blame for this upon the reduced hours of labour. It can only be noted here that this reaction seemed likely to result in a check to the movement for a further reduction in hours of labour.

### National Measures

National legislation for the limitation of the hours of labour has taken various forms. In some cases, *e.g.* France, Spain, Portugal, acts or decrees have prescribed a *general* limitation for all workers, or for all workers in large groups of occupations such as "industry," or "commerce," whilst the detailed application has been left to be elaborated by administrative decrees or orders. Usually these decrees are issued after consultation with the organized workers and employers concerned, and they appear to result in a considerable elasticity in the application of the law. In other cases (*e.g.* Netherlands, Czechoslovakia, Belgium) the act itself is made to apply to a detailed list of industries, and the exceptions are usually indicated. Again, as in the case of Great Britain (Coal Mines Act) a special Act may regulate the hours worked in a particular industry.

Another group of legislative measures deals with the hours of labour of specified classes of workers, women and children and men, engaged in hazardous occupations. In Great Britain the Factory Acts have attempted to regulate the hours of women and children, who were regarded as being less favourably situated for "free bargaining" than men, but it was not until 1908 that legal restrictions were placed upon the working hours of the latter, and then only in the case of a single industry, coal-mining, which was of a peculiarly difficult and laborious nature.

A third type of legislation secures the aim of limiting hours of labour by indirect means. In the Commonwealth of Australia, for example, and in its constituent states, the Arbitration Laws provide for the settlement of disputes in labour matters (including disputes about the hours of labour) by a process of arbitration and the legal enforcement of arbitration awards. Again, in the case of Germany and some other countries, collective agreements arrived at voluntarily between employers and workers' organizations may under certain conditions be given the force of law.

There remains to be noted the huge mass of collective agreement upon hours of labour which, though not always possessing the force of law, does in fact regulate hours very successfully in many countries. This is notably the method adopted for most industries in Great Britain, but the practice is common even in countries where legislative limits are enforced. In these cases the collective agreement is usually an advance, from the workers' point of view, upon the provisions of the existing legislation.

The analysis, given later, of the position in 1921 in the more important industrial countries of the world will illustrate these methods of limitation.

(*a*) *Exceptions of a General Nature.*—All national legislation on the subject of hours provides for exceptions of a general nature, affecting the whole field of application of the legislation, as well as for exceptions in particular cases.

To provide for the former class of exceptions, which may be classified as those arising from national necessity, clauses are usually inserted which give the administration power to suspend or relax temporarily the regulations normally in force. In the case of the draft International Convention (see later) it is provided that "the operation of the provisions of this Convention may be suspended in any country by the Government in the event of war or other emergency endangering the national safety" (Article 14). From national legislation the following may be cited:—"Extension of the working hours shall be permitted in cases of urgent public necessity, mobilization, fire, flood, landslips, explosion, grave disaster, in all cases of *force majeure* . . . " (Portugal; Decree of May 7 1919, limiting the hours of work in commercial and industrial establishments).

"His Majesty may, in the event of war, or of imminent national danger, or great emergency . . . by order in Council suspend the operation of this Act to such extent and for such period as may be named in the Order either as respects all coal mines or any class of coal mines" (Great Britain: Coal Mines Regulation Act, 1908).

(*b*) *Exceptions in Particular Cases.*—Experience of the working of national legislation has proved that *a priori* arguments against the possibility of a universal application of the 8-hour day—or even of a uniform day of greater length—were largely justified, and much elasticity has been conceded in the administration of hours of labour acts. Both national and international legislation has been obliged to provide for certain exceptions in particular cases, which may be classified as those which arise (1) from considerations of the *worker* himself or herself, (2) from the *size of the industrial undertaking*, (3) from the *nature of the work*, (4) from the *situation of the country concerned* with regard to climatic conditions, character of population, or other factor rendering it abnormal from an industrial point of view, and (5) from *exceptional circumstances*.

(1) In the first class may be placed those exceptions which are

provided for domestic industries and small establishments where only members of the same family are employed. The fact that exception is made for such cases is due to a recognition of the great difficulty of supervising the application of any regulations. So far, international labour legislation has admitted exceptional treatment for these classes of workers. It is generally considered, both in national and international legislation, that certain persons, even in factories where a minimum day is legally enforced, should be exempt from its provisions because of their relations to the employer. Managers and persons holding posts of responsibility or of confidence are generally thus exempt, and in some national legislation sons or other close relatives of the employer are similarly excluded from the application of the regulations. Again, in all countries which have adopted legislation on hours of labour, women and young persons are exceptionally treated.

(2) As to the *size of the industrial undertaking*, different standards have been adopted. Whilst in Sweden concerns employing not more than four workers are exempt from the application of the Eight-hour Act of 1919 (save where such concerns are situated in towns with a population of over 1,500), in Japan 15 is the number of employees requisite to bring an undertaking within the scope of the Factory Act, and in India it was 20 until 1921, when the number was reduced to ten. Here again the great difficulty is that of the inspection and supervision of small isolated concerns, but a complicating factor lies in their frequent close connexion with agriculture, which results in their sharing to some degree in the seasonal character of the latter. This reason appears to have been influential in deciding the attitude of the Swiss Government towards the International Convention on the 8-hour day and the 48-hour week.

(3) The third class of exceptions, it has been stated, are connected with the *nature of the work*. The case which appears to have presented most difficulty in national legislation is the *continuous process*. In many industries (*e.g.* iron and steel, paper, glass, gold-refining, etc.) processes are employed which take long periods for their completion, and which cannot be intermitted without damage to or total loss of the material operated upon. In such cases work is organized in shifts, frequently 3 shifts of 8 hours each per day, but also frequently 2 shifts of 12 hours. Whilst the former plan achieves the 8-hour day, it does not of itself achieve the 48-hour week (for work is continued through 7 days per week). A certain elasticity is required to facilitate changes of shift, which frequently results in a week of more than 48 hours alternating with a week or possibly two weeks of less than 48. In other cases the process, whilst not being continuous in the strict sense of the word, is yet longer than the normal working day of 8 hours. The arrangement of shifts for such cases presents further difficulties for which exceptions must be provided.

The International Convention on hours permits a 56-hour week in "those processes which are required by reason of the nature of the process to be carried on continuously by a succession of shifts."

The opposite case is where the work is of so *intermittent a nature* that it is felt that a longer day may be worked without injury to the worker. It is difficult to define exactly what is meant by this "intermittence." The work of a gatekeeper or watchman who has no other duties may be instanced, but there are border-line cases which are treated differently in different legislations. Is a railway porter's or a signalman's work intermittent? Obviously generalization is impossible. The Washington meeting of the International Labour Conference tried to meet such cases by permitting the legislative authorities to allow permanent exceptions where the work is "essentially intermittent," but insisting at the same time, first, that regulations, to be drawn up after consultation with the organizations of workers and employers concerned, should fix the maximum number of additional hours to be permitted, and, second, that the check of compulsory overtime pay at a rate of at least "time and a quarter" should be imposed to guard against any further overstepping of the bounds thus extended.

For national legislation the Netherlands Hours of Work and Dangerous Trades Act (Nov. 1 1919) may be quoted:—"Men who do no other work than that of watching may do such work during 10 hours a day and 60 hours a week. . . ." Section 25 (2b).

The Swiss Hours of Work on Railways Act similarly provides, in section 3 (2), "In the case of certain employments, specified in the Supplementary Regulations, which consist mainly in being in attendance at a given place, the average hours of work may be extended to nine hours." The Czechoslovakian law (Eight-Hours Act of 1918) makes similar extensions for "persons engaged in irregular service such as the supervision and watching of houses and undertakings, and looking after animals."

*Seasonal industries* form a further category under this heading. Both national and international legislation permit extension of the working day in industries engaged upon material susceptible of rapid deterioration, or material which is available at certain seasons only and which must be treated immediately. Similarly, industries dependent upon weather conditions are usually allowed considerable elasticity in the daily or weekly total of working hours. The Swedish Eight-hour Act (Oct. 17 1919) provides, *e.g.* that "if working hours are dependent in a material degree upon the seasons or the weather, or if they are of varying length by reason of these or any other conditions, the Labour Council may, to such extent as may be found necessary, authorize a system of working hours differing from that established in §4 (*i.e.* the 8 and 48 rule), provided that the aggregate working hours over a period not exceeding four weeks shall not in any case be more than the number of hours corresponding to 48 hours per week." This device of averaging the weekly hours over a period is fairly common, and has been adopted in international legislation. Article 5 of the Washington Draft Convention lays down that in exceptional cases where the ordinary rule cannot be applied, a Government may give the force of law to agreements between workers' and employers' organizations which permit an extension of the daily limit, provided that "the average number of hours worked per week, over the number of weeks covered by any such agreement, shall not exceed 48."

In the regulation of hours of labour in commerce, similar exceptions are frequently provided for hotels and restaurants at certain periods of the year. International legislation has so far not dealt with commerce, but with regard to seasonal industries similar proposals are made in the Washington Draft Convention to those outlined above in the case of "intermittent" work.

Exceptions are usually provided in connexion with what is known as "*preparatory and complementary*" work. There is frequently the necessity of the earlier attendance in factories of a certain number of the personnel whose work must be done before the general work can commence; there are others, similarly, who must continue after the conclusion of the general work. Cases in point are the engineers and other workers in the engine-room of a factory. In some national legislation, and in international legislation, exceptional provision is made for such workers; limitations are, however, usually laid down, as in the case of the Netherlands Hours of Work and Dangerous Trades Act of Nov. 1 1919, section 25 (2 a), which provides that "men and women who have to prepare workrooms, tools and appliances before the commencement of the day's work or who have to attend to them at the conclusion of the same may do such work . . . during not more than 10 hours a day, provided that women do not work more than 51 hours and men not more than 57 hours in a week. . . ."

(4) The fourth class of exceptions arises in international legislation, where it has been found necessary, in order to attempt a rough equation between countries dissimilarly situated with regard to climate, character of population or other industrial factor, to permit a longer working day in the one than in the other. Thus in the Washington Convention, a 57-hour (60 hours in the raw silk industry) week is permitted for Japan, and a 60-hour week for British India, and elasticity is provided in the application of the Convention to "colonies, protectorates and possessions not fully self-governing" for "such modifications as may be necessary to adapt its provisions to local conditions."

(5) The circumstances which, under national and international legislation, permit of the temporary suspension of the general application of the limitation of hours have already been treated. Some national legislations consider that the danger to an industry arising from the pressure of foreign competition is a sufficient warrant for the relaxation of rules in its particular case. Thus the Swiss Factory Act allows "a weekly duration of work of 52 hours if urgent reasons justify this measure, and so long as these urgent reasons hold good, particularly if . . . an industry runs the risk of being unable to withstand competition on account of the duration of work time in other countries" (Section 41). And an Article in the Swedish Act seems to have in view the same (among other) circumstances: "If the application of this Act involves such difficulties in the case of any particular work or undertaking as to jeopardize the continuance of the same, the King may . . . authorize an exemption from the application of this Act such as the circumstances may require."

### Principal Countries

United Kingdom.—The 8-hour day was established in the mining of coal, stratified ironstone, shale and fireclay by the Coal Mines Regulation Act of 1908, and the amending Act of 1919 further reduced the daily hours of underground workers, with certain exceptions, to seven. Article 1 of the Act provided for a future reduction in certain eventualities to six hours daily. Other legislative restrictions of hours are to be found in the Factory and Workshop Consolidation Act of 1901, the Shops Act of 1912, and the Employment and Closing Order Act of the same year. A bill was introduced in Aug. 1919 for the establishment of the 8-hour day in industry, and clauses were proposed to be added extending its scope to cover also maritime employment and agriculture, but it went no further in 1921.

In the United Kingdom legislation has played a comparatively unimportant part in the restriction of hours except in the cases of women and children. Before the war a large number of collective agreements had been made, and after the war these were widely extended. The spheres now (1921) covered by agreements re-

ducing the working week to 48 hours or less are best indicated by an enumeration of the cases in which a longer week is still worked.

In agriculture the normal weekly hours are 48 in winter and 50 in summer. These figures, however, do not in all probability indicate the number of hours actually worked. They are fixed under the Corn Production Act, and their principal value from the workers' point of view lies in the fact that hours worked in excess of 48 or 50 are paid for at overtime rates.

In constructional engineering an agreement has fixed the summer week at 49½ hours, the winter week at 44 (this arrangement does not infringe the rule of an average 48-hour week).

In the linen industry of North Ireland workers in the bleaching and dyeing branches work, by agreement, 49½ hours per week.

A 50-hour week is the rule in one or two smaller industries, such as the manufacture of picture-frame moulding, and type-founding. In the latter case, the workers agreed to work two hours per week (in addition to the normal 48) without pay, in return for which they enjoy an annual holiday on full pay.

In the rest of British industry the rule is the 48-hour week or less. On the railways the normal weekly limit is, by an agreement of Feb. 1 1919, fixed at 48 hours (47 hours in the railway workshops). The daily hours, however, may exceed eight, provided that the weekly total does not exceed 48. The 44-hour week is worked in the building industry generally, in some quarrying, as at Aberdeen, in the manufacture of thread (though not universally), in glove-making (women) and tie-making, by dock workers (except at Belfast where the hours are 46), in the manufacture of envelopes, office and other furniture (again not universally), in bakeries in Scotland, in the textile warehouses of London and the wholesale warehouses of Manchester, and in most concerns in the cocoa and chocolate industry. Apart from a few very exceptional cases (*e.g.* glass-blowing, where the hours are from 35 to 37 per week) and the kaolin quarries of Cornwall and Devon (42 hours per week), practically every other British industry of importance enough to be organized has a weekly limit lying between 44 and 48 hours.

AUSTRALIA.—The position as regards hours of labour is determined in Australia by (1) Factory and Shop Acts, (2) Early Closing Acts, (3) decisions of arbitration courts and boards, including those of the Federal Arbitration Court, (4) direct legislation such as the Mines Act of the various states, and (5) collective agreements. The 8-hour day (or less) and the 48-hour week (or less) are practically universal in industry and commerce.

The Factory Acts date from 1900 in Queensland (amended several times subsequently), 1904 in Western Australia (amended 1912), 1907 in South Australia (amended 1908, 1910 and 1915), 1910 and 1911 in Tasmania, 1912 in New South Wales and 1915 in Victoria. The principal Early Closing Acts are those of 1899, 1900, 1906, 1910 and 1915 in New South Wales, of 1911 and 1912 in South Australia, of 1902, 1904 (two Acts), 1911 and 1912 (a consolidating Act) in Western Australia, and of 1911 and 1913 in Tasmania. In addition to these New South Wales has an Eight-hours Act of 1916, amended 1920, and Acts of 1910 and 1916 relating to the Saturday half-holiday and Sunday rest. Each state has mining legislation regulating hours amongst other conditions of labour in mines. Generally speaking these provide that no underground worker and no surface worker whose duties are laborious or responsible shall work more than eight hours per day, and Sunday labour is prohibited.

Arbitration courts and boards were first created in 1912 in New South Wales, Queensland, South Australia and Western Australia. The Acts establishing them have been in some cases frequently amended, and the courts now figure very prominently in the regulation of hours and in the settlement of disputes. For example, in New South Wales the Industrial Arbitration Act of 1912 directs the Court and the Boards of Arbitration that their awards must, in the case of all industries other than the coal and metalliferous mining industries, provide for working hours not longer than (1) 8 hours per day on 6 consecutive days, (2) 48 hours per week, or 96 hours in 14 consecutive days. Again, in Nov. 1920 a decision of the Federal Arbitration Board awarded the 44-hour week to a large group of industries. In New South Wales the Eight-hour (Amendment) Act of 1920 established a special court to inquire into the working hours in any industry and to consider the possible economic effects on that industry of a reduction to 44 hours per week. On April 11 1921 this court reported in favour of the 44-hour week for a large number of groups of workers, including most of those employed in the building trades, in the manufacture of food and of furniture, in the iron trades and in printing. The decisions of the court were given effect by proclamations on April 16, and they came into force on May 1 1921, with the exception of that referring to the iron trade, which became effective from May 22. Again, in Victoria, decisions of the Arbitration Commission, issued on June 29 1916 fixed limits to the working day in practically all industries, usually but not universally at eight hours.

NEW ZEALAND.—The Factory Act of 1901, consolidated in 1908 and amended in 1910, fixed the working hours of men at 8¾ per day and 48 per week, of women and boys at 8¼ per day and 45 per week. Since then hours in most industries have been reduced to 8 per day and 48 or less per week by agreement or by awards of the Court of Arbitration. The 44-hour week is now the rule for brewers, bricklayers, electrical workers, employees in the manufacture of furniture, plasterers, stonemasons, tailoresses, wharf-labourers and some others. Bootmakers have a 45-hour week and typographers 42. In coal-mining a 5-day week is worked alternately with a 6-day week (8 hours daily "bank to bank") and in gold-mining the 44-hour week is the rule. In some cases the working day has been reduced to 7 (*e.g.* biograph operators) or 7½ (trackmen employed on tramways).

An amendment to the Shops and Offices Act which came into force on Jan. 1 1920 reduced the weekly total of working hours for shop assistants from 52 to 48, and permitted a maximum overtime of 100 hours per annum (not more than three hours in any one day).

CANADA.—Both collective agreements and legislation have been used in the limitation of the working day in Canada, with the result that the 48-hour week is the rule in mining, on railways, in the public utility services, the building industry, the manufacture of chemicals, tobacco, food-stuffs, paper and printing, textiles, in the oil industry, in shipbuilding, carriage building and in the metal trades (with some exceptions). Telegraphists secured the 8-hour day in 1920. British Columbia and Manitoba have legislated on the hours of women workers, and Nova Scotia on those of young persons, in each case imposing the 8 and 48 rule; in the Yukon Territory and Manitoba the same limit has been fixed by law for state employees. Alberta and British Columbia have enacted the 8-hour day in coal-mines and for furnace workers, British Columbia in metalliferous mines, and Ontario in all mining industries. The weekly hours of women workers in restaurants in Manitoba are limited to 48 by administrative order. In the other industries above mentioned the 8 and 48 limits have been secured by collective agreements.

Hours worked on Canadian railways appear to be governed largely by the practice in the United States, where the McAdoo Award gave the 8-hour day. The same rule applies to the electric tramways of British Columbia.

SOUTH AFRICA.—The hours of labour in factories are governed by the Factory Act (No. 25 of 1918) which laid down limits of 9½ hours daily and 50 hours weekly for adults, and a 45-hour week for young persons under 16 years of age. The Mines and Works Act (No. 12 of 1911) provides an 8-hour day and a 48-hour week for underground workers in gold-mines.

In addition to these legal limitations, hours are regulated by a number of collective agreements, particularly in the skilled trades. The surface workers in gold-mines and underground and other workers in coal and other mines have secured the 48-hour week by agreement. Certain categories of factory workers—the more highly skilled—have also been able to secure the 48-hour week though their working hours are legally restricted by the Factory Act.

FRANCE.—The 8-hour day in France began with certain employees of the State in 1901, and by 1914 it had been extended to about a third of the workers employed by the State. An inquiry made in 1906 showed that certain establishments in the chemical industries, in printing, textiles, metals and glass had adopted it, but in all only some 15,000 workers were concerned. In subsequent years the substitution of the 3- for the 2-shift system gave the 8-hour day to others, notably to furnace workers (1911), and to those engaged in the manufacture of artificial silk and aluminium. During the war the 8-hour shift was adopted in many munition establishments.

The Eight-hour Act of April 23 1919 laid down that "the effective working time of workpeople or employees of either sex and of any age shall not exceed 8 hours per day or 48 hours per week, or an equivalent limitation based upon a period of time other than the week, in industrial and commercial establishments or in business premises of any kind connected with them, whatever their nature, whether public or private, secular or religious, even where they are of a technical educational or religious nature." The application of the law was to be by administrative decrees. A considerable number of these, applying the Act usually to certain industries, have been issued. The one of Dec. 12 1919 in reference to the textile industries will serve as a type. It provides for the limitation of the working hours to a maximum of 8 per working day in each week, but allows the weekly total of 48 hours to be so distributed as to permit of a shorter working day on Saturdays. To achieve this, a maximum of 9 hours per day may be worked. In the bleaching, dyeing and finishing branches of the industry it is possible (since a short working day is uneconomic in these processes) to distribute the 48 hours over 5 days only, with a maximum of 10 hours per day. The decree goes on to make minute provision for the extension of hours to make up for lost time due to slackness of trade (for which a maximum of 100 additional hours per year may be worked), for exceptional pressure of work (maximum 150 additional hours), for the provision of rest periods and for the keeping of registers of the hours worked. Altogether some 30 groups of trades or categories of workers have been covered by similar orders, including the more important French industries (leather and skins, books, boots and slippers, clothing, building, metal trades, hats, electricity, carriage and coach building, saddlery, etc.) and some commercial undertakings (hotels and cafés in Paris, hairdressers' shops, etc.).

In addition to this legislative regulation, a number of other trades have secured the 8-hour day by collective agreement, some of them—the clothing workers, builders, textile workers in the

north, and others—before the application of the Act to their particular industry.

France is one of the few countries which has applied the 8-hour day to seamen. This was done by a decree of Feb. 24 1920.

ITALY.—A decree of May 15 1919 instituted the 8-hour day for workers on railways, trams and in inland waterways, and a second of June 15 1919 did the same for the State railways. Generally, however, reductions in hours of labour have been secured by collective agreements, which now cover practically every important industry, including transport and mining; for example, since April 1919 miners have worked a 7-hour day for the most part. The larger number of these collective agreements date from early in 1919. In their application the emphasis would appear to be upon the 48-hour week rather than the 8-hour day; as in France the working day is frequently extended by an hour or half-an-hour in order to permit of a shorter working day on Saturday. Most of the agreements limit the permissible number of hours which may be worked daily in excess of eight, usually to two.

GERMANY.—Regulations issued on Nov. 23 1918 respecting the hours of work of industrial workers, including those employed in transport, established the general 8-hour day. These were followed up rapidly by a series of amending orders regulating exceptional cases, and on Jan. 24 1919 by an order relating to a provisional Agricultural Labour Act, which was to give legal force to an agreement, concluded between agricultural employers and employees, regulating conditions in agriculture and prescribing an 8-hour daily average during four months of the year, a 10-hour average during four months, and an 11-hour average over the remaining four months. On the same date as that of the general order mentioned above, hours in baking and confectionery establishments were limited also to 8 daily.

The hours thus determined by legislation have, in certain cases, been still further reduced by agreement. For example, an agreement concluded between employers and workers on Jan. 22 1919 established the 8-hour day with a 6-hour Saturday for workers in the textile industry. This agreement was abandoned by the employers early in 1921, however, and new agreements have for the most part reëstablished the week of 48 hours.

The hours of work in mines were fixed by the regulations of Nov. 23 1918 at seven daily for underground workers, but later, in view of the economic position, the miners agreed to work an additional shift (seven hours) per week.

AUSTRIA.—The Act of Dec. 19 1918 (reënacted Dec. 17 1919 with some changes) provided that "the hours of work in industrial undertakings carried on as factories shall not exceed 8 hours in 24, not including breaks in work." The Act further limited the working hours of women and young persons to 44 in the week. Instructions issued on Feb. 12 1919 regulated the application of the Act in continuous industries, railways and other special cases.

An Act of April 3 1919 made similar provision for employees in bakeries, and working hours in mines were regulated by the Act of July 28 1919, which again established the 8-hour day, with possibilities of further reduction in particularly unhealthy places.

The 8-hour day was, however, established much earlier in some Austrian industries (*e.g.* lithography since 1914) by agreement, and has been extended to branches of industry not covered by the above Acts, *e.g.* woodworkers, by the same method. On March 1 1921 a 10-hour day in agriculture was instituted by collective agreement.

RUMANIA.—An administrative regulation of July 1 1919 instituted the 8-hour day in the national printing offices. The rule was extended to the State match and tobacco factories, railways and other State enterprises. Collective agreements secured the same end in the metal, carpentry and printing trades in Bucharest during the early months of 1919, and in the petroleum industry in Nov. of the same year. In one province (Ardeal) a Decree of May 21 1919 prescribed the 8-hour day in industry, mines and quarries, and in commercial establishments generally.

SPAIN.—Legislation on the 8-hour day in Spain commenced with the Royal Decree of March 11 1902, which applied to the employees of the Ministry of Finance. After the war, the same working day was extended by further decrees to building workers (March 15 1919), and to workers generally (April 3 1919—to come into force from Oct. 1 1919).

Regulations issued Oct. 9 1919 determined the hours to be worked at sea. The engine-room hands work an 8-hour day and 48-hour week at sea and in port; the hours of deck-hands vary with the size and nature of the vessel and its position. In the tropics the limit is 8 hours per day; elsewhere 10 or exceptionally 12.

Miners' hours were fixed by an Act of Dec. 27 1910 at 10 daily for surface workers and 9 for underground workers. The above-mentioned decree of April 3 1919 extended the 8-hour day to both categories. Subsequently, by an order of Oct. 10 1919, the hours of underground workers were reduced to 7, the reason given being that this was necessary in order that the surface workers should not be compelled to work more than eight.

Finally, an Eight-Hour Day Order of Jan. 15 1920 applied the Decree of April 3 1919 to workers generally, and specified the permissible exceptions. The only class of workers excepted by name from the application of this order are domestic servants, but a second order of the same date specifies many other classes, including agricultural workers engaged in the care of livestock, and hotel and restaurant waiters. In a large number of trades the 8 and 48 rule had been secured by collective agreement before the coming into force of the above royal decree and orders.

BELGIUM.—An Act passed on June 8 1921 established the 8 and 48 rule in industry generally, but from the end of 1919 it had been almost universally adopted, usually by agreement, as in diamond-cutting, bootmaking and the manufacture of musical instruments (June 2 1919), in quarries (April 17 1919), coal-mines (Dec. 1 1919): on Jan. 1 1920 furnace workers secured the 8-hour day, and on Jan. 1 1921 it was extended to bookbinders also. Most, though not all other industries were already covered before these dates, so that the Act recently passed made little actual difference in the situation beyond the change from agreement to legislation. The Act of June 8 provided further that the same or similar regulations should come into force within one year for commercial workers, including employees in retail shops, hotels, restaurants and public houses. A 7-hour day is already observed in some commercial establishments, particularly in Antwerp, but the working of overtime is fairly general.

NETHERLANDS.—An Act providing for the regulation of hours of labour and for the prohibition in certain cases of work in dangerous trades was adopted on Nov. 1 1919, and was put into force from Oct. 24 1920. Broadly speaking, the Act provided that the limit of hours of work in factories and workshops should be 8 in the day and 45 in the week; for outdoor employees of hotels, shops, offices, etc., 10 in the day and 55 in the week (with the possibility of a reduction in these hours by administrative regulations); for office workers indoors, 8 in the day and 45 in the week; for shop and pharmacy workers indoors 10 in the day and 55 in the week; for young persons employed in cafés and hotels, 9 hours in the day, and so forth. This is the most detailed and comprehensive hours-of-labour act in existence. A noteworthy feature is the 45-hour limit for the week's work. In establishing this, however, the Act did no more than sanction legislatively or re-affirm what had been already achieved in a large number of industries by collective agreement and by earlier legislation. In practice the 45-hour week means that the worker has Saturday afternoon free and that the "English week-end" is firmly established in the Netherlands. Since the passing of the Act collective agreements have tended to make the 8 and 45 rule even more general than does the Act itself.

The Act had not up to 1921 been applied to navigation, but by agreements barge and boatmen have secured a 10-hour day, and the engine-room staff on seagoing vessels the 8-hour day; the tendency is for collective agreements for maritime workers generally to be based on the 8-hour day and the "English week-end."

DENMARK.—The Factory Act of April 29 1913 was amended by an Act of Feb. 12 1919, which introduced the 8-hour day in undertakings working continuously day and night, for workers engaged on continuous processes. By decree the 8-hour day was subsequently extended to the State railways, posts and telegraphs and customs offices. The municipal authorities of Copenhagen and certain other of the larger towns have granted the same hours to their employees generally.

For the most part, however, reductions of hours in Denmark have been secured rather by the method of collective agreement than by legislation. One such agreement made on May 17 1919, and covering over 150,000 workers in several industries, established the 8 and 48 rule.

A Commission on Working Hours was appointed on Feb. 28 1919. Its report proposed the adoption of the 8 and 48 rule.

SWEDEN.—The Act of Oct. 17 1919 relating to the limitation of working hours, applies to "every undertaking, industrial or otherwise, in which more than four workers are ordinarily employed on account of an employer and also to every such undertaking carried on in any town or borough or municipality the population of which . . . exceeds 1,500, although the number of workers employed therein may be less than four." The Act imposes the 8 and 48 rule. A second Act regulates the hours during which work may be done in bakeries; generally speaking, it prohibits night and Sunday work.

An Act of Oct. 24 1919 limits the hours of seamen. The permitted hours vary with the size of the vessel and the nature and extent of its voyages. For engineers, greasers and trimmers on vessels carrying not less than 3 men of these categories the hours must not exceed 16 in 2 days, and similarly for firemen on vessels with engines of more than 250 H.P. engaged in ocean or North Sea trade, and on vessels of 600 H.P. or over in more restricted trade. For other seamen the 9-hour day is the general rule, though exceptions are permitted (up to 24 hours in two days) provided the weekly total does not exceed 63. On a vessel lying in port the limit is 8 hours daily (7 in the tropics).

NORWAY.—The Norwegian legislature adopted in Aug. 1918 an Act limiting the weekly hours of labour in industry to 48, with a daily maximum of 8½. Most industrial establishments, including mines, are covered by it, with the exception of those in which the number of employees is less than 5 and in which no motive power (of greater strength than 1 H.P.) is used.

An Act of July 11 1919 restricted the hours of seamen (deck-hands and engine-room staff) to 8 hours daily (7 in the tropics), and limited the hours during which the stewards, cooks and other

workers on board might be employed. Exceptions were admitted for small vessels, fishing vessels, and sailing vessels doing coasting voyages in the limits of Norwegian waters.

SWITZERLAND.—The principal Act regulating the hours of labour in Switzerland is the Factories Act of June 18 1914, which was amended by an Act of June 17 1919. The latter Act reduced the weekly hours to 48, providing at the same time for a working day longer than 8 hours in cases where a short Saturday is worked. Extensions to 52 hours are permissible if the Federal Council considers them warranted by "urgent necessity."

Hours of work on railways and other services connected with transport and communications (*i.e.* the Federal railways, postal, telegraph and telephone services, and transport and communication undertakings licensed by the State) are fixed by an Act of March 6 1920 at 8 per day averaged over 14 working days. This Act was the object of a referendum and was approved by a large majority.

In the Canton of Basle (Town) a local Act of April 8 1920 applies the 48-hour week in a general way to all employees in the public services and in private undertakings. For bakers and confectioners, gardeners, hairdressers, shop assistants and some others a weekly maximum of 51 hours is determined; for caretakers, messengers, cab-drivers, hotel employees and home workers it is 60 hours, and for chemists' assistants, theatre employees and "persons who work in the houses of private customers" 54. Domestic servants and agricultural workers are to be guaranteed an uninterrupted rest period of 9 hours in every 24. Other provisions regulate the working hours of young persons and children.

The 48-hour week has been very widely adopted in Switzerland, by virtue of the Act of 1919 and of numerous collective agreements which have regulated its application. Certain industries, *e.g.* lace-making and home-weaving, still, however, work longer hours, in the first case 52 (in 1914 it was 60), and in the latter, it is alleged, 10 to 12 hours per day.

For the building trades a scheme drawn up by a Special Commission appointed by the Federal Department of Public Economy was accepted in 1921. Under it the weekly hours will be 50 during the period March to Sept., 44½ in Oct. and Nov., and 39 otherwise.

GREECE.—A regulation issued on Feb. 14 1911 established the 8-hour day for underground workers in mines. By collective agreements the same rule holds in certain industries, especially in and near Athens and the Piraeus, and in State industries. Workers covered by these agreements include gasworkers, dockers, workers in the manufacture of macaroni, flour-millers, coopers, carpenters and ship cleaners. Greece was the first country to ratify the Washington international Draft Convention.

JAPAN.—Some limitation of working hours (the 12-hour day) was secured by the Japanese Factory Act of 1911, but the 8-hour day has only recently begun to be adopted. Since the war, however, this daily limit has been introduced in the shipbuilding industry and in the metal trades; it would appear, however, that the American plan of determining a "basic" 8-hour day has been adopted, rather than an actual limitation of hours. In some of the important glass works of Osaka, and in certain establishments in Tokyo, Kobe and Osaka, the 8-hour day is worked. Telephone workers in the central offices work a 7- or 8-hour day.

SOUTH AMERICA.—Either by national law or by agreement the 8-hour day for industry prevails generally in Argentina, Brazil, Chile, Peru, Ecuador and Uruguay. (H. A. G.*)

UNITED STATES.—In the United States regulations of hours worked in industry are made by state or Federal legislation or by agreement between employer and trade union. When trade unions fix the length of the working day, they mean the *basic* workday, with a higher rate of pay for overtime. The theory of the basic workday is that extra pay for overtime acts as a tax on the employer to induce him to introduce a shorter actual workday. In the week ending Dec. 13 1919, for the entire state of New York, 35·76% of telephone operators worked from 3 to 6 hours overtime, 35·02% worked 6 to 9 hours overtime.

According to the census of 1910, of the 6,615,046 wage-earners enumerated in manufacturing enterprises, 7·0% worked 48 hours or less a week, 30·6% worked 54 hours or less, 60·7% worked more than 54 hours but not more than 60 hours, and 8% worked more than 60 hours. The census shows that 114,118 or 1·7% worked where the prevailing hours were more than 72 a week. These figures, which do not include agriculture, building, mining, domestic and personal service, show the number of hours normally worked by the majority of workers in the establishments enumerated. Of the 86 principal manufacturing industries employing more than 10,000 wage-earners in 1909, 20 employed over 10% of their workers more than 60 hours a week.

Among railway employees continuous service for long hours has been very common. Records of the Interstate Commerce Commission show that during the year ending June 30 1913, 261,332 railway men were reported as on duty for periods exceeding the legal limit of 16 hours, and that over 33,000 of them worked more than 21 hours continuously. In 1914, of the 7,000,000 wage-earners enumerated in manufacture in the United States, 11·8% worked 48 hours a week or less, 51% worked 54 hours or less a week, 43·1% worked more than 54 hours but not more than 60 hours, and 5·8% worked more than 60 hours. The number working more than 72 hours was 0·8%. The number working the 8-hour day or less was 833,330, chiefly in the building trades.

The year 1915 was marked by an active movement toward the 8-hour day. Strikes for the basic 8-hour day started among the machinists in the war-boom town of Bridgeport, Conn., where they put the factories of the city practically on an 8-hour basis, and spread over the entire state and then into other states, especially Pennsylvania, New York, Ohio, Illinois and Massachusetts, and into other trades—munition industries, automobile factories, paper mills, musical instrument factories and garment trades. Over 200 firms, chiefly located in the eastern states, and among them the largest of their kind, granted the 8-hour day to their employees in 1915. Thirty thousand machinists in munition plants in Connecticut alone gained the 8-hour day. On Jan. 1 1915, about 7,000 members of the International Association of Machinists had the 8-hour day: by Jan. 1 1916, 60,000 had it. Of wage-earners in manufactures in the industries and localities studied by the Bureau of Labour Statistics in 1917, 171,978 gained the 8-hour day in 1915; 342,138 in 1916; 537,587 in the first 6 months of 1917. This leads to the conclusion that there were in the United States in June 1917, at least 1,885,033 wage-earners enjoying the 8-hour day. Probably in each case the basic 8-hour day is meant. The Anthracite Mine agreement of May 1916 established the basic 8-hour day with *pro rata* overtime pay for 6 days a week for all employees in the anthracite mines in place of the 9-hour day established by the 1902 agreement. The new agreement affected approximately 100,000 of the 181,899 workers reported in the anthracite mines in 1914, since the miners proper and their underground labourers, who together constitute about 40% of the total working force, were already working an 8-hour day schedule, and about 8,000 other employees were compelled by the nature of their duties to continue working 9 hours a day. In this case the basic 8 hours do not include the time going to and from employment, even on the premises of the mine; drivers must take their mules from the stables to the working place before the 8 hours begin, pay for such services to be included in the day rates.

What did more than anything else to bring the 8-hour movement to the attention of the general American public was the threatened strike of the railroad brotherhoods in the summer of 1916. As early as 1907 three of the brotherhoods in the western territory had demanded an 8-hour day, but they had abandoned this in favour of an increase in wages. In 1915 at the national conventions of the brotherhoods the question of the 8-hour day came up. Each convention instructed the executive officers to demand a basic 8-hour day, with pay at the rate of time-and-a-half for overtime. In Jan. 1916 the strike ballot was submitted to the vote of the men. In Feb., it was officially announced that 90% had voted in favour. The railroads were notified, and a reply requested. The two sides entered into negotiations, but in June the railroads refused the demands of the employees, and asked for arbitration under the Newlands Act or by the Interstate Commerce Commission. The brotherhoods rejected this, and voted to strike on Sept. 2. The country was frightened; it was at a time of crisis in international relations. The result was the President's message to Congress and the passage of the "Adamson Law."

The Adamson Law granted the basic 8-hour day to the members of the four railroad brotherhoods, at a rate of pay for the 8 hours equal to that previously for 10, and *pro rata* for overtime up to the legal 16 hours. The Act also provided for a commission to investigate the results of the change. The report of this commission was published in 1918. It shows that the greatest reduction in hours was among yard crews, 11,000 of whom were placed on 8-hour shifts between March and Oct. 1917. Passenger trainmen who were already often working 8 hours or less were little affected, while freight crews continued to have runs from 11 to 13 hours. In 1919 a general order of the Railroad Administration gave to the freight service the 8-hour day or 100-m. run as a basis with time-and-a-half pay for overtime.

After the entrance of the United States into the World War in April 1917 the number of employees working an 8-hour schedule was greatly increased because of the automatic regulation of the hours of labour on Government contract work by the Federal 8-hour law. By a series of executive orders the 8-hour day on Government ship-building, munitions, and construction work was suspended during the war emergency, and the basic 8-hour day with time-and-a-half pay for overtime was substituted. The influence of this on public opinion led to the introduction of the basic 8-hour day in private industries. About 25,000 boot and shoe workers secured the 50-hour week during 1917, about 11,000 cigar-makers gained

the 8-hour day. About 10,000 fur workers reduced their hours from 53 to 49 a week by strikes: in New York City about 5,000 of them secured an agreement establishing the basic 8-hour day. The United States Bureau of Labor Statistics reported in 1917 that the number of workers having the 8-hour day had increased 27% since 1914. Of the union scales in the metal trades in 1914, 28% provided for the 8-hour day, and 49% for the 54-hour week; in 1917, 41% provided for an 8-hour day, 32% for a 54-hour week.

In 1918, 50,000 lumbermen of the western states, 100,000 employees of the meat-packing industry, and about 336,000 shipyard employees and 270,000 employees of the merchant marine worked the basic 8-hour day with extra overtime pay, due largely to rulings of such Governmental boards as the Shipbuilding Labour Adjustment Board and the National War Labor Board, the general policy of which was to grant the basic 8-hour day, with time-and-a-half for overtime and double pay for Sundays and holidays. Shipbuilding employees of the Delaware river and Baltimore district were granted a basic 44-hour week with overtime pay up to a maximum of 60 hours. A decision of the War Labor Board introduced the actual 8-hour day, except in emergencies, in the foundries of Wheeling, W.Va. The reason given was that longer hours shorten the workers' lives, injure their health, and in the long run decrease production. In this case overtime was to be permitted only by the vote of a joint committee of employers and employees. For the railway shops, on the other hand, an agreement was made between the union and the Railroad Administration for all shops working single shifts of less than 70 hours a week to increase their hours on a 7-day basis, to meet the emergency of the war. On the day following the signing of the Armistice, the heads of the three chief production departments of the Government, War, Navy, and the Shipping Board, decided to issue an order for immediate discontinuance of overtime and Sunday work on all Government construction and in all establishments owned or controlled by the Government which were producing war supplies. An order of the Railroad Administration a week later provided that, wherever practicable, the hours which had been increased to meet emergencies in railway shops should be reduced to nine. Four awards of the War Labor Board in Oct. refused to permit overtime pay for Sunday work unless the employee had worked 48 hours in the preceding week.

The movement for the 8-hour day continued after the Armistice, until there was in 1921 scarcely a trade or industry in which many of the employees were not working the basic 8-hour day. Many of these work overtime. The Bureau of Labor Statistics in 1919 received reports of 1,640 agreements between trade unions and employers providing for the 48-hour week, and 315 providing for the 44-hour week. On Oct. 1 1918 the U.S. Steel Corporation granted the basic 8-hour day with time-and-a-half pay for overtime to the employees in its mines and industrial establishments, more than 250,000 men. A year later, the treasurer testified before the U.S. Senate Committee that of 60,000 employees of th's corporation and its subsidiary companies, 26·8% actually worked 72 hours or more a week, 38·7% worked 60 hours or more, and only 34·2% worked less than 60 hours a week. Most of these men work 7 days each week, 82 men work a continuous 24 hours once in each month, and 344 men work a continuous 18 hours every alternate week; these are all in blast furnace departments. However, some 20 American steel plants were in 1921 running on a 3-shift schedule; the employees affected have been willing to make concessions in the matter of wages, in order to obtain the shorter hours.

The year 1919 was marked by the introduction of the 44-hour week in the clothing industry, the result of strikes and peaceful agreements. The Postal Telegraph Co. reduced the hours of its employees to 8 a day. It indeed seemed that the 8-hour day was the "established policy of the country," as the President's personal mediation commission had stated. Twenty-seven unions, with a membership of 15,350, chiefly in the railway shops and building trades of Boston and Seattle, had a basic 40-hour week. In 1919 the International Typographical Union obtained the 44-hour week in book and job offices by negotiation with the employers; 12 years before, this Union together with the bookbinders and the pressmen, had spent $11,000,000 to win the 48-hour week.

Investigations made in 1920 showed that one-half the employees of hotels and about one-third of the men and one-fourth of the women working in restaurants were employed 7 days a week. Except for cooks the hours were very irregular, often split into shifts, and falling at different times day after day. The average hours on duty varied from 8 to 10 every 24. The basic work week in the Central Atlantic coast district for 40% of the unskilled labourers was over 54 hours, for 30% more than 44 but not more than 48 hours, for 18% it was 44 hours or less. Of skilled trades in the same district, 75% worked 44 hours or less a week; of clerical workers 12% worked 39 hours or less, 53% worked 39½ to 42 hours inclusive, 33% worked 42½ to 45 hours inclusive. There are no data for hours of agricultural labour for the United States as a whole. The length of the workday varies with the kind of farming and with the season. Studies made on Iowa farms (1909 to 1918) show that the average hours per weekday of the proprietor increased from 10·4 to 11·95, while those of the hired labourer decreased from 12·4 to 11·46. In Wisconsin in 1916 the average farm workday was 10·8 hours in winter and 12·5 in summer.

The annual convention of the American Federation of Labor in 1920 accepted the report of the committee on the shorter workday in favour of the 44-hour week, 8 hours for 5 days of the week, 4 hours on Saturday, except in certain industries where the hours should be still shorter, "that there may be no unemployment in that field."

Six states and the Federal Government have passed laws requiring that certain wage-earners be given one day's rest in seven. The Federal law applies only to post-office employees. Most of the laws limiting hours for women prevent Sunday work by fixing a weekly as well as a daily limit, but some specify only the daily limit, and Arizona makes the weekly limit 7 times the daily limit. Virginia requires that all state employees who work 7 days must be relieved for at least two Sundays in each calendar month. The 7-day week increases absenteeism, especially on Monday. Much of the present-day continuous operation of industry involves 7-day labour. In Minnesota in 1909, 98,558 men, or approximately 14% of the gainfully employed males in that state, were working every day in the week. In New York in 1910, out of 335,000 union members in a number of specified industries, more than 10% worked 7 days in the week. Many establishments which operate continuously, such as iron and steel plants, paper mills, glass and chemical works, combine the 12-hour day with the 7-day week, and in not a few cases require their employees to alternate weekly or fortnightly between day and night shifts, working 24 hours without rest when the change is made. Telephone operators in New York State receive 150% pay for the first Sunday on duty each month, and 200% pay for additional Sundays: the amount of Sunday work varies with the locality from every other Sunday to one in every fifteen.

While more than a dozen states have made Saturday afternoon a legal holiday, few, if any, have made effective provision for the enforcement of this or other laws fixing legal holidays. The extension of the Saturday half-holiday during recent years has been due to the initiative of the employer or to trade-union activity. The short workday on Saturday is more often found in summer than in winter, and more often among clerical and mercantile than among industrial workers. In 1914 the Consumers' League induced most of the large stores in New York City to close all day Saturday during July and August. In the summer of 1920, 25 of the largest department stores in the city closed all day on Saturday during July and Aug., and nearly as many for half the day. This was found actually to pay, as the number of shoppers in summer was small on Saturdays. In smaller communities stores closed Wednesday or Thursday. This movement of a regular weekday holiday in summer seems to

[1] Varies greatly with locality. No general averages attempted.

be growing. In Hudson river towns in the summer of 1920, factories employing less than 50 people were found to shut down on Saturday at 12 or 1 o'clock. In the building trades and clothing industry the 44-hour week is prevalent. Twenty-five per cent of the telephone operators in New York State have the 44-hour week.

The best known studies in the United States are reported in Goldmark's *Fatigue and Efficiency*, which is the collection of material used in preparing the brief for the shorter workday for women, in the famous case of Bunting v. Oregon, 37 Sup. Ct. 435, 1917, and in *U.S. Public Health Service Bulletin, No. 106*. Other references on hours of labour are the series of bulletins on the subject published by the U.S. Bureau of Labor Statistics, reports appearing in the *Monthly Labor Reviews* of the Bureau and reports of the National Industrial Conference Board. (J. R. Co.)

### International Action

Demands for international agreement or legislation on the standardizing of the hours of labour have been frequent since 1890, when the International Conference on Labour in Factories and Mines—the Conference summoned officially by the then German Emperor—suggested a general adoption of the 8-hour day in mines. The need for uniformity in hours in order to remove at least one awkward cause of friction in international relations was voiced in 1893 at Zurich by the Metal Workers' Congress, and again in 1904 at Amsterdam. In 1894 it was the turn of the Tobacco Workers; in 1905 of the International Conference of Trade Union Secretaries. At Geneva in 1906, and again at Zurich in 1912 the International Association for Labour Legislation emphasized the same point. In 1916 the General Federation of Trade Unions of Great Britain, and in 1918 the United States Socialist party adopted resolutions on the subject. Steps were taken in the same direction by the Scandinavian and Inter-Allied Conferences of 1918.

This movement culminated in the inclusion of the international labour agreement (*see* International Labour) in the Peace Treaty of Versailles. The Labour part of the Treaty was drafted by an International Commission on Labour Legislation, appointed by the Peace Conference on Jan. 31 1919. Its chairman, Samuel Gompers, of the American Federation of Labor, submitted a declaration of the aims of labour, which included the following clause:—

"It shall be declared that the workday in industry and commerce shall not exceed eight hours per day except in case of extraordinary emergency, such as danger to life or property."

Various national delegations proposed amendments in the terms, but finally certain "principles" were adopted by the Commission, including the following:—

"The adoption of an eight hours' day or a forty-eight hours' week as the standard to be aimed at where it has not already been attained."

The Peace Conference approved of these general principles in its plenary sitting of April 28 1919. An International Organizing Committee, representative of the United States, Great Britain, France, Italy, Japan, Belgium and Switzerland, appointed to prepare for the first session of the International Labour Conference created by the Labour part of the Treaty, placed first upon the Agenda for that Conference the question: "Application of principle of the eight hours' day and of the forty-eight hours' week."

*Working Hours in Industry.*—On May 10 1919 the Organizing Committee issued to the Governments of all the States which were named in the Annexe to the Covenant of the League of Nations a questionnaire, the object of which was, firstly, to secure information as to how far the 8-hour day was already observed, whether as a result of legal enactment, collective agreement, or custom; and as to the immediate intentions (if any) of the various Governments in the matter; and secondly, to elicit by categorical questions the attitude of the Governments towards the proposed limitation of the working day to 8 hours and the working week to 48.

Thirty-five Governments replied to the questionnaire. To the categorical question: "Is the Government prepared to adopt the limit of eight hours a day exclusive of rest-time?" not one Government returned a definitely negative reply. The Government of Siam did not contemplate legislative action "in the present circumstances." In the United States and Canada the distribution of legislative power between the central and state or provincial authorities made a direct reply difficult if not impossible. The Japanese Government doubted the possibility of the immediate application in Japan of the 8-hour day, in view of the relatively unadvanced state of most of her industries and the inexperience of her workers. Similar considerations were argued by India and by Greece. Every other State replying to the questionnaire indicated its readiness to adopt the 8 and 48-hour limits. Many of them indicated that these limits (or lower ones, as in the case of Poland, which had a 46-hour week) were already enforced within their territories.

The list of these States comprised every Power of industrial importance, with the exception of Russia, Finland and the ex-enemy States, and included Argentina, Belgium, Czechoslovakia, Denmark, Ecuador, France, Great Britain, Guatemala, the Netherlands, New Zealand, Nicaragua, Norway, Poland, Portugal, Panama, Peru, Rumania, Serbia, Spain, Sweden, Switzerland and Uruguay, in addition to those mentioned above.

Of the States which were not consulted or which did not reply, it was known at the time that Finland, Germany, German-Austria and Russia had already taken action by law.

This evidence pointed clearly to the possibility of the successful conclusion of an International Convention on the subject; and the Organizing Committee proceeded at once to the drafting of a project to be submitted for the consideration of the Conference. The basis of this project was the adoption of the 48-hour week rather than the 8-hour day, the Committee giving as its reason for this, that "it allows more elasticity in the arrangement of the hours of work, and it facilitates the adoption of a half-holiday, or even a whole holiday, on Saturday or some other day of the week, by enabling a longer period than 8 hours to be worked on other days. Secondly, it helps to secure the weekly rest-day, whereas the principle of an 8-hour day by itself does not." The greater part of the project was concerned with the limitations within which exceptions to the general rule should be permitted. It was clearly undesirable to leave unlimited scope for exceptions. "The mere affirmation of the principle of a 48-hour week, while leaving a wide discretion to each State to allow such exceptions as it considers desirable in the circumstances of its country, would not, so it seems to the Committee, fulfil the purpose for which the International Labour Organization has been created." Since one of the motives of such a convention, as indeed of all international labour legislation, is the removal so far as possible of such sources of international friction as those which arise from the competition of "cheap" labour, or of labour suffering under relatively disadvantageous conditions, the Committee was obviously adopting the proper attitude in this respect.

The discussions of the International Labour Conference, which met at Washington in Oct.–Nov. 1919, turned for the most part on the permissible exceptions. To the general principle little or no opposition was offered. The Organizing Committee's project was, after some preliminary discussion, referred to a Commission of the Conference, and a Special Countries Commission was entrusted with the task of considering the application of this and other projects to tropical lands and countries displaying unusual conditions.

The Commission on Hours amended the draft in several particulars, and clauses were added to meet the special cases of Japan (a 57-hour week); British India (a 60-hour week, with a clause indicating that further limitation of hours is to be considered at a future session of the Conference); China, Persia and Siam (consideration at a future session); Greece (postponement of the date at which the provisions of the Convention should come into operation for two years in the case of certain industries, three years in the case of others); and Rumania (postponement for three years).

The Organizing Committee's omission of a provision for the establishment of the 8-hour day was not upheld by the Conference, which approved, in the final draft, the wording:—

"The working hours of persons employed in any public or private industrial undertaking or in any branch thereof . . . shall not

exceed eight in the day and forty-eight in the week with the exceptions hereinafter provided for."

The draft Convention came before the Conference for its final vote on Nov. 28 1919 and secured the two-thirds majority which is necessary for the formal adoption of a draft Convention.

The authentic text of the draft Convention was communicated to the Governments of all States Members of the International Labour Organization by the Secretary-General of the League of Nations on jan. 15 1920.

Since a large number of the industrial States had already adopted, by legal enactment, or otherwise, the 8-hour day, it might have been expected that the ratification of the draft Convention would be rapid and practically universal. But this was not the case. Up to Aug. 1921 two countries only, Greece and Rumania, had ratified. Some countries (*e.g.* Great Britain and Switzerland) had definitely declined to ratify.

In the first place, certain difficulties arose as to the interpretation of those articles of the Treaty which govern the action to be taken by States in connection with the draft Convention. Article 405 of the Treaty of Peace provided that " Each of the members undertakes that it will, within the period of one year at most from the closing of the session of the Conference, or if it is impossible owing to exceptional circumstances to do so within the period of one year, then at the earliest practicable moment, and in no case later than eighteen months from the closing of the session of the Conference, bring the recommendation or draft Convention before the authority or authorities within whose competence the matter lies, for the enactment of legislation or other action." The wording of the last sentence has given rise to certain hesitation, but the bulk of the States members have construed " the authority or authorities within whose competence the matter lies " to mean their respective Parliaments, and have submitted the draft Convention together with the Governmental proposals for action upon it, to those bodies. In Great Britain the difficulty arose from the fact that Article 405 provides also that draft Conventions be submitted " for ratification by the Members." It was contended that the ratifying authority in Great Britain is the Crown, and that the Government was therefore under no obligation to submit a draft Convention for the consideration of Parliament unless legislative action in pursuance of the provisions of the draft Convention was contemplated.

Secondly, difficulties arose in connexion with the actual procedure of ratification. The Treaty provides an apparently simple formula:—

" In the case of a draft Convention the Member will, if it obtains the consent of the authority or authorities within whose competence the matter lies, communicate the formal ratification of the Convention to the Secretary-General. . . ."

But this procedure was, in certain cases, found to fit awkwardly into the complicated framework of the older diplomatic practice. France considered it necessary to sign with Belgium a convention embodying the terms of the draft Convention on hours, and to add a protocol which was left open for the signature of other States. France and Belgium may thus in some sort be said to have ratified the Hours Convention, though they did not complete the procedure laid down in the Treaty. But the act of France and Belgium led to some misgiving on the part of other states members of the organization, who naturally asked whether these two countries would consider themselves bound not only in respect of one another and of any other countries which might adhere to the Franco-Belgian convention by signing the open protocol, but also in respect of other States which might ratify the Washington Convention by the procedure indicated.

Thirdly, the exceptions provided for in the text of the Hours Convention did not appear to meet the circumstances of all countries. Thus, Switzerland, which had adopted the 8-hour day on its railways and in certain branches of industry, and which, in its reply to the Organizing Committee's questionnaire, stated that " The Government prefers the 48-hour week system and is prepared to adopt this limit in factories," declared itself unable to ratify the Hours Convention, principally on the ground that it considered its application to the small trades and undertakings of the rural and mountain districts to be undesirable. Again, Sweden, whose Government was " prepared to adopt both limitations (*i.e.*, the 8-hour day and 48-hour week) at the same time," was faced by similar difficulties. The British Government was " prepared to adopt the limit of 48 hours a week exclusive of rest-time." In Great Britain the 8-hour day and 48-hour week (or less) are all but universal. Yet the Minister of Labour declared that the Government was unable to ratify because of existing collective agreements governing the working of the railways, which permit overtime in certain cases which are not provided for in the Convention. The same or similar circumstances delayed or prevented ratification by Denmark, Holland, Norway and possibly other States.

Other factors making for non-ratification were the disturbed economic state of post-war Europe, and a reaction both in Government circles and in public opinion, as to the wisdom of shorter hours of labour in view of the need for greater production. The failure of the Russian revolutionaries to establish a satisfactory social system, the crushing of the attempts of their sympathizers in Hungary and Germany, and the failure of great strike movements in France, Great Britain and elsewhere, had moderated the fears of revolutionary action which were a factor in the creation of the International Labour Organization in 1919.

*Working Hours at Sea.*—The Washington Draft Convention was applicable to " industrial undertakings " which were defined partly by enumeration and partly by exclusion. The line of demarcation between industry on the one hand and commerce and agriculture on the other was left to be drawn by the individual States, and the whole question of the application of the 8 and 48 rule to maritime and inland navigation was deferred for the consideration of a special meeting of the Conference. The preparations for this meeting were made by the International Labour Office. Questionnaires were sent to the States members of the International Labour Organization, in order to establish the existing position with regard to the hours of labour worked at sea and on inland waterways, and to elicit the views of the Governments as to the establishment in these spheres of the 8 and 48 rule.

The principal maritime countries replied unanimously in favour of international regulation of the hours of labour on board ship, but in most cases with considerable caution with regard to the 8 and 48 rule, which is clearly more difficult of application under sea conditions. On the whole, however, the evidence was again in favour of the possibility of the conclusion of a Convention upon the subject, and the International Labour Office, basing its work upon the replies of the Governments to its questionnaire, elaborated a draft for submission to the Conference.

The second meeting of the Conference took place at Genoa, June 15–July 10 1920. The delegates attending it, whether representing Governments, employers' organizations or workers' associations, were predominantly men experienced in maritime administration or practice. But the result was indecisive. The draft prepared by the International Labour Office was referred as at Washington, to a special commission, and after being amended it was submitted to the full Conference, which approved it by a vote of 48 to 25; the two-thirds majority necessary for formal adoption thus was not attained, though by a very narrow margin.

The questions of the hours of labour in the fishing industry and in inland navigation were dealt with separately by the Conference. In both cases a recommendation was agreed upon, by the terms of which the States members were urged to adopt legislation limiting in the direction of the 8-hour day and 48-hour week the duration of the labour concerned. (H. A. G.*)

**HOUSE, EDWARD MANDELL** (1858– ), American politician, was born at Houston, Tex., July 26 1858. He was educated at the Hopkins grammar school, New Haven, Conn., and at Cornell University (A.B. 1877). He returned to Texas, where he became interested in politics. He never sought office, but as a trusted adviser he became influential in the Democratic party. He became a friend of President Wilson, with whose political ideals he sympathized, and after the outbreak of the World War in 1914 visited the belligerent countries as the President's personal representative, conferring with the leading diplomats informally and advising American ambassadors of the President's attitude on various questions. He himself repeatedly declared that he was not a peace envoy. In 1915 and in 1916 he was again in Europe observing conditions and from time to time making confidential reports to the President. This method of approaching foreign Governments through private personal contact instead of stereotyped diplomatic formality brought

some criticism upon the President, many believing that the powers of the recognized head of the State Department were being infringed upon. In 1917 he was elected a director of the Fort Worth (Tex.) *Record*. After America's entrance into the World War in 1917 Col. House was appointed to gather information which the U.S. peace representatives would need when the terms of peace should ultimately be discussed. He represented the United States at the Inter-Allied Conference in Paris, Nov. 1917. In Dec. of the same year he represented the United States in the Supreme War Council at Versailles. In 1918 he was delegated by the President to act for the United States in negotiating the Armistice and was a member of the American Peace Commission. He took a prominent part in drafting the Peace Treaty in 1919. In 1920 he joined the staff of the Philadelphia *Public Ledger*, and visited Europe as a correspondent of that paper.

**HOUSING** (*see* 13.814).—Subsequently to 1910 the housing problem greatly increased in difficulty. At that time it was largely a problem of the poorer classes, of slums, of congestion in cities and large industrial centres, and the like. In 1921 it reached even to the middle classes. There was a world shortage of houses. In addition the slum difficulties remained, and a great many houses had fallen into serious disrepair since 1914 owing to the World War.

There were no reliable statistics up to June 1921 on the shortage, though better information was likely to become available as the result of the taking of the 1921 census in England and elsewhere. However, there was no doubt on the general question. Almost every responsible Government of the world was confronted with a grave housing problem. There was abundant evidence of the crying need for houses which prevailed not in Europe alone, but in the remoter continents. A shortage of houses existed simultaneously in towns as far from each other as Paris, Cape Town, Bagdad, Melbourne and Bombay.

Such expedients as the compulsory registration of empty rooms, the erection of wooden hutments, and the conversion of large dwellings into small ones had been introduced, whilst in Germany the unpopular measures of rationing house room, and of billeting the civilian population in private houses, had been urged upon local authorities by the Government.

In several countries laws had been passed for the purpose of making grants of money from public funds towards building costs; of extending the power of local authorities in the matter of housing; of securing the observance of proper standards in the building of small dwellings; and of remedying the evil housing conditions prevailing in so many large and prosperous towns. Legislation had also been passed for the restraint of rent profiteering, to which the shortage of houses had given encouragement, whilst in France, the United States, Germany and Norway, special rent committees had been formed whose duty it was to reconcile, as far as possible, the claims of landlords and tenants.

In carrying out legislative measures and housing schemes misunderstandings had tended to arise between the authorities and the public, because progress was slow at a time when speed appeared to be the main consideration to those actually in need of houses. In most countries, however, after the war an endeavour was being made to increase the number of houses and to secure a higher standard of housing for the future than has prevailed in the past.

Undoubtedly the World War was the chief cause of the universal house shortage in the countries affected by it. During the war house-building almost ceased; even the loss caused by a number of houses passing out of use each year was not met, and, in addition, populations increased despite the war. In northern France, in Belgium, and in the war-devastated portions of the world generally there was also a special loss of houses. But the war was not the only cause. Even before the war there was a growing shortage of small houses, and probably special measures would have been necessary to cope with it. The cause of this pre-war shortage has been variously estimated, but finance had much to do with it. There was a difficulty in building small houses where they were needed, at a suitable rent—suitable, that is, to the pockets of the tenants. That was one of several difficulties which still confronted private enterprise in 1921, but whereas it caused a slowing down in pre-war years it afterwards produced very nearly a cessation.

Some of the results of the shortage are familiar, including overcrowding, and all that it means. Again, the shortage formed one cause of social unrest. Further, slums cannot be cleared until their occupants can be re-housed. The problem of overcrowding is, however, not identical with that of the shortage of houses. Some families live in one or two rooms because of poverty and the like. There are no recent national statistics about overcrowding, the latest available in 1921 for the United Kingdom being those derived from the 1911 census returns, showing that 9% of the population of England and Wales were living more than two persons per room. The percentage was over 30 in Sunderland, Newcastle, and neighbouring towns, and in London was 17·7 per cent. It may here be added that there has been a growing recognition on the part of large employers of labour that they have an interest, if not indeed a responsibility, in the housing of their workers; and in several instances employers have helped to supply the need. In areas where new works are erected there is an influx of workers often resulting in overcrowding. Much information on this subject is given in "Housing by Employers in the United States," *Bulletin of the U.S. Bureau of Labor Statistics, No. 263*.

The housing problem has become especially difficult in several areas by the lack of suitable building sites, involving the problem of cheap and quick transport. Most people like to live within easy reach of their work, and if more houses cannot be built near (for instance) collieries in Wales and offices and works in London, there must either be overcrowding, or a good tram, bus, or train service to the areas where houses can be built. In the case of some works and offices there is an alternative, namely to move them from the crowded city centres to satellite towns, and this alternative has had attention. To overcome the difficulties of housing in the populous and prosperous South Wales coal-fields, it has been suggested by a committee of investigation that dormitory towns be built by the Government in a cleaner atmosphere with surroundings giving a less confined outlook, though still within easy reach of the collieries by train.

But the solution offered by dormitory towns, though probably the only one possible in South Wales, is not complete. The garden city, or satellite town, is better. The promoters of garden cities insist that works and offices should be moved to such cities, and thus that the people can have suitable work without travel. Much useful information on this subject is published in England by the Garden Cities and Town-Planning Association, 3, Gray's Inn Place, W.C. 1; and the International Garden Cities and Town-Planning Association with which it is allied held an important conference in London in 1920, attended by a large number of foreign delegates, and presided over by the veteran president and pioneer of the movement, Mr. Ebenezer Howard.

UNITED KINGDOM.—A good indication of the housing problem is to be found in the legislation in force in the United Kingdom. The first of the Acts is the Housing of the Working Classes Act, 1890. It repealed a large number of previous Acts, going back to 1851, but had their main objective, namely, the removal of unhealthy housing conditions. It had little concern with the provision of new houses, and the powers in that regard which it conferred on local authorities were adoptive only. This may be taken as evidence that the shortage of houses was not then a problem requiring serious action by the State. Even in the Act of 1909 (the Housing, Town-Planning, etc., Act, 1909) the powers with regard to the provision of houses by local authorities were left optional. It was not until the Housing, Town-Planning, etc., Act, 1919, was passed that they became duties.

The 1890 Act contained somewhat elaborate provisions enabling local authorities to remove unhealthy housing conditions. There were powers to enable the authorities to compel landlords to repair houses; houses could be closed until made fit, or demolished; small groups of unfit houses and large areas

could be acquired for improvement (mainly demolition) purposes; and there were many cognate powers and provisions.

In 1894, 1900 and 1903 short Acts were passed amending the 1890 Act chiefly in matters of administrative detail.

In 1909 the subject of "town-planning" had come to the front, and a large and interesting part of the Act passed in that year was devoted thereto.

Another important new provision was that prohibiting the erection of back-to-back houses. The following extract from a summary of the report for 1918 of the medical officer of health of Birmingham is typical of a mass of evidence on the subject of such houses:—

"In 1913 there were 43,366 back-to-back houses in Birmingham housing 200,000. In six wards, all in the central area, from 51 to 76% of the houses were of this kind. During the period 1914–8 four of these wards had a general death-rate of more than 19 per 1,000; five an infant mortality greater than 134 per 1,000 births; three a measles death-rate above 0·56; five a death-rate from pneumonia and bronchitis above 3·63; five a phthisis death-rate above 1·63; and five a mortality rate of over 29 per 1,000 births for deaths at ages under two from diarrhoea and enteritis. As a contrast we may take King's Norton with less than 8% of back-to-back houses. The death-rate here from all causes is less than 10·9, the infant mortality less than 78, the measles mortality less than 0·15, the bronchitis and pneumonia rate below 1·62, the phthisis rate below 0·89, the diarrhoea and enteritis figure below 9. Some of the inhabitants may be shiftless and criminal, unfit to thrive in any environment, but it is impossible to imagine a rising generation of young people being able to improve in health or self-respect, even if the best of educational facilities are provided, when everything they come in contact with is sullied by dirtiness and squalor."

The 1909 Act also amended in some detail the 1890 Act, and brought it into closer touch with the conditions and the problem as then existing. But it contained nothing to indicate that there was a general shortage requiring action beyond the power of private enterprise. There were local shortages and congestion. Certain local authorities might want to build, but, excluding the rural problem, mainly by way of re-housing poor persons to be removed from unfit dwellings. However, by 1911 a general shortage was threatening. Private enterprise had supplied 95% of the houses built, and continued to do so up to 1915, but the output was slackening.

The following statistics on the subject are interesting:—

*New Houses Built.*

| | England and Wales | | Scotland | |
|---|---|---|---|---|
| | Houses under £20 rental | Houses of rental £20–£41 | Houses under £20 rental | Houses of rental £20–£41 |
| 1904–5 | 99,905 | 25,026 | 12,933 | 2,129 |
| 1911–2 | 44,821 | 14,300 | 1,429 | 1,540 |
| 1912–3 | 45,632 | 13,926 | 2,491 | 1,784 |

The year 1904–5 was one of high-water mark in building, and on the assumption that in England and Wales 100,000 new houses are required each year, it will be seen that there was under-building from 1911, and that there was every indication of a new problem before 1914. In 1904–5 the annual value of the 99,905 houses under £20 rental was roughly £13 each, and of the 25,026 houses at £20–£41 rental it was roughly £28. The corresponding figures for Scotland were £12. 10s. and £28. It is difficult to compare these figures with those for the houses being built in 1921, as the quality, it is contended, had been improved; but if an economic rent were charged for the latter it would be at least three times as great as the rent of pre-war houses.

Further evidence that the output by private enterprise was slackening before the war is to be found in the *48th Annual Report* of the Local Government Board for 1918–9:—

Number of Houses proposed to be erected by Local Authorities.

| Year ended | |
|---|---|
| March 31 1911 | 464 |
| March 31 1912 | 1,021 |
| March 31 1913 | 1,880 |
| March 31 1914 | 3,291 |
| March 31 1915 | 4,408 |

The number of local authorities concerned in these efforts was 181 in the year ending March 31 1915. This, however, is but one-tenth of the local authorities, and it should be remembered that much of the housing proposed was connected with slum clearances and the serious lack of houses in rural areas. On the latter point the report of the Local Government Board for 1912–3 shows that loans had been sanctioned to district councils for housing in 42 villages, in 21 of which there would be a deficit to be met by the ratepayer. The shortage caused by the war thus came at an unfortunate moment, and even in 1917 it was clear that extraordinary measures would have to be taken as soon as possible after the cessation of hostilities.

It should be mentioned that, following the outbreak of war, the Housing Act, 1914, and the Housing (No. 2) Act, 1914, were passed. These, however, were of limited application and had little general effect.

In July 1917 the Government took the first steps towards meeting the after-war housing problem, and issued a letter to the 1,806 local authorities (borough, urban and rural district councils) in England and Wales asking for a return as to housing conditions and needs. There were 1,660 replies indicating an immediate need for some 400,000 working-class dwellings. A similar letter to the 311 Scottish local authorities resulted in returns showing a need for 109,000 houses. The Royal Commission upon Housing in Scotland estimated in 1916 that 121,000 houses were needed to remove overcrowding and to remedy uninhabitability of houses at that date. They estimated that if the standard were raised very moderately no less than 236,000 houses would be at once required. In Aug. 1921 a departmental committee supported these conclusions, and pointed out that in Glasgow there were 12,000 houses which had been condemned by the medical officer of health as unfit for human habitation, but which, owing to the housing shortage, were still occupied. In the House of Commons on April 14 1921 it was stated that the number of houses estimated to be required in Ireland was 53,033.

The Government then announced the financial assistance it would grant to local authorities providing houses, it being evident that private enterprise could not meet the demand. Negotiations followed on the subject of this financial assistance, but there was nothing accomplished of a very settled character at the date of the Armistice. On Nov. 14 1918 the Government issued a further letter, but the replies indicated meagre possibilities of an early start. In Feb. 1919 the Government made its final offer, to the effect, broadly, that it would bear the annual loss in excess of a penny rate, subject to the conditions laid down. That there would be a deficit was clearly recognized by all. There was a scarcity of building materials and of labour, and it was certain that the cost of each would be high. To set off against this high cost there would be only the rent receivable, and the tenants could not pay the rent necessary to prevent a deficit. The local authorities accepted this offer and the Government introduced the Housing, Town-Planning, etc., Act, 1919. The chief provisions of this Act were: to make it the duty of every local authority to survey the housing needs of their district, and to prepare and carry out a housing scheme to meet the needs and to provide for action on the default of a local authority; to give financial assistance to local authorities, and to public utility societies; to facilitate dealing with slum areas; in conjunction with the Acquisition of Land (Assessment of Compensation) Act, 1919, to facilitate and cheapen compulsory acquisition of land; to simplify the procedure of town-planning and to make it compulsory on towns with over 20,000 inhabitants.

This was a very heavy programme, involving an almost incredible amount of hard work. The subject bristled with difficulties, and the strength of the Ministry of Health (which was given charge of the scheme) was taxed to the uttermost. The local authorities' surveys showed an estimated need of new houses in England and Wales of over 800,000. This was a decided overestimate, and revisions reduced the number considerably in a very large number of cases.

But though the Act was no doubt well conceived, progress in building was slow, and the Housing (Additional Powers) Act, 1919, was passed. The chief purposes of this Act were: to provide a subsidy, amounting in the aggregate to £15,000,000, to private persons building small houses; to check luxury building; to

prevent the demolition of dwelling houses; to enable local authorities to issue housing bonds; to facilitate the acquisition of land for the purpose of garden cities or town-planning schemes.

The subsidy was at first £160 for the largest type of house permitted and £140 for the smallest, but the heavy increase in the cost of house building soon resulted in the increase of the subsidy by £100 per house. The subsidy, originally offered for 12 months only, was subsequently extended by the Housing Act, 1921, but withdrawn in July 1921. The results to May 1 1921 were announced in the House of Commons on May 12 1921:—

| | |
|---|---|
| Houses under approved tenders | 176,000 |
| Houses under signed contracts | 160,000 |
| Houses commenced | 102,000 |
| Houses practically completed | 45,000 |
| (The latter two items include "subsidy" houses.) | |
| Average loss to the State on each house built by local authorities | £60 per annum |
| Tenders for average-sized house:— | |
| July 1919 | £650 |
| Aug. 1920 | £950 |
| May 1921 | £855 |

Early in 1921 the Government reviewed its housing programme, and on July 14 the following statement was made in Parliament by the Minister of Health:—

"The number of houses built, building and contained in approved tenders under the housing scheme for local authorities and public utility societies is now about 176,000. Under the scheme of subsidy to private builders the number of houses built or to be built is estimated at about 23,000. The annual cost to the State under the local authorities and public utility societies' schemes is about £10,000,000 per annum, and the amount required for the payment of subsidies to private builders is about £5,000,000.

"In view of the immense difficulties confronting the nation during and after the war the Government think that they have no reason to be dissatisfied with the scale of their contribution to the housing problem—a contribution, notwithstanding the grave embarrassments of the war, without precedent in our history. The Government is, under its housing scheme, performing, at great cost, a work of supreme national importance which private enterprise could not carry out. At the present time the houses which are being built or are to be built under the Government Housing Scheme will utilize all available labour for at least twelve months, including a considerable number of ex-service men to be absorbed in the industry. By the end of twelve months conditions may have changed very greatly, prices may be stabilized, and the considerations upon which Government action should be based may be fundamentally altered. Reconsideration is, moreover, imperative when regard is paid to the present financial condition of the country.

"The Government have accordingly decided that, for the time being at any rate, the following limitation must be placed on housing expenditure. The number of houses to be constructed by local authorities and public utility societies with Government assistance under the present scheme will be limited to 176,000, that being the number built, building, or for which tenders have been approved, and assistance will not be given under the scheme in respect of any houses in excess of that number. It would appear that on a final examination of the present approved tenders some adjustments will be possible to meet cases of hardship without exceeding this total.

"All expenditure in connexion with the housing schemes which has already been incurred by local authorities with the approval of the Ministry of Health will rank for financial assistance under the present scheme, which limits the liability of local authorities to the produce of a penny rate, and where work undertaken by local authorities with the approval of the Ministry of Health cannot for reasons outside the control of the authorities be completed by July 1922, the time for completion will be extended as may be necessary.

"As regards the scheme of subsidy to private builders, the powers taken under the recent Act will be exercised to the extent of making payment in full for houses completed within the four months after the expiration of the previous Act, *i.e.* by April 23 last, and additional houses will be subsidized only if begun before July 1, under a certificate or the promise by a local authority of a certificate. There will be cases in which commitments have been entered into, although construction has not actually been begun, in anticipation of the continuance of the subsidy. In order to meet these cases I shall, in the exercise of my discretion, pay subsidy where commitments have been entered into, if work is started within six weeks.

"The Government recognize the urgent necessity of making what improvements are possible under present financial circumstances in slum areas. To this end they are prepared to provide an annual contribution not exceeding £200,000 towards the deficiency on local authorities' accounts for the improvement of slum areas. This annual contribution will continue for the whole term of such loans as may have to be raised by local authorities.

"It is the intention of the Government to keep the housing problem closely under review. They fully recognize the importance of that problem from the point of view of the health and social conditions of the people, but it is impossible to incur greater commitments than our finances will allow."

On the same date the figures for Scotland were given as follows: houses built, building or contained in approved tenders, by local authorities and public utility societies, 21,749; private builders' subsidy houses, 2,220; Government assistance to be limited to a total of 24,500 houses; annual charge for local authorities' houses, £1,087,450; total cost of private builders' subsidy, £550,000. The figures for Ireland were not given.

Town planning, though dealt with in the Acts above mentioned, is not exclusively a housing subject. Its object is to put a check on indiscriminate development. The policy of planning ahead enables a local authority to check the crowding of houses together, and to avoid the repetition of the haphazard development of the past, with its bequest of road widenings and other improvements rendered exorbitant in cost through the demolition of misplaced property. In the preparation of town-planning schemes attention can also profitably be given to the claims of industry. The schemes in existence in 1921, in so far as they prescribed restrictions as to the character of buildings, were chiefly concerned to preserve the amenities and healthful conditions of residential districts. But town planning should be of at least as great a value to industry. In America the art of "zoning" is practised as much with a view to the suitability of sites and convenience of transport for industrial undertakings as for the protection of house property.

The following table shows the number of town-planning schemes in contemplation, in course of preparation, or in actual operation, on March 1 1921:—

| Position of scheme | No. of schemes | No. of L. As. submitting schemes | Acreage covered by schemes |
|---|---|---|---|
| 1. Schemes finally approved (incl. one amending scheme) | 7 | 5 | 10,329 |
| 2. Schemes submitted and not yet approved | 9 | 8 | 23,216 |
| 3. Schemes authorized under Act of 1909 to be prepared but not yet submitted | 155 | 101 | 275,051 |
| 4. Resolutions under Act of 1919 deciding to prepare schemes— | | | |
| (I.) Not requiring approval | 42 | 39 | 151,283 (approx.) |
| (II.) Approved | 18 | 15 | 77,232 (approx.) |
| 5. Resolutions awaiting approval | 7 | 7 | 46,153 (approx.) |
| Totals | 238 | 154 (net) | 583,264 |

Thus 154 local authorities were engaged in preparing 238 town-planning schemes covering over 583,000 acres.

On the subject of the advantages which might be anticipated from town-planning schemes and improved transport facilities, the Registrar-General of Births, Deaths and Marriages had a significant paragraph in his report for 1918. He gives two tables of the county boroughs arranged in order of low infant mortality rate, and says that, as might be expected, the highest places in both tables are occupied for the most part by residential towns, "but the position of East Ham (a working-class area in the east of London), seventh for the mortality of the first twelve months and thirteenth for that of the first four weeks, out of the whole 82 county boroughs, shows what results may be attained in a working-class community. The conditions here of course differ materially from those of the more common case where the areas of industry and residence coincide; and the habitually low rates returned by this and neighbouring residential working-class suburbs of London are of good omen for the success which may be achieved elsewhere by improvements in town planning and transport."

Another part of the Housing, Town Planning, etc., Act, 1919,

amended and brought into line with modern conditions the Small Dwellings Acquisition Act, 1899, enabling local authorities to lend money so that occupiers may become owners.

Other Acts bearing on housing are the Land Settlement (Facilities) Act, 1919, and the Acquisition of Land (Assessment of Compensation) Act, 1919. The former deals with the powers of county councils in connexion with the settlement of soldiers on the land and the provision of the necessary houses. The latter simplifies the machinery for the assessment of compensation for land taken compulsorily for housing. Of other Acts affecting housing the chief are the Public Health Acts; but one which has a powerful temporary influence was the Increase of Rent, etc., (Restrictions) Act, 1920, which restricted the rent to be charged by landlords for houses (built before April 2 1919) of the type of which there was a shortage, to that charged at the outbreak of war, plus percentage increases of, generally, 40%. People paying such rent and increases could not be evicted except in special circumstances. This Act would expire on June 24 1923.

The above summary of the Acts shows their broad effects in England and Wales. The legislation affecting Scotland and Ireland is almost identical, with, however, special provision for crofters in Scotland.

The position in England and Wales up to July 1921 was briefly as follows: There were roughly between 7,000,000 and 8,000,000 residential houses. The average life of a house is not more than 100 years, and it was urged that from 70,000 to 80,000 new houses were needed on that head every year. Further, there is the growth of population, estimated by the Registrar-General of Births, Deaths and Marriages as calling for 140,000 new houses during the decade 1910–20. (Population growth had been checked during the war.) But the houses required had not been provided during the war, and only a part was provided for some years previously. The result was a shortage variously estimated as being from 500,000 to 800,000. Of this number the State was helping local authorities to provide up to 176,000, at a cost to the State estimated at £10,000,000 per annum. (In addition the State was finding £5,000,000 in a lump sum as a subsidy to private builders.) This annual loss would vary in accordance with the cost of building and the rents which could be secured for the houses. On June 1 1920 the average officially approved rent on the new houses was 12s. 3d. per week, exclusive of rates: 1·5% were under 6s. and 1·5% over 20s. The lower rents were charged in rural districts. Generally the rents payable cover from one-third to one-half of the cost of providing the houses.

Public financial assistance to housing schemes is not a new principle. Up to 1914 52,000 cottages had been built by Irish local authorities at a cost of £8,500,000, and there was an annual loss thereon. In Liverpool people displaced from slums had been re-housed by the local authority at less than an economic rent, and in several county villages the local authorities had provided cottages on which there was a loss.

On March 1 1921 there were 108,168 men, of whom 54,479 were skilled, employed on the housing schemes of local authorities and public utility societies; but 10,686 additional skilled men were required for the work actually in hand, while a considerably larger number could have been employed on schemes for which official approval had been given.

The Government had made several attempts to increase the supply of labour, and steps had been taken to meet other difficulties arising, particularly that of the heavy cost of building. Many new building materials had been tested.

CANADA.—The progress of housing in Canada has not been rapid, in spite of the fact that the Federal Government in March 1919 voted a credit loan of £5,000,000 for general housing purposes. The money was to be distributed in proportion to population, a grant being made to the Government of each province for the municipalities on condition that they submitted suitable housing schemes. But the plan met with opposition from some local authorities, who refused to work under the Federal scheme. The impression, too, prevailed among the working population that the restrictions and guarantees demanded by the Federal and provincial Governments made it impossible for workmen to acquire a loan. The grant allocated to the province of Ontario amounted to about £1,800,000, but it was expected that the provincial Government would be compelled to finance housing to the extent of £3,000,000. Sixty-six of the municipalities had by Sept. 1919 agreed to work under the scheme, 21 of which had already begun building, but the largest municipality, Toronto, had refused to coöperate, as it preferred to finance its own housing schemes. The city council of Halifax (Nova Scotia) rejected the Federal scheme, objecting that it was impracticable and would impose too heavy a burden of debt on the city. The work of rebuilding the area of Halifax, which was destroyed in 1917, went forward steadily under the auspices of the Halifax Relief Commission. The municipal authorities of Winnipeg had agreed to accept the Federal grant, and it was estimated that they would have 200 houses completed by the spring of 1921. Much dissatisfaction prevailed in Winnipeg with regard to high rents, and a Tenants' Protective Association was formed as a means of redress. A building society was created in connexion with the association.

AUSTRALIA.—The large cities of Australia suffer from a very pronounced shortage of houses, and one of the causes is said to be the growing tendency of the country inhabitants to drift towards the towns. One writer states that the population of several leading rural centres in Victoria is distinctly on the down-grade, whilst figures published in Sydney show that the number of persons engaged in rural pursuits in New South Wales steadily diminished from 154,000 in 1912 to 142,000 in 1917. The war is said to be only partially responsible for this alarming wastage of country population. The housing of returned soldiers and of their dependents in Australia is carried out by the Repatriation Department, which drew up a housing scheme based on the War Service Homes Act of Dec. 1918. The Government made a grant of £20,000,000, and out of this fund the housing commissioner was empowered to acquire private or crown lands, upon which dwellings to the value of £700 each were to be erected. The applicants eligible under the Act are enabled to acquire houses on easy terms, one condition being that they do not own a house elsewhere, either in the Commonwealth or outside it. The Federal Housing Commissioner has invested in land on behalf of the Repatriation Department, but the building of houses has been retarded by the great scarcity of building materials.

The question of housing the civilian population of Australia is left to the Governments of the different states. New South Wales has been the most active, probably because the shortage there is more acute than in the other states. A housing department was created and a minister appointed. The sum of £500,000 was allocated from state funds for building purposes, and the minister promoted schemes for the extension of suburbs outside Sydney and Newcastle, where housing conditions were especially bad. There is no indication of a like activity on the part of the other state Governments in dealing with housing, except in Queensland. In spite of the house famine prevailing in Melbourne the question of housing had not advanced much by 1921 in the state of Victoria.

NEW ZEALAND.—Housing conditions in the larger towns of New Zealand, particularly in Wellington and Christchurch, are in an unsatisfactory state. It is said that Wellington had been suffering for years from failure of private building enterprise, and had reached the stage in 1921 when State or municipal intervention was imperative on account of the shortage and overcrowding which prevail. The position was not much better at Christchurch, where about 1,000 new houses were needed.

The efforts of the New Zealand Government in the direction of practical housing were confined to authorizing the Labour Department to build 200 dwellings in Wellington. Certain clauses of the Public Health Amendment Act of Dec. 1918 were aimed at the prevention of overcrowding and the demolition of unhealthy buildings, but they could hardly produce much effect as long as the shortage of accommodation continued.

The Parliamentary Committee on Industry presented its report in Aug. 1919, and the following were some of its recommendations: That a national Housing Department be set up, which should formulate a comprehensive scheme of house construction; that £2,000,000 be allocated towards the scheme; that the houses be available, by preference, for men with incomes below £300 a year, with an additional allowance of £25 per child in cases where there are more than three children; and that local authorities be empowered to engage in housing schemes.

SOUTH AFRICA.—The cost of living, together with the high rents and the prevailing shortage of houses, has caused much discontent in South Africa. The Government was urged to take steps to deal with the control of rents, to finance building undertakings, and to take steps to clear slum areas, as it was felt that the question had assumed national proportions requiring the intervention of the State. Not much had been accomplished by the Government up to 1921 towards solving the question. Some legislation had been passed, notably the South African Health Act, by which the duty of supervising housing conditions in urban areas and of enforcing the observance of proper building standards by local authorities is vested in the Department of Public Health. Another measure was passed in June 1919 to enable the town council of Durban to borrow money for housing purposes and to build and erect its own houses. A housing commissioner was appointed in Sept. 1919 to investigate conditions in several municipal areas and to report whether it would be advisable to give financial or other assistance to local authorities for providing houses for people of limited means. Matters

were specially unsatisfactory in Johannesburg, where it was necessary to provide temporary accommodation in tents for persons who had no houses. A few of the large municipalities of South Africa have adopted the plan of building houses for their employees. The authorities of Cape Town built a garden village in the suburbs for this purpose, and Port Elizabeth had a similar scheme in view.

INDIA.—The outstanding feature with regard to housing in India is the question of high rents, which had entailed considerable hardships on the inhabitants of the large towns. In some of the provinces temporary legislation against rent profiteering has been carried out. Although the question of rents most engages public attention, there is also a serious shortage of housing. The shortage of accommodation in Bombay, for instance, was estimated in 1920 at 49,000 permanent dwellings. The population of this city was over a million; and the large majority of the population lived in one-room tenements. The squalor of the slums of Poona, Surat, and Ahmadabad has been the subject of comment. Town-planning on a large scale has been carried out at Delhi, where a suburban area of 800 ac. has been acquired by the Government. This district has been laid out on simple lines, with wide streets, and building sites have been leased for long periods.

FRANCE.—The principal sufferers from the housing shortage in France are the inhabitants of the larger towns. In Paris the position is especially unsatisfactory; overcrowding prevails extensively, and conditions from the point of view of health are said to be deplorable. Housing conditions in the seaports may be exemplified by the case of Marseilles, where ruinous houses, condemned as unfit for human habitation, whose demolition had already been begun before the war, were again in 1920 in occupation. Commercial firms found great difficulty in obtaining labour in the locality owing to the shortage of accommodation for workmen.

There was not much evidence in 1921 of the building of dwellings either by public authorities or by building organizations. In Sept. 1919 the "Cheap Dwellings Bureau" of the Department of the Seine was engaged on plans for the erection of several garden suburbs outside the city of Paris, but the high cost of labour, the difficulties of transport and other obstacles to building retarded the progress of these developments very appreciably.

The Government passed some legislation, with a view to suppressing rent speculation, by which a certain rent limit is fixed, due allowance being made for increase from natural causes (building costs and so on). A decree was also issued to the effect that in towns of more than 10,000 inhabitants the owners of boarding or lodging houses must exhibit on their premises notices stating the number of rooms they have to let, and the rents which they ask for them. Notifications containing the same information must also be forwarded to the municipal housing office, should such an office exist in the locality. This legislation is due to the extraordinary demand for hotel and boarding-house accommodation, which had been increasing in proportion to the decrease in dwelling-house accommodation; in Paris the number of persons living in such buildings in 1910 was 129,622, but by 1918 it had increased to 287,156.

ITALY.—The attempts to meet the housing shortage in Italy have taken the form, in the northern towns, of the institution of coöperative societies and building clubs. In the central and southern districts the movement met with less success, as private individuals and coöperative societies were unwilling to invest their money in the building trade, and wished to be guaranteed by the State against any risk of loss. The building operations which had been inaugurated throughout Italy up to 1921 were expected to cost about £10,000,000; the Minister of Industry made an annual State grant of £400,000, and was prepared to increase it if the inhabitants and the cooperative societies showed the requisite activity. The Italian Government passed some legislation dealing with taxes on building. The houses built before April 1924 would be exempt from building and supertaxes for six years, and for four years after the builders would be required to pay half only of such taxes. If the building of these houses was begun before Jan. 5 1920 and finished before the end of 1921 they were to be exempt from all taxes and supertaxes for the whole of the succeeding 10 years.

In order to facilitate the building of workmen's dwellings in Rome the Government issued a decree dealing with State loans, by the provision of which the Treasury might advance sums up to the amount of £1,600,000 to the Ministry of Industry, Commerce, and Labour, which would make loans to building societies through the medium of the Bank of Loans and Deposits, the loans being guaranteed by the State. Supplementary advances up to the amount of £400,000 would be made for roads and public services constructed by the municipality in connexion with the building schemes. The allocating of the grant was to be decided by a committee, presided over by the Minister for Industry, and composed of representatives of building institutions, the Bank of Loans and Deposits, and the municipality of Rome. The committee would exercise supervisory powers over the projected building schemes.

GERMANY.—The difficulties of the situation were increased after the cessation of the war, and the shortage of houses was in 1921 greater than ever. The shortage had increased by reason of the demobilization of the army and the large influx of persons returning from abroad and from Poland. The office of Housing Commissioner for Prussia lapsed in Sept. 1919, when the administrative work of housing was vested in the Home Colonization Department of the Ministry for Social Welfare. An order issued by the Department in 1921 countermanded an earlier order respecting the entry of new residents into towns already full. The original order granted permission to some municipalities to veto this right of entry, but as the shortage increased numerous rural and other urban authorities clamoured for similar powers. In view of the economic disturbance that might ensue if the practice became widespread the Ministry withdrew the concession altogether. The rationing of house-room and the billeting of civilians in private houses was enforced in a number of towns, whilst supervision was exercised by the Housing Registration Offices over the letting or selling of houses.

The position of affairs in the large towns may be illustrated by the situation in Munich, where towards the end of 1919 the director of the Housing Office stated that matters were going from bad to worse, and that applications for houses to the number of 7,917 had been made at the local House Registration Office, the total number of empty houses available being twenty-three.

A considerable number of Home Colonization Associations were formed all over the country for the purpose of diverting the urban population to rural settlement areas, and in one mining district in central Germany a Home Building Association was formed, whose members intended to build houses for each other when their eight-hour day's work was ended.

NORWAY.—The shortage of small dwellings in Norway was estimated at a total of 18,000 at the beginning of 1919. The housing problem was said to be largely a financial one, as there was a great need of a well-organized credit system in Norway. There were a few credit institutions, the most important being the "Workmen's Holdings and Dwellings Bank," whose powers were extended by the passing of a law in July 1919 which increased the powers to grant loans and allowed the local authorities to assume responsibility for larger sums than hitherto. In addition, an agreement was concluded between the Small Holdings and Dwellings Bank and the Norwegian Shipping Owners' League, whereby the latter placed a loan of £562,500 at the bank's disposal in order that it might once again be in the position to issue loans. A Housing Council, which was appointed in 1916, reported to the Government in 1919. One of the first practical results was the granting in Nov. 1919 of a loan to the Council of £562,500 out of Government funds, to be used for the building of dwellings of not more than five rooms.

SWEDEN.—The decrease in building activity in Sweden resulted in acute distress as regards certain localities and certain classes of the community. The shortage of dwellings evoked clamorous demands, especially on the part of the extreme socialists, for the rationing of housing accommodation and other measures of State intervention. The Swedish Social Board, however, maintained that such measures would encroach on the privacy of domestic life, and would probably not result in any real improvement. The Board deliberated on the report presented by a special committee of experts appointed by the Government to investigate the conditions of housing in Sweden, and the main conclusion which it derived from the report was that the State should, in the first place, provide dwellings for Government employees. It proposed that a State grant of £5,600,000 per annum should be made during the next few years, and that £4,000,000 should be devoted to this purpose. The chief means recommended for obtaining the funds was a new Government lottery bond loan. A loan of this kind to the amount of £5,600,000 was floated in £2 bonds towards the end of 1919, and was a great success.

HOLLAND.—A law was passed by the Government in 1918 dealing with measures to be adopted by the State and local authorities to relieve the distress caused by the shortage of houses. The law empowered the Government to order the local authorities to prepare statistics as to housing, and to promote building schemes with a view to providing temporary huts as well as more permanent dwellings. The State was to advance, in the form of loans, 90% of the cost of building, the amount thus allocated, in 1918, being over £1,000,000.

The total shortage of houses in Holland was estimated in 1920 at 60,000. The need was very great in Amsterdam, where about 15,000 houses were required; in order to cope with the situation adequately it would be necessary for the municipal authorities to build 6,000 houses per annum for five years. For the whole country 49,000 required to be erected each year during the same period. A scheme was prepared by which 10,000 houses were to be built by the Amsterdam municipal authority and 18,000 by the building societies.

SWITZERLAND.—The housing shortage is acute in Switzerland, especially in Geneva and Berne. In the case of Berne a special decree was issued by the Federal Government, authorizing the local authorities to allow the tenants to remain in the houses which they occupied if they had no hope of obtaining other accommodation. Matters were better at Zürich, owing to the farseeing policy adopted by the local authorities during 1910–20. The Swiss Government made a credit vote of £400,000 to be allotted to the local authorities in whose districts the shortage was most urgent. Grants might be made to private individuals and to societies which were prepared to undertake building operations, provided that the Cantons showed willingness to take their share by advancing similar amounts.

UNITED STATES.—The housing conditions prevalent in the United States do not differ materially from those of European countries, although, being new, the country suffers somewhat less from survivals of antiquated forms of architecture and obsolete forms of sanitation. On the other hand, the general use of wood in house and apartment construction renders the fire risk greater than that of European cities. It can be safely stated that every one of the European housing problems is reproduced in the United States to some extent. Reports of investigating commissions for American cities show congestion, poor planning, poor lighting, inadequate ventilation, overcrowding of rooms, and wretched conditions of sanitation and of general maintenance. These undesirable conditions of sanitation and maintenance are reproduced also in the poorer agricultural regions.

Since 1910 there has been a notable increase of interest in the housing problem in the United States. The establishment of the National Housing Association in that year, and the efficient publicity conducted by its secretary, Mr. Lawrence Veiller, led to the establishment of temporary or permanent housing associations or commissions in virtually every important city. Fairly extensive housing investigations have been conducted in more than 60 cities. Among the more recent investigations of this character the surveys of urban and rural housing conditions of California by the State Commission of Immigration and Housing are notable. The report of the Housing Commission of Michigan published in 1916 may be mentioned as another admirable example of a survey by state authorities. Many local investigations by private agencies have also been made during this period.

Among the best of the reports of these studies are:—*The Housing Problem in Chicago,* edited by Sophonisba Breckinridge and Edith Abbott of the School of Civics and Philanthropy (1910–2); *The Houses of Providence, R.I.,* by John Ihlder (1916); *Housing Conditions in the City of St. Paul,* prepared by Dr. Carol Aronovici for the Amherst H. Wilder Charity (1917); *Housing Problems in Minneapolis,* by the Civic and Commerce Association (1914); *The Housing Report,* made to the City Plan Commission of Newark, N.J., by James Ford (1913); the annual reports of the Philadelphia Housing Commission; and *A Study of the Housing and Social Conditions in Philadelphia,* prepared by Dr. Frank A. Craig for the Henry Phipps Institute (1915).

*Legislation.*—The modern period in American housing legislation dates from the enactment of the Tenement Housing Act for New York City in 1901. Mr. Lawrence Veiller, who is largely responsible for the framing and passage of that law, published in 1914 *A Model Housing Law* (revised edition 1920), which has served as a model for legislation in many American cities during the past ten years. The housing legislation of Columbus, O.; Duluth, Minn.; and Grand Rapids, Mich., for example, is very closely modelled upon this book. Housing laws have been passed during 1910–20 in California, Connecticut, Indiana, Iowa, Kentucky, Massachusetts, Michigan, Minnesota and Pennsylvania. In most instances such legislation applies only to cities of a specified minimum size. In a few cases, however, the law is universal in its application. The legislation of Massachusetts is permissive in its character, but when adopted by any town or city it has the force of state law, and cannot be repealed or changed without the consent of the state Legislature. The enforcement of state legislation in New Jersey is centralized in a state board of tenement-house supervision, under a law passed in 1904. The annual reports of that board show efficiency in administration and considerable accomplishment in the control of housing conditions, in spite of the small appropriations made to the board. In other states the power of enforcement is either largely or wholly decentralized, with the minor exception of the laws of Pennsylvania, which centralize certain powers over sanitation and maintenance of old buildings. The most striking example of vigorous and effective enforcement of tenement-house legislation has been offered by the Tenement-house Department of New York City. The Tenement-house Act of 1901 lodged with that department exceptional powers and established heavy penalties for violations of the law. The appropriations to the department have been relatively large and its administration has been unusually competent.

*Agencies of Improved Construction.*—Most of the houses for the use of wage-earners in America are designed and erected by building contractors. Such houses are built to rent or sell for profit. The interests of the investors are considered before those of the occupants. Restrictive legislation is always necessary to govern the conditions of structure, sanitation and maintenance in such properties. In general, shrewd investors have found increasingly that tenement-house property does not pay as well as other forms of investment; hence such properties tend to be sold to recent immigrants who are eager to possess real estate but fail to appreciate the weight of the carrying charges of rapidly deteriorating residential property. In some cities, notably Philadelphia, row houses are still constructed in large numbers by operative builders to be sold in units to occupants. Nevertheless, home ownership, which would be facilitated by devices of this sort, is becoming less general in America from decade to decade. The population is increasingly living in rented houses or apartments, and housing conditions are determined by the owners and builders of these properties except in so far as legislation may protect the tenants. Attempts to improve upon prevailing house types have been made by other agencies of house construction, by philanthropic or limited-dividend housing companies, by employers of labour or industrial firms, by coöperative housing associations, or by departments of the state and national Governments.

*Limited-dividend Companies.*—Construction of model tenements has continued in New York City under the direction of the City and Suburban Homes Co., a corporation which in 1920 had a capital of $6,000,000 divided into shares of $10 each. Dividends amounting to 4¼% were paid on the invested capital. More than 13,000 persons were housed by this corporation. The construction of tenement houses has been improved in many ways by this company. Open stairways, roof gardens, central-heating systems and large courts are a few of its contributions to tenement-house construction. Its buildings invariably improved upon prevailing local standards in lighting, ventilation, fireproofing and general maintenance. The tendency of improved housing is, however, increasingly in the direction of residential decentralization, so that the construction of attractive homes for individual families has largely superseded the building of model tenements. Such homes are detached, semi-detached, grouped in units of from three to six families per building, or in rows. American village and suburban housing has borrowed its standards largely from the English garden-city and garden-suburb movement, though some concessions to local architectural practices are almost invariably made. Recent examples of suburban housing by limited-dividend companies are offered in the dwellings constructed by Schmidlapp in Cincinnati, the Improved Housing Association in New Haven, Conn., the Philadelphia Model Housing Co., the Billerica Garden Suburb, Lowell, Mass., and in the work of the Boston Dwelling House Co. near Forest Hills, Mass.

Many American chambers of commerce have established limited-dividend companies which have erected buildings of a suburban type. Among the better examples of such work during the past ten years are the buildings constructed by the Albany Home Building Co. at Albany, N.Y., the Bridgeport Housing Co. at Bridgeport, Conn., the Civic Building Co. at Flint, Mich., and the Williamsport Improvement Co. at Williamsport, Pa.

*Industrial Housing.*—Employers of labour and industrial corporations have constructed garden villages in virtually every state in the course of the past ten years. Probably the greatest actual contribution to improved construction of cottage dwellings up to the year 1918 was made by agencies of this class. Very pleasing industrial villages have, for example, been erected and operated by the Goodyear Tire & Rubber Co. at Goodyear Heights, Akron, O.; by the Norton Co. at Indian Hill, Worcester, Mass.; by the Mount Union Refractories Co. at Kistler, Pa.; by the Viscose Co. at Marcus Hook, Pa.; and by the Lehigh Valley Coal & Navigation Co. at Hauto, Pa. Practically all improved housing undertaken since the termination of the World War was fostered by industrial corporations or by chambers of commerce. These agencies alone can afford to invest considerable sums of money without expectation of an immediate return at the market rate of interest. In the long run industrial agencies presumably profit from their housing ventures through the better health and increased contentment of their employees, which increases their output, and reduces friction.

*Coöperative Housing.*—British experience in the formation of coöperative tenant societies has been closely watched by many Americans who are interested in the improvement of housing conditions. For several years a committee on new industrial towns, with headquarters in New York City, has issued pamphlets urging the establishment of coöperative garden suburbs and of garden cities.

As yet, their recommendations have not been adopted in any instance. The state of Wisconsin has passed an Act which is designed to promote coöperative housing in that state, but so far no association has been formed. Nevertheless, during the past decade many coöperative apartment houses have been constructed for the well-to-do and the movement has extended as a protest against rent

profiteering. Among immigrant populations the Finns have co-operatively purchased a number of boarding-houses in several cities and are engaged in operating them. In New York City they have purchased tenement houses as well. In Greater New York the Queensboro Corp. has recently built several apartment houses for sale to coöperative organizations of their tenants. But this movement is still in its infancy and will probably lag far behind that of Great Britain, because of America's relative lack of experience in economic coöperation in all its forms.

*Governmental Housing*—The most pronounced difference between the housing policies of Europe and those of American states and cities lies in the fact that American cities and states do not under any circumstances build houses for wage-earners. No American city has yet engaged in house construction, and it probably would be unconstitutional in most American states for cities to undertake such construction if they so desired. One American state, Massachusetts, has built houses with state money. An appropriation of only $50,000 was made for this purpose and a small tract of land was purchased in the city of Lowell, where 12 houses were constructed as a demonstration of methods of improved economical house construction. The houses so constructed have been sold on easy terms to their occupants, but the state Legislature has not been convinced of the utility of promoting further experiments.

The Massachusetts Homestead Commission, which was charged with the construction of these houses, has been eliminated, its functions being taken by the state department of public welfare.

The need of providing for the rapid manufacture of munitions and for the construction of ships forced the Federal Government, shortly after America's entrance into the World War, to arrange for the housing of the workmen engaged in war industries. In some instances the population could be housed in existing dwellings, but in more than a hundred communities it was found that manufacturing of materials needed for war purposes would be retarded unless houses were immediately constructed. There were three branches of the Federal Government which were engaged in house construction in the year 1918. The War Department built villages of temporary construction at the remote places where it had powder plants, bag-loading plants, etc. The Emergency Fleet Corp. built permanent villages for workmen engaged in construction for the U.S. Shipping Board. The land was provided by the ship-building companies, but the houses were planned, built and financed by the Federal Government through the housing and transportation division of the Emergency Fleet Corp. in 27 different towns and housed more than 9,000 families. The U.S. Housing Corp. which received appropriations from Congress amounting to $100,000,000, planned 128 communities for more than 25,000 families, in addition to housing accommodation for approximately 25,000 single labourers, and actually completed after the Armistice houses for more than 6,000 families and 8,000 single workers. Both the Housing Corp. and the Emergency Fleet Corp. built permanent houses, applying with considerable care and skill the principles of town-planning and of improved construction in virtually all of their projects. They convincingly demonstrated the value of village and suburban planning, and their experiments in the designing and construction of houses have had and will continue to have a pronounced influence upon subsequent housing undertakings of America. These houses in almost all instances are now being sold on relatively easy terms of amortization to their occupants. They are being occupied by skilled labourers and persons of relatively small means who are engaged in commercial pursuits. They have in no sense solved the problem of housing for the unskilled labourer, but are of great value as an indication of modes of planning and construction for families having an income of from $2,000 to $3,000.

*Housing Finance.*—The relative costliness of housing by the Federal Government combined with the pronounced distaste which the American people have for centralization of power has resulted in a strong reaction against the continuance of house construction by Government. There is, however, in the United States a sentiment for elimination of taxation of mortgages, a movement for tax exemption for new buildings and a movement for governmental aid in the financing of local housing undertakings. The chief American device for financing of individual house construction or construction of houses in small groups is the building and loan society. There were in the United States on June 30 1920 approximately 7,788 building and loan associations, with a membership of over 4,280,000 persons and total assets amounting to over $2,100,000,000. The funds are used almost exclusively for the construction or acquisition of house property. The state of North Dakota finances home building by the issue and sale of state bonds repayable with interest not to exceed 6%. One bill before Congress in 1921 would provide for the issue of Federal bonds which would nearly double the assets available to these associations for housing purposes. Other suggested measures present recommendations for credit legislation similar to that of Canada, providing for central funds, low interest charges, easy terms of amortization, experimentation, and advice in the matter of housing.

Several American states have established housing commissions since the war to handle questions of rent profiteering or other special problems. The housing committee of the N.Y. State Legislature has conducted an extensive investigation into profiteering and collusion in building construction which is to be followed by indictments for such malpractices as can be reached by law. Rent-profiteering commissions in many cities and states have succeeded in diminishing flagrant evictions and profiteering in rentals and have in thousands of instances succeeded in effecting conciliation or compromise between landlord and tenant. The necessity of increasing rentals in order to make a reasonable return upon invested capital and to encourage new construction has, however, not been appreciated by all such commissions.

At the beginning of the year 1921 the situation in the United States was as follows:—Building prices during and following the war had increased more than 100%; rentals during the same period increased by about 25%. The shrewd investor, seeing that he could make no profit in building houses to rent, invested his money in other enterprises. Very few houses had been built for sale because of anticipation of a fall in building costs. Late in the year 1920 building prices began to decline. As the decline had not yet stopped at the beginning of 1921 building had not yet recommenced. The actual shortage of housing in America is not measurable. There has always been a shortage of housing of good quality, but it is calculated by the U.S. Chamber of Commerce that if house-building had continued at the rate of construction which was normal in the pre-war years there would have been 1,200,000 more houses or apartments in the United States in 1921 than there were. Many years of conditions favouring building construction were needed to make up for a housing shortage of this magnitude.

**HOUSSAYE, HENRY** (1848–1911), French historian (*see* 13.828) died in Paris Sept. 23 1911. The fifty-fifth edition of his *Waterloo* appeared in 1906, and after his death were published *Jéna et la Campagne de 1806* (1912), and *La Patrie Guerrière* (1913).

See L. Sonolet, *Henry Houssaye* (1905).

**HOUSTON, DAVID FRANKLIN** (1866– ), American public official, was born at Monroe, N.C., Feb. 17 1866. He graduated from South Carolina College in 1887 and the following year was tutor there in ancient languages. From 1888 to 1891 he was superintendent of schools at Spartanburg, S.C., and from 1891 to 1894 was a student in the Harvard Graduate School (A.M. 1892). From 1894 to 1902 he was at the university of Texas as adjunct professor of political science, professor (after 1900), and dean of the faculty (after 1899). He was president of the Agricultural and Mechanical College of Texas from 1902 to 1905 and then returned to the university of Texas as president. Three years later he was elected chancellor of Washington University, St. Louis, but resigned in 1916. In 1913 he was appointed Secretary of Agriculture by President Wilson and in 1920 was transferred to the secretaryship of the Treasury. He was a member, generally *ex officio*, of the Federal Council of National Defense, the National Forest Reservation Committee, the Federal Reserve Banks organization committee, and chairman of the Federal Board for Vocational Education. He favoured woman suffrage but was opposed to raising a loan for a soldiers' bonus. He was the author of *A Critical Study of Nullification in South Carolina* (1896).

**HOWELLS, WILLIAM DEAN** (1837–1920), American novelist (*see* 13.839), died in New York May 11 1920. In 1915 he received the gold medal of the National Institute of Arts and Letters for his work in fiction. To within a short time before his death he continued to contribute to the "Editor's Easy Chair" of *Harper's Monthly*. His later works included *My Mark Twain* (1910); *Imaginary Interviews* (1910); *Parting Friends: A Farce* (1911); *Familiar Spanish Travels* (1913); *New Leaf Mills: a Chronicle* (1913); *The Seen and Unseen at Stratford-on-Avon: a Fantasy* (1914); *The Daughter of the Storage and Other Things in Prose and Verse* (1916); *The Leatherwood God* (1916) and *Years of My Youth* (1916). In 1920 he edited with an introduc-

tion *The Great Modern American Stories*. He left unfinished *Years of My Middle Life*.

**HUERTA, VICTORIANO** (1854–1916), Mexican general and dictator, was born in Colotlán, Jalisco, Dec. 23 1854. He began his military career as a boy, graduating from Chapultepec Military College in 1876, and immediately serving in the successful revolt of Porfirio Díaz against President Lerdo. He was then eight years on the Military Map Commission, from 1890 to 1900 was a member of the General Staff, and later fought Indian campaigns in Sonora and Yucatan. Díaz made him a brigadier-general. When the latter fell, Huerta escorted him to Vera Cruz, then joined Madero, and conducted campaigns against Zapata in 1911 and Pascual Orozco in 1912. From Feb. 9 to 18 1913 he commanded the Madero forces when the Díaz revolutionary forces were besieged in the arsenal at Mexico City and when several thousand non-combatants were shot by the ill-directed gunfire of Huerta's men. On Feb. 18 he betrayed Madero, forcing him and the vice-president Pino Suárez (who were later murdered) to resign and obliging Congress to ratify his usurpation of power. He was recognized as president by the foreign embassies, but President Wilson refused him recognition and insisted upon his elimination. In Oct. 1913 he was characterized as a murderer by a member of the Mexican Congress, who immediately disappeared. The deputies remonstrated, whereupon Huerta arrested 110 of them and seized the legislative and judicial powers. In April 1914 came the Tampico incident, when two American sailors were arrested and removed from a U.S. boat for a trifling cause. Huerta's refusal to make adequate apology brought about the occupation of Vera Cruz by U.S. troops. His resignation was forced on July 15 1914. He went first to Spain, then came to New York in April 1915. In July he was arrested in Texas, charged with instigating invasion of Mexico. He was taken ill after his arrest, and was released from custody just before his death at El Paso on Jan. 13 1916. He was a man of great will power, remarkable physique and native astuteness, but possessed no training in statecraft or great ability as a soldier. (H. I. P.)

**HUGGINS, MARGARET LINDSAY,** LADY (1848–1915), English astronomer, was born in Dublin Aug. 14 1848, the daughter of John Murray, a Dublin solicitor, and married Sir William Huggins in 1875. From childhood she had been interested in astronomy and entered with enthusiasm into her husband's work (*see* 13.857). She published lives of *G. P. Maggini* and of *Agnes and Ellen Clerke*, as well as various scientific papers, both alone and in collaboration with her husband, whom she survived for nearly five years, dying in London March 24 1915.

**HUGHES, ARTHUR** (1832–1915), English painter, was born in London Jan. 27 1832. In 1846 he entered the art school at Somerset House, his first master being Alfred Stevens, and later entered the Royal Academy schools. Here he met Millais and Holman Hunt, and became one of the pre-Raphaelite group of painters. His first picture, "Musidora," was hung at the Royal Academy when he was only 17, and henceforth he contributed almost annually not only to the Royal Academy but later also to the Grosvenor and New Gallery exhibitions. He also became widely known as an illustrator of books, his work in *Good Words for the Young* (1869) attracting much attention. With Morris, Rossetti and Burne-Jones he was responsible for the decorations of the hall of the Union Society at Oxford, which have now perished. He died at Kew Green Dec. 22 1915.

**HUGHES, CHARLES EVANS** (1862– ), American statesman, was born at Glen Falls, N.Y., April 11 1862. He graduated from Brown University in 1881. He then studied law at Columbia (LL.B. 1884). He was admitted to the bar in 1884 and for seven years practised in New York City. From 1891 to 1893 he was professor of law at Cornell and then resumed practice in New York City, serving at the same time for several years as lecturer in the New York Law school. In 1905 he was counsel for a commission appointed by the New York Legislature to investigate the cost of gas, and in the same and the following year was counsel for a legislative committee for investigating life-insurance companies. This investigation revealed many irregularities in the management of the companies and led to the passage by the Legislature of New York and of other states of remedial legislation. The same year he was nominated by the Republicans for mayor of New York City but declined to run. In 1906 he was elected governor of New York State, defeating William Randolph Hearst, and was reëlected in 1908. He resigned in Oct. 1910 after being appointed associate justice of the U.S. Supreme Court by President Taft. In 1916 he resigned from the Supreme Court on being nominated for the presidency by the Republicans, but was narrowly defeated by President Woodrow Wilson, who had been renominated by the Democrats. Hughes's election was considered assured when the campaign began; but though he "stumped" the country widely he disappointed the people because he took no definite position on any of the specific questions involving the stand of America in the World War and especially as regards the sinking of the "Lusitania." The result of the election was doubtful until a full count had been made, and eventually hinged upon Minnesota and California, normally Republican states. Hughes carried Minnesota by a few hundred votes but lost California by a few thousand. The electoral vote was 276 for Wilson against 255 for Hughes. The popular vote was 9,116,000 for Wilson against 8,547,000 for Hughes. The following year he again entered upon the practice of law in New York City. In 1917 he was appointed chairman of the Draft Appeals Board of New York City by Governor Whitman, and the following year was special assistant to the U.S. Attorney-General, in charge of the investigation of alleged waste and delay in the construction of aircraft. He was president of the New York State Bar Association in 1917–8 and of the Legal Aid Society 1917–9. He was opposed to Article X. of the League of Nations Covenant and urged special recognition of the Monroe Doctrine. He was the leader of the New York Bar Assn. in its opposition to the expulsion of the Socialists from the N.Y. State Legislature in 1920. In 1921 he entered the Cabinet of President Harding as Secretary of State. He was one of the four U.S. delegates to the Conference on Limitation of Armament, held in Washington, D.C., Nov. 1921, and was elected permanent chairman (*see* WASHINGTON CONFERENCE).

**HUGHES, RUPERT** (1872– ), American writer, was born at Lancaster, Mo., Jan. 31 1872. He was educated at Western Reserve University (A.B. 1892; A.M. 1894) and Yale (A.M. 1899). He was assistant editor of *Godey's Magazine*, *Current Literature* and *The Criterion*. He served on the Mexican border in 1916 with the rank of captain; in 1918 was promoted major, and after honourable discharge in 1919 was appointed major in the reserve corps. His works include *The Lakerim Club* (1898); *The Dozen From Lakerim* (1899); *Contemporary American Composers* (1900); *The Musical Guide* (1903); *Excuse Me!* (1911); *The Amiable Crimes of Dirk Memling* (1913); *The Thirteenth Commandment* (1916); *Long Ever Ago* (1919) and *What's the World Coming To?* (1920). Among his plays are *The Wooden Wedding* (1902); *Tommy Rot* (1902); *The Richest Girl in the World* (1906) and *Uncle Zab* (1913).

**HUGHES, SIR SAMUEL** (1853–1921), Canadian soldier and politician, was born at Darlington, Ont., Jan. 8 1853. His father was an Irishman and his mother of Scotch-Irish and Huguenot descent. From the age of 13 he belonged to the Canadian volunteer militia, with which he saw service in 1870 at the time of the Fenian raids. In 1873 he was gazetted to the 45th regiment. Educated at Toronto University, he became a lecturer in English at the Toronto Collegiate Institute and held that post until 1885, when he gave up teaching for journalism, being editor and proprietor of the *Lindsay Warder* from 1885 to 1897. In 1892 he was elected to the Dominion Parliament, but in 1899 he interrupted his political career to serve in the South African War, where he commanded a mixed force of English and colonial scouts in western Cape Colony. The year 1911 saw him in England, where he attended the coronation of George V. On his return to Canada he became Minister of Militia and Defence, and in that capacity was responsible for the creation of the Overseas force which in 1914 came over to take its share in the World War. In 1915 he was created K.C.B. and promoted major-general. But, in spite of his

strong personality, he was not easy to work with, and difficulties with Sir Robert Borden led to his sudden resignation of office in Nov. 1916. His health subsequently failed. In July 1921 he announced his intention of retiring from Parliament, and he died Aug. 24 1921.

**HUGHES, SPENCER LEIGH** (1858–1920), British journalist, was born at Trowbridge April 21 1858 and educated at Woodhouse Grove school near Leeds. For ten years he worked with an engineering firm near Ipswich, but joined the staff of the *Morning Leader* at its beginning, and for many years contributed the "Sub Rosa" column, which consisted of short witty paragraphs on current topics written from a Liberal standpoint. He was also connected from 1891 onwards with *The Star*. He was one of the cleverest after-dinner speakers of his time, and published a book on *The Art of Public Speaking* (1913), as well as *The English Character* (1912); *Things that Don't Count* (1916); *Press, Platform and Parliament* (1918), to a great extent autobiographical, and other essays, tales and sketches. After failures at Jarrow in 1907 and Bermondsey in 1910, he was elected to Parliament as a Liberal for Stockport (1910). He died after a long period of ill-health in London Feb. 22 1920.

**HUGHES, WILLIAM MORRIS** (1864– ), Australian statesman, was born in Wales Sept. 25 1864. He was educated at Llandudno grammar school and St. Stephen's Church of England school, Westminster, where he was trained as an elementary schoolmaster; but at the age of 20 he preferred to emigrate to Australia and to make his living as he could until he succeeded in entering political life as a member of the Labour party. This he achieved ten years later, being elected to the N.S.W. Legislature for one of the divisions of Sydney in 1894. He was also admitted to the N.S.W. bar. Though delicate in health and in later life handicapped by deafness, he showed from the first marked ability and fighting force. He organized the Maritime unions, became general secretary of the Wharf Labourers' Union and of the Waterside Workers' Federation, and president of the Carters' Union, and was reëlected to the Legislature at each successive election until he resigned upon his election for W. Sydney to the first Federal Parliament (1901). He first took office in 1904 as Minister for External Affairs. In 1907 he was a delegate to the Imperial Navigation Conference. The following year he was Attorney-General in Mr. Deakin's administration (1908–9) and held the same office under Mr. Fisher (1910–3), and again in his first War Cabinet (1914–6). On Mr. Fisher's resignation of the premiership in 1915 Mr. Hughes succeeded him and continued to hold office up to 1921.

He met, however, with considerable opposition, especially from the Labour party, who resented his advocacy of conscription (twice rejected on a referendum) and in 1917 refused to re-elect him as their leader. His own attitude towards the World War was vigorous and patriotic. He made a recruiting tour in 1915 through Great Britain, where he won a popularity perhaps greater than he enjoyed at home, and pledged himself to introduce conscription in Australia, though he failed to carry it. On his return to Australia in 1916 he was obliged to reconstruct his Cabinet and to effect a coalition with Mr. Cook, leaving out most of his previous colleagues of the Labour party. In Jan. 1918 he again formed a new Cabinet. As a member of the Imperial War Cabinet he was often in Europe. On his journey to Great Britain he made a speech in New York, May 31 1918, advocating the application of the Monroe doctrine to the South Pacific islands in the interests of Australia, and at the Paris Peace Conference of 1919, where he was the Australian representative, he objected to any authority over ex-German territory in these islands being granted to the League of Nations. In 1915 he was sworn of the Privy Council and in 1919 he became K.C. He published *The Case for Labour* and other pamphlets, and a collection of his speeches in Great Britain appeared in 1918. (*See further* AUSTRALIA.)

See Douglas Sladen, *From Boundary Rider to Prime Minister* (1916).

**HULL**, England (*see* 13.870).—Pop. (1911) 277,991, showing an increase during the decade of 37,732. The King George Dock situated E. of Alexandra Dock, with 53 ac. of water-space, is the largest on the N.E. coast and was opened in 1914. Both docks provide accommodation for the largest class of vessels and are equipped with graving docks, coal appliances, grain silos and warehouses, wool and transport sheds and the most modern appliances for general overseas trade; and they are directly served by railway at Alexandra Dock Station. An important addition to the facilities for the coal export trade was made in 1910 by the installation of coaling beds at the Victoria Dock; this method of shipping coal (the appliance for which has a capacity of 600 tons per hr.) had not previously been employed in England. Eastward of King George Dock is the Salt End deep-water jetty equipment for dealing with a large and growing oil import trade. The total water-area of Hull docks had reached 240 ac. in 1921, with a quayage of 13 miles.

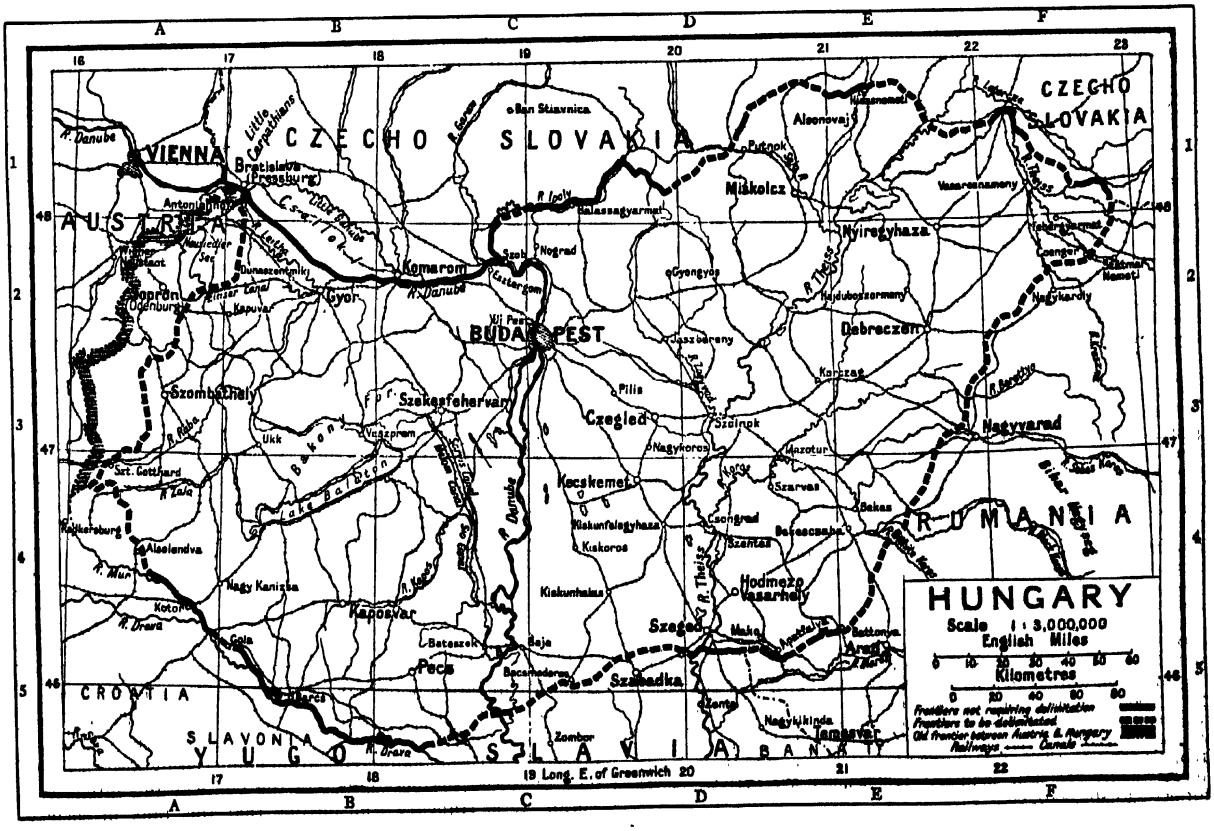
During the World War there was a very large development of the seed-crushing industry at Hull for oils of various kinds including that of the soya bean; very extensive mills were established by the British Oil and Cake Mills, Ltd., with a view to the development of the food supply and to taking advantage of the seed-oil trade diverted from certain continental countries. Castor oil, in particular, and lubricating oils for the use of Allied aircraft, were largely produced.

An art gallery was opened in 1910 by Mr. T. R. Ferens, M.P., who largely contributed to its erection and upkeep, and also presented 12 almshouses to the town in 1911 as a memorial to King Edward VII., and a playing field near the East Park. A new Guildhall has been built and a new museum designed to illustrate the shipping and fishing industries. A Municipal Training College for teachers, providing accommodation for 153 resident students, built at a total cost of £51,972, was opened in Sept. 1913 and the Newland high school for girls, with accommodation for 500 day scholars, was opened on May 20 1920; both buildings are erected on part of a site of 50 ac. N.W. of the town, purchased by the city council for £9,090 in 1908. In 1921 steps were being taken to transform the restored Old Grammar school, a fine example of 16th-century architecture, into a Museum and War Memorial so as to ensure its preservation; and the restoration of Holy Trinity church was completed. Among street improvements, the prolongation of Spring Bank west for a distance of ¾ m. in the direction of Willerby was the most important.

Hull suffered severely from Zeppelin raids. In that of June 6 1915, much damage was caused to commercial buildings and, on March 6 1916, in a raid by two Zeppelins, widespread havoc was done to house property and shops. Before a third raid in Aug. 1916, anti-aircraft defence had been organized and, though there were various subsequent attacks, they were mostly of the "tip-and-run" character and much less damage was done.

**HUMBERT, GEORGES LOUIS** (1862– ), French general, was born at Gazeran (Seine et Oise) on April 8 1862. He joined the ranks of the 20th regiment of Chasseurs in April 1880, and did not enter the military academy of St. Cyr until Oct. 1881. He was first commissioned (in Oct. 1883) in the 102nd infantry regiment. Two years later he was promoted lieutenant and was transferred to a native (Tonkin) unit, with which he first saw active service. He became a captain in June 1889, and shortly afterwards was again on active service in Madagascar. He was promoted lieutenant-colonel in Dec. 1902 and colonel (of the 96th infantry regiment) in June 1907. Five years later (March 1912) he was made a general of brigade, and in 1913 was sent to Morocco. On the outbreak of the World War he was given command of the 1st Moroccan division, which he held during the battle of the Marne. In Sept. 1914 he was made a temporary general of division. On Oct. 27 following he was confirmed in his rank and given command of the XXXII. Army Corps. On July 22 1915 he took over the III. Army—a command which he held continuously for four years, except for a small break Oct. 15 1918 to Oct. 23 1918—when he commanded the VII. Army. In Oct. 1919 he was appointed governor of Strassburg and commandant of the Alsace territory, and in the Jan. following was made a member of the Superior War Council. He was appointed a Grand Officer of the Legion of Honour on July 10 1918.

**HUME, ALLAN OCTAVIAN** (1829–1912), English ornithologist and Indian administrator, son of Joseph Hume (*see* 13.884), was born June 6 1829 and educated at Haileybury and London University. Entering the Indian civil service in 1849, he became collector of Etwah, and rendered distinguished service during the Mutiny and later against Firoz Shah. Between 1867 and 1871 he carried out the negotiations with the Rajput chiefs for



opening road and railway communications through the great belt of mountain and jungle which formerly cut India in two. He was made secretary to the Indian Government in the Home Department and afterwards in the Revenue and Agricultural departments, but returned to the North-West Provinces as member of the Revenue Board in 1879. In 1882 he retired from the service, and devoted himself to furthering the aspirations of native Indians. The Indian National Congress (*see* 14.417), which held its first session at Bombay in 1885, owes its existence to his exertions. He was the author of several works on ornithology, and presented his collections of bird skins and eggs to the British Museum. He died at Norwood July 31 1912.

See Sir W. Wedderburn, Bart., *Allan Octavian Hume, C.B.: Father of the Indian National Congress* (1913); and *Allan O. Hume: a Sketch of his Life and Services to India* (1912).

**HUMPERDINCK, ENGELBERT** (1854–1921), German musical composer (*see* 13.891), produced in 1897 the opera *Königskinder*, which, with some later additions, became very popular. Another opera, *Die Heirat wider Willen*, appeared at Berlin in 1905, and in 1912 Humperdinck produced the incidental music for the English production of *The Miracle*, himself coming to England to superintend the rehearsals. His last opera, *Die Marketenderin*, was played at Cologne in 1914. He died at Neu Strelitz Sept. 27 1921.

**HUNGARY** (*see* 13.894).—In consequence of the World War, Hungary was in 1921 only a remnant of what had been a thousand-year-old realm, large tracts of pre-war Hungary having been allotted on June 4 1920 by the Treaty of Versailles (Trianon) to its neighbours, Czechoslovakia, Rumania, Yugoslavia and Austria. The area of the old Hungarian state was 109,216 sq. m., of which only 35,184 sq. m. now remained to it. In the late summer of 1921 the boundaries of the State had not been definitely settled. The districts assigned by the Peace Treaty to Czechoslovakia, Rumania and Yugoslavia had already passed into their possession, and the county (*comitatus*) of Baranya, with the town of Pécs, which had been left to Hungary, had—with the exception of a few villages—been evacuated by the Yugoslavs, but the Burgenland (German Western Hungary), which had been assigned to Austria, was only in course of being handed over, a break-down in the arrangements occurring in August and September. The new boundaries are: on the N. the Danube E. of Pozsony (Pressburg), then the Ipoly (Eipel), whence it runs, regardless of natural features, partly between hills and mountains and partly across the Alföld (the central Hungarian plain); on the E. and S. along the Alföld the only part of the old southern frontier surviving being at its western end along the course of the Drava. The western frontier was shifted further E. at Hungary's expense.

*Population.*—Hungary had in 1910 a pop. of 20,886,487 of whom 9,945,000 were Hungarian and the remainder Rumanian, German, Serbian, Slovakian, Ruthenian, and Croatian; in 1920 the pop. was 7,481,951 of whom 6,612,000 were Hungarians, the remaining Hungarians having come under the rule of neighbouring States—Czechoslovakia with 1,084,000 Hungarian inhabitants, Rumania with 1,705,000, Yugoslavia with 458,000, and Austria with 80,000. In 1921 the pop. in Hungary was 88·4% Hungarian; 7% (521,344) German; 2·2% (165,886) Slovakian; it included also 41,000 Croatians, 48,000 Rumanians, and 22,000 Serbians. According to religion 4,700,000 (63%) were Roman Catholic, 1,597,000 (21·3%) Calvinistic, 463,000 (6·2%) Lutheran, 466,000 (6·2%) Jewish. Approximately 29·8% of the pop. dwelt in towns of over 10,000 inhabitants, while 70·2% dwelt in villages. The proportion of men to women was as 1,000 to 1,015. The birth-rate was high, but so also was the death-rate, which in 1910 was 23·6 per thousand. In 1919, out of 410,000, 63,000 died of tuberculosis, which is especially prevalent in the Alföld. During the World War Hungary lost over 600,000 men in the field; moreover from April 1915 to 1918 the number of deaths exceeded the number of births. In 1919 births exceeded deaths by 15,350. Emigration, the result partly of the exhaustion of the mines and the decline in handicrafts, due to the growth of industry in Austria, and partly of the rise in food prices, caused a serious drain on the population. That it was not due to persecution alone is shown by the fact that out of 790,068 emigrants in 1905–13, 577,001 belonged to the territory which Hungary lost by the Peace Treaty; thus the number of emigrants was considerable even in those parts of pre-war Hungary where there could be no question of Nationalist oppression. The main stream of emigrants was to the United States, and a certain proportion of these returned, the number between 1905 and 1913 being 213,542. After the conclusion of the war the emigrants rendered great services by sending over food and money.

The following large towns were ceded to neighbouring States—Pozsony (Pressburg), Komárom, Kassa (Kaschau), Kolozsvár (Klausenburg), Arad, Temesvár, Szabadka (Theresiopel), Nagyvárad (Grosswardein), and Sopron (Ödenburg). In addition to the capital Budapest, Hungary in 1921 still included among its chief towns Békéscsaba (pop. 42,600), Esztergom (17,881), Debreczen (92,729), Györ (44,300), Hódmezö-Vásárhely (62,445), Kalocsa (11,738), Kecskemét (66,834), Kiskünfóledyháza (34,924), Makó (34,918), Mezötúr (25,835), Miskolcz (51,459), Mohács (17,092), Nagy Kanizsa (26,524), Nyiregyháza (38,198), Pécs (49,822), Szeged (118,328), Székesfehérvár (36,625), Szombathely (30,947), Tokaj (5,105), Vácz (18,952); the figures being those of 1910.

*Agriculture.*—Hungary is preëminently an agricultural country; and in 1921 was still one of the principal wheat-growing regions of Europe. The Peace Treaty had, however, reduced the national area by much fertile soil. The comparative figures for the distribution of cultivation in 1913 and 1920 are as follows (in 1,000 ac.):—arable land (1913) 31,716 (1920) 13,598; gardens (1913) 941 (1920) 236; meadows (1913) 6,470 (1920) 1,627; vineyards (1913) 776 (1920) 530; pastures (1913) 8,183 (1920) 2,497; forests (1913) 17,977 (1920) 2,581; reedplots (1913) 125 (1920) 67.

Corn is the principal crop. The corresponding figures are (in tons):—wheat (1913) 4,028 (1920) 1,958; corn (1913) 1,221 (1920) 789; barley (1913) 1,484 (1920) 700; hay (1913) 1,236 (1920) 432; maize (1913) 4,136 (1920) 1,478; potatoes (1913) 5,074 (1920) 1,907.

The most famous wine-producing districts, Tokay-Hegyalja, Balaton and Eger, have been left to Hungary. Whereas pre-war Hungary produced annually 71,346,000 gal. the output in new Hungary was reduced to 43,524,800 gal. Only 114,000 (41 %) out of 284,000 ac. remained for the cultivation of sugar beet; only 82 % out of 71,000 ac. to tobacco growing; only 21,000 (26 %) out of 80,000 ac. to the cultivation of cabbage. Hungary retained 54 % of its oak forests, 42 % of its beech woods, and only 4 % of its coniferous trees, so that it became necessary to import timber.

As regards live stock there were 6,184,000 cattle in 1913, and 2,148,000 in 1920; swine had fallen from 7,311,000 to 3,729,000; horses from 1,597,000 to 746,000; sheep from 6,577,000 to 1,817,000. The proportion of animals to the population was thus much smaller in the new Hungary than it was formerly; whereas in pre-war times there were 33·9 cattle to every 100 inhabitants, in 1920 28·7; sheep were formerly 42·2, now 32·2; swine formerly 35·1, now 44·4; horses formerly 11·0, now 12·0.

This impoverishment was all the more important in that 56 % of the total population in 1920 was employed in agriculture. Pre-war Hungary exported, besides grain, a considerable amount of live stock; in 1913, 347,318 head of cattle; 46,567 horses; 893,192 pigs; 6,300,000 live fowl as well as 30·8 million lb. of slaughtered fowl; 77·9 million lb. of eggs; 61·5 million lb. of lard and bacon.

*Minerals.*—In consequence of the Peace Treaty Hungary has lost the greater part of its mines. Salt, opal, gold, silver, copper, lead and bauxite mines were entirely lost and only the iron-mines, which in pre-war times formed a quarter of Hungary's mining wealth, remained. Natural gas was discovered in Transylvania in 1912, and the supply appears to be almost unlimited, but the World War put a stop to the equipment of boring stations. These gas-fields passed into the possession of Rumania. Natural gas has been found in several places on the Alföld and in Transdanubia.

The annual pre-war production of the salt-mines was 245,500 tons, so that on their loss it became necessary to import salt to meet the home demand (98,000 tons). The petroleum output had been 6,400 tons. Of a former output of 1,178,000 tons of iron ore 196,000 tons were left as the produce of post-war Hungary; of 383,000 tons of iron, only 118,000 tons. Out of a former output of 1,077,000 tons of coal, one of only 786,000 tons (72·8 %) was left; and as this was chiefly obtained from the mines at Pécs which had in 1921 been for two years under the Yugoslav administration, the pre-war demand for imported coal was intensified. In 1914, 3,728,850 tons of pit coal were imported. The pre-war production of lignite was 7,846,000 tons, and 5,500,000 tons were produced in 1920.

*Industry.*—Hungary in 1921 had 2,029 factories (before the war, 4,241), with machines of 398,929 H.P. (before the war, 798,049) and 219,725 workers (before the war 445,792). The annual pre-war production was valued at 3,396,091,000 kronen (at pre-war rate of exchange). In 1921, on the basis of full work at the factories, the corresponding figures should have been 1,887,930,000 kr. but this figure was not attainable, since the coal supply was insufficient, and raw materials (which were chiefly derived before the war from the districts now ceded) could only be obtained by importation. If the production of post-war Hungary could be raised to peace-time level, the food industry would have an output estimated (at pre-war exchange) at 945,306,000 kr. (57 % of the former figure, 1,650,283,000), the iron and metal industry 252,388,000 kr. (50 % of the former 501,763,000), machine-making 250,680,000 kr. (82·1 % of the former 305,446,000), leather industry 44,975,000 kr. (57·6 % of the former 78,139,000), clothes manufacture 24,127,000 kr. (74 % of the former 32,320,000), paper industry 10,690,000 kr. (21 % of the former 49,542,000), timber industry 41,295,000 kr. (22·2 % of the former 186,268,000), textile industries 78,712,000 kr. (40·8 % of the former 192,977,000), chemical industry 126,029,000 kr. (54·7 % of the former 230,564,000), etc.

*Commerce.*—Pre-war Hungary had a favourable trade balance; in 1913 the exports were valued at 79·4 million pounds sterling, and imports at 86·4 million pounds sterling. No proper figures for 1920–1 can be given here, since the neighbouring States were still boycotting Hungary, and trade was therefore entirely abnormal.

*Communications.*—The total length of railway lines in 1921 amounted to 8,320 km. (formerly there were 19,723); the rolling-stock comprised 1,549 engines (formerly 4,949); 2,284 passenger carriages (formerly 8,718); 749 luggage vans (formerly 3,537); and 18,010 goods trucks (formerly 105,837). By the Peace Treaty Hungary lost its entire coast-line, and at the same time the whole of its mercantile marine, which amounted in 1914 to 412 sailing vessels (tonnage 1,837) and 137 steamers (tonnage 147,906). Inland shipping is greatly impeded by the fact that the Peace Treaty cut across the navigable rivers. The Treaty pronounced the Danube to be an international waterway, and Danube shipping is administered by an international commission.

The passengers carried by rail in 1913 numbered 166,100,000. Goods traffic amounted to 87 million tons, and the income derived from traffic to £24,500,000. As the express engines in post-war Hungary had to be driven by imported coal, the express service was very limited and fares extremely high.

*Banking.*—As the great banks of pre-war Hungary were chiefly seated at Budapest, the loss in this respect was not very great. Of 1,788 banks and savings banks, with capital of 2,164·4 million kr. (pre-war rate), Hungary retained 673, with a capital of 1,515·6 million kr. (*i.e.* 37·7 % of the institutions, but 70·1 % of the share capital). The share capital of the industrial joint-stock companies, formerly 1,059·3 million kr., amounted in 1921 to 828·5 million kr. (78·2 %). But owing to the terrible depreciation of the currency these sums had lost greatly in value on the world market. Between 1919–21 the value of the Hungarian krone fluctuated between 1 and 3 Swiss centimes, compared with a former value of 120.

*Finance.*—The first budget of reconstituted Hungary (1919–21) showed an estimate of 8·4 milliard kr. ordinary and 11·8 milliards extraordinary expenditure, as against 8·8 milliards ordinary and 1·7 extraordinary revenue; thus there was a deficit of 9·7 milliards, and this was increased by the loss of former sources of revenue (*e.g.* the State railways), on account of the surrender of rich districts. The National Debt in 1921 amounted to 61·4 milliard kr., of which 8 milliards dated back to the pre-war period, 32·7 to the years of war and 20·7 to the post-war period. The Peace Treaty declared that Hungary should be liable to pay indemnity and make reparation, but without naming a definite sum. The establishment of an independent State bank, simultaneously with the separation from the Austro-Hungarian bank, had already been begun in 1921.

*Education.*—Of the former 16,929 elementary schools 6,402 remained in post-war Hungary; of 2,229 kindergartens 828; of 532 "secondary schools" (*Bürgerschulen*) 237; of 187 *Gymnasien* 85; of 34 *Realschulen* 15. The universities of Budapest and Debreczen were left to Hungary, as also the polytechnic of Budapest; the university of Pozsony was taken over by the Czechs, that of Kolozsvar by the Rumanians. (J. S.*)

*Social Conditions.*—Up to quite recent times, the members of the Hungarian aristocracy, who were also known as "oligarchs," had continued to exercise an important influence on the destinies of their country. It has become the fashion to put the blame on them for everything that went wrong, but from an unprejudiced point of view such an accusation is unjust. The Hungarian aristocracy was ever loyal and ready to make sacrifices for the good of the nation. Many illustrious names are to be found in their ranks—mention need only be made of Szechényi, Batthyány and Andrássy. This aristocracy, distinguished by talent and culture, considered it the highest honour to serve their country whether in politics or in war, and the only just reproach that can be brought against them is that of having resisted too long the introduction of new elements into the constitution. For the most part, however, this attitude was due to tradition and to a fear that the politically untrained masses might prove a source of danger to the nation.

In this respect there was little difference between them and the upper middle classes, who played an important part in the history of Hungary, and had given to the country such notable men as the poet and politician Kölcsey, Louis Kossuth and Francis Deák. In the days of the Diet there were in Hungary 20 commoners to one nobleman; in 1856 the saying was, "He is not a Hungarian nobleman; what then is he to be?" As there was no real *bourgeoisie* in Hungary, it was replaced by the lower nobility, to which was applied the English term "gentry." Possessing a cosmopolitan education enhanced by foreign travel they produced the best minds in the political and intellectual world. It is Hungary's misfortune that this rank of society,

which was so important to the national culture and politics, especially in the second half of the 19th century, should have fallen into decay, due largely to the growth of extravagance and love of pleasure, and to a reluctance to learn, which was in marked contrast to the earlier days. The chief cause of this decadence was, indeed, the deterioration in their own standard of life. They suffered severely from the abrogation of the *urbarium* (dues paid by the peasants to their landlords), and from the fact that the method of indemnification at the time of the absolute government (during the 'fifties of the last century) was not one calculated to benefit the Hungarian nobleman in possession. To this must be added that the agrarian crisis of the last decades of the 19th century greatly impaired the smaller estates. The weakness of the lesser landowners rendered them incapable of absorbing the new Hungarian elements, so that they forfeited their intellectual leadership without achieving importance in the industrial sphere, where they had never played any part. Latterly the majority of the gentry, after being driven from their mismanaged estates, which had hitherto been the basis of their existence, found themselves almost entirely dependent on the public services; though deprived of landed possessions they remained proudly conscious of their class, and this prevented them from seeking a means of livelihood in other spheres. The Hungarian nobleman had always considered it beneath his dignity, exactly as in feudal Hungary before 1848, to occupy himself with commerce and industry; and as late as the 'seventies of the last century no girl belonging to the better classes would have been seen in Kolozvár (Klausenburg) walking in the streets, arm in arm with a mere business man. Exclusiveness and a domineering temper were the characteristics of the gentry, who were perhaps even prouder than the aristocracy, and in former days even avoided connexion with them by marriage. They did not desire to become baron, count or prince: good birth was of more value in their eyes than the most dazzling title.

When we come to the plain citizen class, it must be noted that they had never played so important a part historically in Hungary as in England, France, Germany and Italy. Characteristically enough, before 1848 all the towns of Hungary had together only two votes in the Diet. Pozsony (Pressburg), as the town where the coronation took place and the Diet met, occupied an outstanding position. At other times lonely and deserted, the tide of social life there ran high whenever the Diet assembled. The other towns, especially of western and upper Hungary, where German education was in the ascendant, had no influence on the intellectual progress of Hungary. The German population of the towns maintained a close intercourse with the Hungarian, from whom they borrowed new ideas, often absorbing at the same time their nationality and language. Many a leader of the Hungarian Liberal movement sprang from what were originally German middle-class families, and in the same way German cities became Hungarian. On the other hand the Saxons, who had settled in Transylvania and possessed autonomous institutions hallowed by tradition, which gave them political privileges, clung to their German nationality and acquired their education at German universities.

With the exception of the Transylvanian Saxon towns, which resembled those of mediaeval Germany, the Hungarian towns were for a long time merely large villages. Even in the early 'sixties of last century Pest was small, but little developed and badly paved. In those days a citizen of Pest who made a journey to Paris was an object of curiosity. In Debreczen, the "pearl of the Alföld" (the Hungarian central plain), when the season was wet, it was necessary to lay planks across the streets in order to make communication possible. No vehicle could pass along the roads without sinking halfway up the wheels in mud. It was not till after the *Ausgleich* with Austria of 1867 that a sudden development took place throughout the country. This is shown by a comparison of the increase in population of the different towns. In 1781 Pest had a pop. of 52,944; in 1869 it had 254,500, and in 1910 as many as 880,371 inhabitants. Pozsony (Pressburg), with a pop. of 26,898 in 1781, in 1910 had 78,223 inhabitants. Debreczen, with 20,153 in 1781, had 92,729 in 1910. The census of 1920 will have shown still higher figures, since the flow of population from the country to the towns had increased enormously, hand in hand with the development of industry, commerce and the means of communication. Those who knew Budapest, the capital, before the *Ausgleich* as a little town, found it just before the World War a stately European city of enormous dimensions. Within two or three decades everything there had undergone a change. Old-fashioned streets and indeed whole quarters were demolished to make room for broad thoroughfares and imposing buildings. Between 1870 and 1910 the number of houses increased from 9,351 to 19,637. Endeavours were made to remedy the lack of public gardens. A number of bridges, among them the grandiose and daringly conceived Elizabeth Bridge, and the world-famed suspension bridge, unite Pest with Ofen which is beautifully situated on the opposite bank. It was in the full swing of this great development that Budapest was struck down by Bolshevist rule and the Rumanian occupation.

As regards the working-classes, the origins of socialism in Hungary can be traced back to the year 1868. About this time the "Working-man's Paper" (*Munkások ujsága*), edited by Kunsági, made its appearance. This paper, which was of short duration, was succeeded by others, such as "The Golden Trumpet" (*Arany Trombita*) edited by Táncsics and the "Weekly Labour Chronicle" (*Munkás heti krônika*) edited from 1876–81 by Léon Frankel, who was at the head of the Ministry of Works at the time of the Paris Commune. This was followed in 1880 by the "Voice of the People" (*Népszava*), founded by Viktor Külföldy, which became the most powerful organ of the Hungarian Social Democratic party which from the outset was closely connected with international social democracy. Labour in Hungary had a centralized organization, with its headquarters at Budapest, whence the whole movement received its impetus. However, a split occurred in 1897 when Várkonyi founded the Independent Socialist party, and another in 1900 when Mezöfi began to lead the Reorganized Socialist party. Among these three parties the most successful were the Social Democrats, who organized an agricultural strike in 1897, with the result that the extraordinarily low wages—of often only 25 *heller* per day—were doubled and even trebled. After several Acts had been passed for the protection of labour, for instance that of 1891, the law of 1898 was passed, which aimed at the prevention of self-help and was called "the Law of Slaves" by the Socialists, since it made strikes illegal and compelled men to work at the point of the bayonet. But this did not suppress the movement. Its chief cause lay in the unequal division of land. A large part was owned by the rich landowners as estates—many possessing as much as 20,000 *Joch* (about 28,400 ac.)—whereas another part—known as Mortmain—was in the hands of the Church. As such conditions made it impossible for the proletariat to buy land of its own, and industry was not as yet developed enough to provide food and means of livelihood for the poor, many were forced to emigrate. It has been calculated that within 10 years more than 1½ millions left their own country in order to win for themselves across the Atlantic a new home and a more hopeful existence. Those who were left behind swelled the ranks of Social Democracy, which split up and formed several camps. All were organized and led by different leaders. But a common cry bound them together, to win the franchise, from which they were excluded. Their aim was to enter Parliament by this means and there to give weight to and defend their interests through their own representatives.

The earliest legislation dealing with electoral law in Hungary is to be found in Article 5 of the law of 1848. It was not until 1874 that the subject was again introduced, and Article 30 of that year was in reality a retrograde step, in that it imposed higher property and taxation qualifications than had been demanded in the ordinance of 1848. In spite of the notable increase in the population, the number of those entitled to vote was not greater than it had been in 1848—namely 700,000 to 800,000. Another period of inactivity followed. After the Electoral League had for some time been agitating for universal franchise the Delegate Vássonyi introduced a motion by

which a committee of 35 members should be set up to draft a law for the introduction of universal suffrage, to regulate the elections and to collect the necessary statistics. The importance of this proposal lay in the fact that it introduced the question of universal suffrage for the first time into the Hungarian Parliament, and from that time onwards till the outbreak of the revolution (Oct. 1918) it was always present on the Order of the Day. It was brought forward on behalf of the Government by Joseph Kristóffy (b. 1857), Minister of the Interior in the Fejerváry Cabinet, on July 28 1905, on the occasion of an address to a labour deputation. Kristóffy's electoral system gave the vote to 2,691,000 electors. This enfranchised all males over 24 years of age who were able to read and write. After Kristóffy each new Government had to bring forward a new programme of franchise reform. On April 10 1906, Alexander Wekerle, Minister-President of the Coalition Cabinet, declared himself in favour of universal suffrage, in agreement with the speech from the throne. On Nov. 12 Count Andrássy, as Minister of the Interior in this Cabinet, brought forward a plural voting law, which gave two to three votes according to an educational qualification. The party led by Justh, the radical wing of the Independence party who were opposed to the principle of plurality, left this party, and thus brought about the failure of Andrássy's scheme.

The Government of Count Khuen-Héderváry, which followed, completed the statistical preparations for a new electoral law. This was moved by Khuen's successor, Minister-President Ladislaus von Lukacs, but only carried by Stephen Tisza's Ministry, as the so-called "Lukacs-Tisza Electoral Law of 1913." It gave the vote to 1,627,000 electors, but was destined not to satisfy the supporters of radical reform. The secret ballot was restricted to a certain proportion of the electoral districts. Tisza himself recognized its weaknesses and the necessity of revision. In particular the industrial classes seemed at a disadvantage, since he had intended to widen their franchise considerably. Accordingly Tisza determined to remedy this when the new list of electors was compiled. When, however, Stephen Rakovszky, a member of the Catholic People's party, proposed to give the vote to all soldiers on active service by means of a supplementary amendment to the Electoral Law, Tisza protested most firmly against such a demand. He held that the franchise must not be regarded in the light of a reward, and that to accept Rakovszky's proposal would mean universal suffrage, which he regarded as inadmissible. Accordingly Rakovszky's motion was lost. On April 28 1917, however, the young King Charles announced in an autograph letter an extension of the franchise in consideration for the sacrifices made by the population during the war. Tisza however interpreted the royal letter in a manner which, according to the Opposition, was not in agreement with its contents and sense. Tisza would not yield, since in his opinion a radical franchise policy which outstripped the development of educational and economic policy would be a serious danger to the country and the dynasty alike. The Cabinet fell. In announcing his programme in Parliament on June 21 1917, Tisza's successor, Count Maurice Esterházy, declared electoral reform to be the chief plank in his platform, and said that he had undertaken to extend the franchise in the sense of the royal letter of April 28 and for the reasons given in this, keeping in mind at the same time the exigencies of the Hungarian State. When Tisza proposed, as a compromise, that for the time being only industrial workers should receive the vote, Count Apponyi refused, on behalf of the Government, to consider this. Vázsonyi, as Minister of Justice, strongly attacked Tisza, whose electoral reform of 1913 he described as a sham and denied that a democratic franchise would prove a danger to State or dynasty. Wekerle, Esterházy's successor, in putting forward his programme on Sept. 12 1917 also insisted on suffrage reform as the fundamental basis on which his Government would stand or fall. On Dec. 21 Dr. Vázsonyi, the Minister in charge of the Electoral Law, put forward before the House of Deputies the scheme announced by the Ministry on its formation. It provided, *inter alia*, that the franchise should be exercised by every Hungarian citizen, 24 years of age and over, who could read and write; by all who had received the military medal for courage or the military cross founded by King Charles (*Karl-Truppen-Kreuz*); by all who paid taxes amounting to at least 10 kr.; by all who had been on active service or attained the rank of non-commissioned officer, irrespective of length of service; or who followed a trade. Moreover all women were entitled to vote who were over 24 years of age; who were of Hungarian citizenship; who had passed through four forms of a secondary school, or attained a similar degree of education; whose husbands fell during the war or succumbed to their wounds, if there was a child; or who had for two years been members of a scientific, literary or artistic society. But the revolution of Oct. 1918 and Bolshevism revolutionized everything and imposed by force the rule of one class—the proletariat—on all ranks of society.

A sketch of social conditions in Hungary would be by no means complete, nor could its development be properly understood without some knowledge of the activity of the "Sociological Society" (*Tarsadalomtudományi Társaság*). It had a deep influence on the development of the ideas of the young generation of "Intellectuals." Its founders were followers of Prof. Julius Pikler's opinions on the solution of theoretical as well as of practical problems. The journal "The Twentieth Century" (*Huszadik század*) served as the organ of this society for the scientific discussion of social problems, and its columns were open to the free discussion of every question. It was the rallying point of from four to five thousand enthusiasts. At the same time the Galileo Club (*Galilei Kör*) was the centre for the contest which a section of the Budapest University students carried on against the Catholic congregationist unions. This club gradually developed into a students' Socialist organization, in which the Jewish element predominated. As a result of the distress caused by the war, which was severely felt by these young men, who were for the most part without means, anti-military and syndicalist doctrines spread in their ranks, and a few weeks before the outbreak of the Oct. Revolution of 1918 the police authorities found it necessary to suspend this club and arrest many of its members. The twenty-year-old "Intellectuals" of the communism which followed had all belonged to the Galileo Club, and, having nothing to lose and everything to gain, were prepared to go to any extremes.

The Jewish question has become important in Hungary. In 1785 there were 75,089 Jews in Hungary; in 1840, 241,632 (an increase largely due to immigrations from Galicia); in 1880, 730,342; and in 1910 as many as 932,458. This growth must be ascribed to their great wealth. Only half a century earlier than 1921 they were to be found in small towns and villages where they lived the isolated life of the ghetto. In time, as they grew rich through trade, the ghetto became too small for them. As they owned no land they were not tied to the soil, and streamed to larger cities, where they found more opportunities of making money and adding to their wealth. Above all Budapest, as the centre of commerce and industry and the seat of the banks, had a strong attraction for them. Three distinct classes of Jews grew up: the Orthodox, who wished to remain Jews with all the habits and customs of the ghetto; those who in most respects had relinquished their position of religious isolation and strove after assimilation, in opinions and culture, with the genuine Hungarian element, in so far as they had not already been so assimilated; and thirdly the cosmopolitan Jews, the revolutionaries, who were the enemies of national feeling and represented materialistic internationalism. It was the part played by this third class of Jews—not the action of those who had become partizans of Hungarian nationalism—which has made the Jewish question acute in Hungary. As Hungary has no true middle class, they exercised great influence on the intellectual life of the country, and without them its economic life, which was preponderantly in their hands, would have been condemned to stagnation.

*Language and Nationality.*—It has become customary to regard Hungary as the battleground of the nationalities inhabit-

ing it, in opposition to the Hungarian nation. In contrast to the majority of western European states Hungary has suffered from the lack of uniformity of language. The existence of a population speaking different tongues was due to several causes. The wars of the Magyars against invading enemies, which were continued through many centuries, caused heavy losses which could only be made up by the immigration of foreign settlers, who poured in in vast, ever-renewed numbers; and the admixture of languages due to this cause was increased by the Rascians, Serbs and a number of Wallachians, who fled from the Turks into Hungary, where they were hospitably received. There was no possibility of any fusion of these alien elements with the national Magyar stock, and the Magyar race showed no desire for such assimilation, regarding the matter with complete indifference. Indeed, so far from the Hungarians making any attempt to Magyarize their country, they were themselves in danger of Germanization, first under Joseph II. (1780–90) and later, after the national uprising of 1848–9, under the *régime* of the minister Bach. This danger was averted by the war of 1866 and the *Ausgleich* with Austria that followed. By the law of 1868 all citizens of the State domiciled in Hungary constituted, in the political sense, the indivisible, uniform Hungarian nation, of which all were members with equal rights, regardless of their nationality. Before the World War the Magyars numbered 10 millions in the whole of the kingdom of Hungary, constituting the majority of the population and therefore, in accordance with the Law of Nationalities of 1868, Hungarian (Magyar) was established as the official language for all, just as Latin had been in the days of the old Diet. When the elder Count Julius Andrássy was Minister-President, and under his immediate successors, who clung closely to this law, there was no Nationalist party and therefore no Nationalist question. The latter did not arise till after 1875, when Koloman Tisza, and still more Baron Bánffy, deviated from the Law of Nationalities and initiated a more chauvinistic Hungarian policy. This was, doubtless, a political mistake. Equally impolitic was the attempt in 1907 of Francis Kossuth, the Minister of Commerce, to make Hungarian the official language of the Croatian railways, and the action in 1909 of Count Apponyi, Minister of Education, in ordering the Magyar tongue to be used for religious instruction in the Ruman State schools. None of these efforts succeeded, and their only result was to create bad blood and to rouse complaints of oppression and persecution which found a sympathetic hearing abroad.

In spite of these specific grievances, which in any case were much exaggerated, all citizens of the Hungarian State, whatever their race or language, were guaranteed the full exercise of all their civic rights. Under the agreement of 1868 Croatia enjoyed full autonomy, with Croatian as its official language. It was to all intents and purposes independent, limited only, in the same way as Hungary, through the common army and common representation in the Delegations. The nationalities speaking languages other than Magyar had the right to build and maintain schools, and themselves to determine the language of instruction subject to the State language finding its proper place in the curriculum. In the school year 1912–3 there were 447 German, 377 Slovak, 2,233 Rumanian, 59 Ruthenian, 270 Croatian or Serbian elementary schools (not counting those in Croatia and Slavonia), which together made up one-fifth of all the elementary schools in Hungary. These Nationalist schools received a State subvention of nearly 14 million kronen. The prelates, both of the Greek-Uniate and the Greek Non-uniate confessions — metropolitans, archbishops and bishops — had by the end of the 17th and the beginning of the 18th century a seat in the Hungarian Upper House, as, for example, the Metropolitan of Karlowitz, the Rumanian Archbishop of Balázsfalva (Blasendorf) and the Rumanian Bishop of Nagyvárad (Grosswardein). On the other hand the prelates of the Protestant Church, which was wholly Magyar, only entered the Upper House 120 years later.

The nationalities had full freedom in the domain of the Church. At ecclesiastical functions, Rumanian was spoken exclusively in 3,322 parishes, Slovak in 1,029, German in 937 and other foreign languages in 832. It is significant, too, that between 1908–13 the Rumanians in Transylvania were able to acquire land to a value of 60 million kr. at the expense of the Hungarian population. The monetary institutions of the foreign nationalities were equally flourishing. A contrast is marked by the fact that the "Rumanian League of Culture" in Bucharest on March 28 1914 referred to the Rumanians in Transylvania as "oppressed brothers beyond the Carpathians," whose only hope, according to a resolution of 1913, lay in revolution. In Rumania, however, the domiciled Hungarians were permitted neither education nor religious service in their own tongue. The intercourse between Magyars and Slovaks furnishes an example of complete harmony. While the latter became Germans in Silesia and Czechs in Moravia, they were enabled to preserve their nationality intact in Hungary. The famous Cardinal Peter Pázmán (1570–1637), the father of Hungarian prose, saw to it that, as early as the 17th century, they could hear sermons in their own tongue at the church of Nagysombát (Tirmau). This harmony was not disturbed till it was pretended that the Hungarian Slovaks were lineal descendants of Svatopluk (d. 894); and a Slovak Protestant clergyman, who was entirely ignorant of history from the 10th to the 13th century, declared in 1821: "We, the Slovaks, are the heirs of this land, and the Hungarians mere foreigners." It can truly be said that the Magyars of pre-war Hungary knew of no national or religious differences, and, just as in 1848 the Magyar, German, Slovak and Rumanian serfs were all liberated at the same time and given the full exercise of political privileges, so after 1867 there was complete equality and freedom in religion and language. But the principle of State unity was strictly maintained, though efforts to undermine it were made in Croatia and the southern Slavonic districts, where the formation of a separate uniform Slav State was aimed at. This aspiration found its first expression in the Fiume resolution of 1906 which proclaimed the realization of the union of the Croats, Serbs and Southern Slavs. In 1916 the union of Croatia, Slavonia and Dalmatia with Bosnia and Herzegovina was demanded. Inspired by the idea of nationality which had developed during the 19th century some of the Rumans in Hungary also wished for union with the kingdom of Rumania. So long as the monarchy existed in its entirety such agitations had, of course, to be conducted in secret. The Slovaks rejected all the blandishments of the Czechs.

Many notable Hungarian politicians were in favour of an extremely liberal treatment of the non-Magyar population of Hungary. But, like Baron Joseph Eötvös, they dismissed the idea of national divisions by purely ethnographical districts, on the ground that this must lead to the dissolution of the State. On the other hand Hungarian politicians did not wish the other nationalities to feel themselves stepchildren on the soil of Hungary. In conformity with their whole trend of thought, it was their ambition that their nation, through its ethical and political hegemony, should prove the centre of attraction to the subject nationalities. But they always maintained, as Count Stephen Tisza declared on Jan. 24 1917, that in districts where different races and nationalities were intermingled it was impossible for each individual race to form a national State. That race must be in the ascendent, and give the impress of its character to the State, which preponderated in numbers and culture.

*Economics.*—Hungary, with its area of 324,851 sq. km. and pop. of 20,886,000 (according to the 1910 census), is economically one of nature's most favoured lands. As a patriotic Hungarian poet has said: "Were the earth God's hat, then Hungary would be the wreath that decked it." It is above all an agricultural country; it possesses valuable forest land and rich plains irrigated by great rivers, where the harvests are usually plentiful. A great step in the development of agriculture had been taken, when in 1848 the peasant became the free owner of his land. Under the influence of the defeat of 1849 the effects of this advance were lost, and progress remained at a standstill until after the *Ausgleich* with Austria in 1867, when a new period of economic prosperity set in. Among every 100 industrial workers 69 were employed in agriculture, which was conducted principally on extensive estates. Forestry occupies an important

place, in that 27·2 % of the area of the country is forest land, Hungary thus being very rich in timber. In 1879 the Forest Law was passed against indiscriminate exploitation of the forests, and from that time onwards it formed the basis of Hungarian forest policy. Thus a stop was put to the enormous waste of timber.

The most important use to which the land was put was corn-growing. Up to about 1881–91 the three-field system was customary; to-day it is no longer used and corn is grown intensively. Wheat is the chief product; from 1870–5 the average crop was 13,500,000 quarters, in 1912 it was already 50,250,000 qr.; the maize harvests in 1870–5 amounted to 12,169,000 qr., in 1912 to 52,325,000 qr. Oats and rye produce the smallest crop on account of the climate. The total value of cereals was estimated in 1878 at 1,408,000,000 kr., in 1912 at 3,055,000,000 kr. Wine is one of the most famous products, and above all Tokay.

Next in importance comes live-stock raising. In 1857 horses numbered 2,095,000, in 1911, 2,352,000; cattle in 1857, 5,647,000, in 1911, 7,319,000; swine in 1857, 4,505,000, in 1911, 7,580,000.

Hungary has been renowned for centuries for its mining and smelting; but after the opening-up of mines in America and Australia the importance of the gold-, silver- and copper-mining industries declined, while that of the coal-mines and iron-works proportionately increased. While in 1893 46,134 workers were employed in mining, before the war as many as 76,767 were so employed. The total proceeds from mining and smelting amounted to 53,000,000 kr. in 1864, and to 160,000,000 kr. in 1911. Salt is a State monopoly.

Though Hungary is essentially an agricultural country, it could, before the collapse of 1918, look back upon considerable industrial prosperity, although it never had the resources which would have made it an industrial State of any economic importance. After 1889 the Government did much to promote and encourage industry. Between 1890 and 1902, 537 undertakings received State aid. The distinguished Minister of Commerce, Gabriel de Baross (1848–92), brought about the systematic participation of home industries in State and army contracts. This policy was further developed by Joseph Szterényi, who after 1898 was the leader of the movement for the promotion of industry.

The most important group of Hungarian industries is that of food production, and here the mills have played the most important part. The first large steam mill was set up at the instigation of Count Stephen Széchenyi in 1839. There were in Hungary 147 steam mills in 1863; 492 in 1873; 1,908 in 1906 and later 2,040; water-power mills numbered 16,590. Second in importance is the sugar industry, which steadily developed after 1888, the number of factories rising from 21 to 28 during 1905–15. In 1913 1,701,675 *doppelzentners* of cane sugar were exported to Great Britain. After sugar come the iron and metal industries, which are among the oldest.

*Commerce.*—In 1890 the number of merchants in Hungary was 140,000; in 1910 they numbered 190,000, of whom 128,000 dealt in cattle, timber, mining and agricultural produce, and 62,000 in manufactures. In 1901, of the total national revenue 409 million kr. were derived from commerce, while in 1913 this had risen to 722 million kr. An idea of the general development of Hungary is given by its budget, which in 1868 amounted to 242 million kr., and in 1912 had risen to 1,856 million kr.

*Communications.*—The development of industry and commerce influenced the organization of communications. The first Railway Law was passed in Hungary in 1836. At the end of 1866 the network of railways covered 2,160 km., and there were only private railways. State management was not introduced till after 1867, when it had become evident that the private railway system ran counter to the economic interests of the nation. The period from 1876–91 saw nationalization, which was chiefly brought about by the minister Baross, who also introduced the epoch-making zone tariff. In 1912 the total length of railway lines was 21,910 kilometres.

In connexion with shipping it must be noticed that, whereas the river system of the Danube, of which most of the Hungarian rivers form a part, belongs to the Black Sea, a considerable part of Hungarian trade goes by way of the Adriatic, which is in nowise connected with the Danube system. The result is that there is little connexion between river and sea traffic, and this has its disadvantages. Steamers plied on the Danube between Vienna and Pest for the first time in 1825. Large sums were spent by the Hungarian Government on regulating river navigation. Special mention must be made of the navigation works on the lower Danube. The regulation of the Danube at the Iron Gates was of great value to the grain trade, since it used to be dependent on the favourable level of the water. In 1911 the waterways in Hungary navigable by steamers were 3,502·7 km. in length, of which 1,001·2 km. were on the Danube. In 1911 the tonnage of ships entering and leaving Budapest amounted to more than 25 million *meterzentners*. It had been planned to elaborate the commercial harbour of Budapest. In order to cope with the merchant traffic, freight ships maintained by the I.K.K. privileged Danube Steam Navigation Co. and the Royal Hungarian River and Sea Navigation Joint Stock Co. ply systematically on the Danube and its tributaries.

Hungary had a very short coast-line, on which the only notable port was Fiume, which, however, is not situated on the mouth of a great, navigable river such as would encourage mercantile traffic. Nevertheless Fiume was, and is, of great importance to Hungary in that it makes direct intercourse with international commerce possible. Between 1871 and 1911 the Hungarian Government spent about 51,500,000 kr. on improvements of the harbour of Fiume. Mention must be made of the Royal Hungarian Sea Navigation Co. Adria and also of the Hungarian Levant Sea Navigation Co. The Hungarian-Croatian Steam Navigation Co. was under contract with the Hungarian State.

The postal service of Hungary carried an average of 44 million letters between 1868–70, a number which had increased to 1,052 millions in 1912. Telegrams numbered 1,200,000 in 1868–70, and 13,980,000 in 1912. Hungary is in possession of an extensive local and interurban telephone system. The longest interurban lines are Budapest–Berlin (950 km.) and Budapest–Bucharest (896 km.).

*Education.*—The highest authority for public education is the Royal Hungarian Ministry for Culture and Education; State, Church and denominational schools are all under its control. The total number of elementary schools, Croatian excepted, amounted before the revolution to 16,861. The great poet and philosopher Baron Joseph Eötvös, Hungarian Minister of Education after the *Ausgleich* of 1867, made elementary education compulsory by the Elementary Schools Law of 1868. The number of illiterates was nevertheless great, especially in the districts inhabited by Rumans, Slovaks, Ruthenes, Serbs and Croats. The Minister of Education, Albert von Berzeviczy, laid down in 1905 a new curriculum for the Hungarian elementary schools. Special attention was paid by the State to the training of teachers. The *Bürgerschule* is a modern institution, especially designed for the children of the lower middle classes, who receive there a general and practical education. The fifth and sixth forms were recently adapted for agricultural tuition. These schools were attended by 43,000 boys and 57,000 girls, and these for the most part become the pupils of the intermediate technical schools. There are also girls' high-schools which also serve as teachers' seminaries. In 1910–11 there were 35 such schools, numbering 6,318 pupils and 434 male and female teachers. The higher secondary schools (*Gymnasien* and *Realschulen*) were critically affected by the passage of the Higher Secondary School Law of 1883, under the Minister of Education, August de Trefort, who had done much for the schools and Hungarian education in general. Only teachers with State diplomas are allowed to teach in these schools. In the *Gymnasien* Latin is taught from the first and Greek from the fifth form. There are 188 *Gymnasien* and only 34 *Realschulen;* accordingly the number of pupils in the former average 65,000, and in the latter 11,000. The cause of this is the preponderance of law students in Hungary. Those intending to teach in *Gymnasien* and *Realschulen* receive their training at special training colleges. The ranks of the teachers in the higher secondary schools are reinforced from the Eötvös College—an institution similar to the École Normale Supérieure at Paris—to which only the best pupils are admitted after careful selection. There they receive board and lodging, some paying the whole cost, some half and others nothing. Mention must here be made of the Board of Education founded in 1871 and reorganized in 1896, which deals specially with educational reform.

To the two existing universities of Budapest and Kolozsvár (Klausenburg in Transylvania) were added in 1914 the universities of Pozsony (Pressburg) and Debreczen. Besides these Hungary possesses one polytechnical institute in Budapest, 10 schools of law and 44 theological academies, and one Jewish rabbinical seminary. The greatest number of students—7,808—attended the university of Budapest in the winter session 1912–3. A change which was introduced in 1896 by the former Minister of Education, Baron Julius de Wlassic (b. 1852), opened the university to some extent to women. Accordingly, as they could not attend the university without having obtained the leaving certificate of the higher secondary schools, the Hungarian Women's National Educational Union founded a girls' *Gymnasium* of eight forms, which was followed by two others.

Mention should also be made of the technical schools. Hungary had 7 higher and 52 lower agricultural schools. In 1913 there were 4 commercial colleges and 54 higher commercial schools as well as 58 special commercial courses for women.

## History (1910–1921)

The "Coalition" which, under Wekerle's leadership, had taken over the Government in April 1906 was made up of elements too heterogeneous to enable it to satisfy the excessive hopes and expectations to which its advent to power had given rise. It fell to pieces owing to quarrels about the establishment of an independent Hungarian Bank, to take the place of the common Austro-Hungarian Bank, and to the refusal of the Crown to make further concessions to Magyar national sentiment in the matter of the army. After manifold negotiations Francis Joseph, as King of Hungary, on Jan. 11 1910 appointed Count Khuen-Héderváry Minister-President.

*Khuen-Héderváry Cabinet.*—On Feb. 14 Count Julius Andrássy, whom Count Khuen had vainly attempted to win over to his side, dissolved the Constitutional party of which he had

hitherto been the leader and declared that he would not actively oppose the Government. On the following day 24 members of the Constitutional party joined the supporters of the Government. Under the leadership of Count Stephen Tisza, on Feb. 19 1910, the National Party of Work (*Nemzeti munkapart*) was formed as the direct successor of the Liberal party established in 1875 by Coloman Tisza. There followed scenes of extraordinary violence provoked by the Opposition in Parliament, which was dissolved before its time by a speech from the throne on March 22. In the general election that followed in June Count Khuen-Héderváry was surprisingly successful; for of the 413 members returned 255 belonged to the party of the Government. The parties of Justh and Francis Kossuth were wiped out—the parties which aimed at bringing the army under parliamentary authority, which were working for the separation of Hungary from Austria, and whose programme included the establishment of an independent Hungarian Bank. Fresh life was put into the party of 1867 which for decades had determined the fate of Hungary.

The speech from the throne, with which the new Parliament was opened on July 25, proclaimed as one of the most urgent tasks it would have to face the reform of the franchise in such a way as to safeguard the uniform national character and the democratic development of the State. In the debate on the address the prime minister defended himself against the charge that he was pursuing a policy of abnegation, and that he was attempting to restore the disturbed harmony between the King and the nation by the surrender of all national aims. At the same time he announced that it would be necessary to increase the Hungarian army in proportion to those of the Great Powers. In Nov. the civil code was finally adopted. On Dec. 1 the Minister of Finance laid before Parliament a convention for the extension of the privilege of the Bank, which lapsed on Dec. 31 1910, and on the resumption of payment in specie. On Dec. 13 Parliament adopted by a large majority the provisional budget, up to April 1 1911. In general it can be said of the year 1910 that it was for Hungary a year of gradual internal consolidation. That the project of raising in March a loan of 560,000,000 kr. in Paris broke down was due to political reasons, since there was an objection there to lending money to a member of the Triple Alliance. But, after the signature of the commercial treaty with Serbia on Jan. 10 1911, a loan floated on the German money market (Jan. 13) met with immense success. It may be reckoned as a result of the promises made in the speech from the throne in 1910 that on May 2, at Bonyhad, a general meeting of the Hungarian Peasants' League, which was attended by 6,000 small cultivators from 181 communes, passed a resolution pledging support to any political movement aiming at securing universal, equal and secret suffrage.

After several days of obstruction Parliament began to debate the question of the reform of the defence force, which was met by the party of Kossuth and Justh and by the People's party by obstructive tactics carried to an extreme of technical perfection. This obstruction, which lasted for several months, led on Nov. 3 to the resignation of the president of the House of Deputies, Albert von Berzeviczy, who had been severely criticized for his mild interpretation of the rules of the House, the vice-president, Navay, being elected in his stead. On Nov. 8 the Opposition, under Count Julius Andrássy, declared itself ready to discuss the budget for 1912, to drop its technical obstruction of the Defence bill, and to debate it on two days a week during the discussion of the budget. The estimated expenditure under the budget for 1912 was increased from 1,706,544,999 kr. to 1,852,747,661 kr., the latter sum being the estimated receipts.

The effect of the alliance with Germany was illustrated during the year 1911 by the introduction of the German language as a compulsory subject in the teachers' training colleges, a rule which came into effect on Sept. 1. In view of the outbreak of the war between Turkey and Italy, Count Apponyi, on Oct. 11, interpellated the prime minister as to the attitude of Austria-Hungary, urging the duty of the neutral Powers to offer their mediation under the Hague conventions of 1899 and 1907; and at the meeting of the Hungarian Delegation on Dec. 29 he proposed that Hungarian public opinion should make it clear that the preservation of peace was the loadstar of Hungary's policy, and should declare itself, from this point of view, unalterably attached to the tried principles of Hungary's traditional foreign policy. The internal situation, however, gave little promise of peace. The hostile attitude of Croatia had, so early as Feb. 1911, given rise to stormy scenes in the Hungarian Parliament. On Feb. 6 the deputy Polonyi accused Dr. Tomačić, the Ban of Croatia, of making unconstitutional statements to the Croatian Diet as part of a deliberate policy. At Agram, from Aug. 12 to 16, there was held a great Pan-Slav gymnastic festival, which was attended by over 5,000 members of *Sokols* from Austria-Hungary, Serbia, Bulgaria, Russia and America. On Nov. 7 the Croatian Diet was dissolved by royal rescript, on the ground that it had not fulfilled the expectations with which it had been summoned, and that no further fruitful activity was to be expected of it. The Hungarian press fulminated against the administrative methods of the Ban, whom it accused of introducing into Croatia a reign of terror prejudicial to the good name of Hungary. At the new elections to the Diet 67 members were returned by the five groups of the Opposition, 27 by the party attached to the Government. The anti-Magyar party of the Right increased its representation from 14 to 25.

*The Army Question.*—At the outset of the year 1912 it seemed as though a peaceful atmosphere would prevail in Parliament. On Jan. 22 Count Apponyi announced the conditions on which the Kossuth party would sever its connexion with the Opposition, viz. (1) settlement of the question of flags and military emblems in accordance with the rights of Hungary as a State; (2) expunging from the military penal code of all regulations connected with the use of the German language; (3) redrafting of the individual paragraphs of the Defence bill; (4) an interpretation of Article 18 of the law of 1888 concerning the calling-up of the reserves and special reserves (*Ersatz-Reservisten*). In view of the perilous situation in the Balkans, Count Andrássy urgently appealed to the majority of the House and to the Opposition not to drive matters in connexion with the Defence bill to extremes and urged the Government to accept Apponyi's four points. Of these the most contentious was the article of the law of 1888, to which par. 43 of the Defence bill referred. The Kossuth party demanded pledges from the Crown that, in the event of its again finding itself, as in 1905, faced with a hostile majority in Parliament, it would not have recourse to a prorogation and to the expedient of meeting the refusal to vote the quota of recruits by calling the reserves and special reserves to the colours. The Opposition saw in Article 18 of the law of 1888 a handle for the Crown to nullify the right of Parliament to vote the annual quota of recruits, and for this reason wished to introduce into the new Defence bill specific provisions making such a course impossible. The prime minister took up the position that in this matter the Government and the Opposition were of one opinion, and it was therefore decided that the Party of Work should propose a resolution calculated to placate the Kossuth party. But this was not the opinion of the heir to the throne, the Archduke Francis Ferdinand, nor of the Austro-Hungarian Minister of War, Ritter von Auffenberg, who saw in this an infringement of the rights of the Crown. The King-Emperor himself shared this view, and the situation became so strained that a crisis involving the whole State was expected. Francis Joseph, in an interview with Count Khuen-Héderváry, declared that he would rather abdicate than submit to the proposed resolution. The only way to avoid the disastrous shock which the carrying-out of this resolve would infallibly have caused seemed to the prime minister to be that he himself should resign. On March 7, accordingly, he handed in his resignation, which was not, however, accepted. On March 30 Francis Joseph addressed to him an autograph letter, in which he expressed his deep regret at the differences of opinion which existed as to the rights of the Crown. It was far from his intention to dispute the constitutional powers of the nation, of which the right to vote the quota of recruits was one. But he, too, as

King of Hungary, had firmly to maintain the sovereign rights assigned to him by Article 18 of the Defence Law of 1888, which empowered him, in case of necessity, to summon to the colours and to dismiss the reserves and special reserves. He earnestly exhorted the nation to make this double task easier for him, in order to clear the way for those constitutional labours which depended for their fruition upon a good understanding between the King and the nation. Count Khuen-Héderváry accepted the King's view of the resolution which had been projected with his consent, and agreed to remain in office.

*Lukacs Ministry.*—Peace, however, was not restored. The Justh party, which represented the extreme wing of the Opposition, insisted that the crisis could only be definitely closed if the Defence bill were shelved and electoral reform given the first place on the parliamentary programme. As Khuen-Héderváry no longer commanded a following sufficient to enable him to carry the Defence bill, with its considerable increase in the number of recruits, he was forced to resign on April 16 1912. He was succeeded by Ladislaus von Lukacs, hitherto Minister of Finance, who had said that, if everything else failed, force must be met by force. In a stormy session, on May 22, Count Stephen Tisza was elected president of the House of Deputies in succession to Navay—a symptom of the decidedly bellicose temper of the majority. The new president lost no time in doing what had been expected of him. With the fearlessness and iron energy characteristic of him he succeeded on June 4 in carrying the Defence bill through the House, amid scenes of violent uproar. At his orders the police entered the House and removed the deputies of the Opposition. Members who had been suspended, but defiantly attended the House, Tisza ordered to be thrown out by the police. The deputy Julius Kovacs, who for breaches of order had been suspended for 30 sittings, entered the House on June 7 with the cry "There is still one member of the Opposition," fired at Count Tisza, but without wounding him, and then shot himself. The Count remained utterly unmoved, and continued the session as though nothing had happened. But the House could only debate under armed protection; it was frequently prorogued; and in these circumstances little could be done to restore wholesome conditions.

In Croatia, too, the year 1912 was one of disorder. The newly elected Diet met on Feb. 7 only to be immediately dissolved. The newly nominated Ban, Eduard von Cuvay, tried to suppress the disorders in Agram with an iron hand. In April the constitution was suspended; and several unsuccessful attempts were made during the year to assassinate Cuvay, who had been armed with the powers of a commissioner of the Crown.

The year 1912 witnessed the death of two notable Hungarians, the aged Gen. Görgey, who died on Dec. 17, and Count Albin Czaky, one of the creators of the political reform of the Church, who died on Dec. 15. At the close of the year the Government introduced into Parliament the projected Franchise bill, for which urgency had so long been pleaded.

When, after several days' interval, the Hungarian House of Deputies again met under police protection, Zoltan Désy, a former secretary of state and now a deputy, brought an action for libel against the prime minister Lukacs. The Budapest court acquitted Désy of the charge of slander brought against him by Lukacs, on the ground that he had proved that Lukacs in 1910, in connexion with the conclusion of agreements with the Hungarian Bank and Joint Stock Co., had accepted more than 3,000,000 kr., not indeed for himself but for party purposes, which was contrary to good morals. This was a sentence of condemnation on the Lukacs Cabinet; and on June 5 Tisza was appointed prime minister.

*Tisza Ministry.*—With the same unbending will with which, as president of Parliament, he had conducted the business of the House, Tisza now conducted the affairs of the nation in the face of unceasing protests on the part of the Opposition. He saw a further means of strengthening his system of government in securing State control of the administration of the counties (*comitatus*), which had hitherto been in the hands of elected officials; for if these were nominated, they would be entirely dependent upon the Government. This attempt at monopoly by the Government party was met with violent protests on the part of the Opposition, which was still further embittered by the consciousness that the King no longer stood as ruler above parties. As for Tisza, he set no limits to his will when he believed that the interests of the State demanded that it should prevail. Believing as he did that peace would be imperilled if the opinion gained ground abroad that the military power of the Dual Monarchy was broken, he carried a motion through the House of Deputies on Jan. 28, raising the contingent of recruits by 31,300 men, of whom 13,676 were to be drawn from Hungary. While the Government succeeded in raising a loan in London, the first for several years on the English market, Tisza tried to come to an accommodation with the Hungarian Rumans in the matter of their national claims. He declared publicly that the system hitherto pursued of enforcing Magyar only as the language of teaching in the schools had been mistaken, and that more attention must therefore be paid to the demand for instruction in the mother tongue. The Rumanian National Committee, however, refused to agree to Tisza's proposals. The refusal was, indeed, couched in conciliatory terms which left the door to future negotiations open. The door was slammed as the result of a bomb-explosion in the episcopal palace of Debreczen on Feb. 3, which raised a storm in Parliament and in the press. The outrage—which happily was unsuccessful—was directed against the life of the Greek-Uniat Bishop Miklossy, who in the controversy as to the use of Rumanian or Magyar in the liturgy had declared in favour of Magyar. For this outrage the Rumanians were blamed, and at the same time the opinion gained ground that the originators of this unsuccessful attempt at murder were tools of Slav agitation. In any case, the discussions as to those responsible for the crime caused bitter feeling between the Hungarians and Rumanians. On March 28 there was a hostile demonstration of the "Rumanian Culture League" at Bucharest against Hungary, and at the same time the Rumanians of Transylvania were celebrated there as "our oppressed brethren beyond the Carpathians," which led to sharp rejoinders in the press.

*Hungary and the World War.*—Into the midst of these squabbles, and just as Tisza was accusing the Opposition of publicly proclaiming their support of the Triple Alliance and at the same time playing into the hands of its enemies, there came suddenly, on June 28 1914, the news of the murder of the Archduke Francis Ferdinand and his wife at Sarajevo. In Hungary the death of the Archduke was felt as a relief. His dislike of the Magyars was well known, and also his objection to the system of Dualism. In truth, his aim had been nothing less than the overthrow of the form of the State as constituted by law. In the political systems which he from time to time favoured—whether Trialism or a Federalism—he had assigned an important political rôle to the nationalities living in Hungary, and always in an anti-Magyar sense. Exactly a month after the Sarajevo crime Austria-Hungary declared war on Serbia (July 28), and the Hungarian Parliament was prorogued for an indefinite period. When it met again, on Nov. 30, its attitude was that of an unexpressed vote of confidence, and, after the storm and stress of the last years, gave the impression of "a magnificent symphony"—to quote the *Budapesti Hirlap*.

It was only now, during the war, that a series of grievances, which had raised the most violent disturbances in Parliament, were settled in the sense of the Opposition. A decree of the Minister of the Interior, issued on Nov. 7 1914, authorized the wearing of the colours and emblems of the various nationalities, provided these were not identical with those of foreign countries and that the idea of the Hungarian State was also symbolized. The Government published the correspondence of Tisza with the Metropolitan of Hermannstadt in Transylvania, in which a reform of the National Schools Law was promised in order to meet the wishes of the non-Magyar inhabitants of the kingdom in the matter of the denominational schools. It was also decided to legalize the use of the mother tongue in direct intercourse with State officials. Finally, a prospect was held out of a

reform of the franchise with a view to putting the representation of the Rumanians on a just basis. On April 19 1915 Parliament, which would have come to an end on the following July 15, passed a bill extending its life for another year. In Oct. the question of the coat-of-arms and flag of the Dual Monarchy, the settling of which had been blocked by the Archduke Francis Ferdinand, and which for decades had been the worry and distraction of every Government in turn, was at last arranged. For all matters of common concern a coat-of-arms was devised which actually symbolized the constitutional relations of the two halves of the Dual Monarchy. The quartering on the same shield of the arms of Hungary and Austria proclaimed their essential independence, and the name of Austrian Empire was now officially adopted by the cis-Leithan half of the monarchy in place of the style "the Territories represented in the *Reichsrat*." The escutcheon of the House of Habsburg surmounting the two shields, on the other hand, symbolized the fact that the two states were united, this being still further emphasized by the motto *indivisibiliter ac inseparabiliter*, borrowed from the Pragmatic Sanction. In the same spirit the question of the flag was settled. The old black-and-yellow flag of the common army was replaced by an ensign in which white alternated with black and yellow, with red, white and green "flames," and which was further ornamented with the new arms of the common State surmounted by the Imperial crown and the crown of St. Stephen.

A settlement thus seemed to have been effected of all the quarrels which had weakened the monarchy, whether arising out of the internal affairs of Hungary or her relations with Austria. When on Sept. 2 1916 the Hungarian and Croatian municipalities took the oath of allegiance to the Emperor-King at the palace of Schönbrunn, the Ban of Croatia, Baron Skerlecz, said that this was the day of victory for all the fundamental principles on which the structure of the monarchy rested; and the speeches delivered on this occasion, both by Hungarian and Austrian representatives, gave eloquent expression to the deep sense of essential unity which had been called forth by the danger to the monarchy arising out of the war. In the internal affairs of Hungary, too, the Opposition wished to secure "concentration" by means of a Coalition Ministry, hoping in this way to avoid a repetition of what it conceived to be mistakes in Hungarian foreign policy. On May 20 1915 Count Apponyi proposed that a Coalition Government should be formed of members of the Opposition and of the actual Cabinet; that the prime minister should be a member of this Government, but that at its head should be placed a statesman whose neutrality should be guaranteed by the fact that he had taken no part in recent party contests. But Tisza was by no means disposed to submit himself to the headsman. He believed himself to be indispensable at the head of affairs in Hungary at a time when the failure to prevent Italy entering the war on the side of the Entente was ascribed to the inexcusable blundering of the Austro-Hungarian Foreign Office. He declared that he could with a clear conscience accept responsibility for whatever influence had been exercised by the Hungarian Government upon foreign affairs. And so the idea of a Coalition came to nothing.

Two months later, on Nov. 21 1916, the long reign of Francis Joseph came to an end. Ever since his coronation, on June 8 1868, as King of Hungary he had never ceased to feel and act as the constitutional ruler of the country, and he had faithfully adhered to the spirit of the *Ausgleich* of 1867. The gratitude of the nation was expressed in a resolution passed by Parliament on Jan. 22 1917 to erect a fitting memorial to him in Budapest. The collapse of the monarchy in ruins prevented this resolution from being carried out.

*Accession of Charles IV.*—Francis Joseph's successor, who assumed the style of Charles I. as Emperor of Austria and Charles IV. as King of Hungary, was crowned, together with his consort, on Dec. 30 1916, after he had, in accordance with the constitution, signed the "inaugural diploma" guaranteeing the rights of the nation. This ceremony, which under the Hungarian constitution was the indispensable condition precedent to the exercise by the King of any of his powers, was heralded by violent scenes in Parliament. The kings of Hungary were crowned by the primate and by a "vice-palatine" elected *ad hoc* by the Parliament. Count Tisza was ambitious of fulfilling the latter function and was duly elected by the parliamentary majority, while the opposition, under Andrássy's leadership, put forward the Archduke Joseph. To have thus put himself into opposition to the Archduke, who was not only popular but reverenced as a prince of the Hungarian royal house, was a mistake on the part of Tisza. It gave his opponents an opportunity of impressing upon the young sovereign that Tisza's violence would not always be content with shoving an Archduke aside. Equally strong was the impression made upon the royal couple, whose opinions were strongly clerical, by the suggestion that Tisza's behaviour was characteristic of the arrogance of this Calvinist, who presumed to crown the Apostolic King. As constitutional monarch Charles had to confirm the election of Tisza as vice-palatine, but it can safely be affirmed that this episode still more firmly rooted the dislike with which, as a Calvinist, he was already regarded at court.

At this time the negotiations for the economic *Ausgleich* between Austria and Hungary once more reached an acute stage. According to Article 25 of the treaty these negotiations for a new agreement, to cover the period from Jan. 1 1918, should have begun not later than the commencement of 1915, but it was not till Sept. 26 1915 that the two Governments took the matter in hand. As there was also a possibility of a tariff arrangement with Germany, wide support was given in 1917 to the idea of concluding an *Ausgleich* between the two halves of the monarchy which should cover a considerable period, say 20 or 25 years. It was thought that this would give a strong basis for the negotiations with the German Empire, and that it would save Austria-Hungary from the violent quarrels about the *Ausgleich*, which recurred every 10 years, and often produced abroad the false impression that the monarchy was falling to pieces. There never was a new *Ausgleich*, however, the last being that of 1907.

The Opposition in Parliament shared the strong dislike of the court for Count Tisza. On Feb. 26 1917 his motion for bestowing extraordinary powers on the Government for the duration of the war was opposed by Count Julius Andrássy, who saw in this an attempt on the part of the Cabinet to subject the whole country to the discipline of a single party, and denounced the imperialism of the Party of Work, which was extending even to Austria, where great bitterness was being aroused owing to the refusal of Hungary to supply food-stuffs. The interests of Hungary, Andrássy insisted, demanded a strong Austria alongside of a strong Hungary. In spite of this opposition, however, extraordinary powers were voted to the Government on March 23 by a majority of 93 to 63. On April 13 Tisza delivered a bitter attack on the Opposition, whose demand for a Coalition Government he denounced as a mere party cry, and whose object he declared to be not "concentration" but disorganization. On the following day the breach was complete. Tisza attempted to strengthen his Cabinet by inviting two members of Andrássy's Constitutional party to join it, but after consultation with their leaders they refused. Neither this attempt, nor an autograph letter of April 28 in which the King assured him of his confidence, could avert his fall—distrust of him at court was too deep-rooted. The immediate cause of his fall was the demand of King Charles that every holder of the military cross named after him (*Karl-Truppen-Kreuz*), *i.e.* every soldier who had actually served at the front, should be given the vote. On Tisza's refusal to agree to a policy in contradiction with that outlined in the autograph letter of April 28, he received his dismissal (May 23 1917).

*Esterhazy and Wekerle Cabinets.*—The proper thing to have done now would have been to have entrusted the formation of a Government to Count Andrássy, as the most conspicuous member of an Opposition which rested on the principles of 1867. Charles, however, thought it advisable to employ young blood in inaugurating the policy which he believed to be necessary in view of the tendencies of the times, and on June 15 he placed the

young Count Maurice Esterhazy at the head of the Ministry. The Count had the reputation of being a very intelligent, gifted magnate, but it was felt that to fit him for such a position it would have been necessary that he should have at least won his spurs as a politician. Tisza was now leader of the Opposition, and he was at the head of a blindly devoted majority. The strongest member of the Esterhazy Government was Dr. William Vazsonyi, a former lawyer who represented the Socialist party in the Cabinet and was appointed Minister of Justice. To him was entrusted the task of bringing before the House proposals for electoral reform in accordance with the new spirit of the times. He had scarcely drafted the bill before every sub-section of it became the object of unworthy chaffering. Even Count Michael Karolyi, who had posed as one of the most zealous champions of far-reaching democratic ideas, is said to have expressed his willingness to oppose the enfranchisement of illiterates in return for the appointment of a member of his party as Secretary of State in the Ministry of Justice. When it was obvious that the members of the Government were in violent disagreement among themselves, and Esterhazy's health broke down under the strain, it became necessary to find another prime minister. On the advice of Count Czernin, the Austro-Hungarian Minister for Foreign Affairs, Alexander Wekerle was appointed on Aug. 20. He had held the office several times before, was distinguished for his financial ability, and, in spite of his mistakes in the past, had the reputation of possessing one of the wisest heads in Hungary. But the task imposed upon him was beyond his powers. The situation had been rendered more difficult by the failure of the State to provide Austria-Hungary with bread-stuffs by taking over the rich harvest of 1917, with the result that forestallers and war profiteers had hastened to buy it up and withdraw it from the market. Wekerle soon tendered his resignation; but, on the failure of the Minister of Finance, Szterenyi, to form a new Cabinet, he consented to remain in office. The members of the Cabinet who had urged the immediate settlement of the franchise question—Apponyi, Esterhazy, Bela Földes and Vazsonyi—now retired.

*The End of the Monarchy.*—The whole political life of Hungary was sick, owing, on the one hand, to the opposition of Tisza to the radical reform of the franchise projected by Vazsonyi, and, on the other hand, to the ambition of Count Karolyi, who wished to get into office at any cost. The latter was not particularly gifted, and was more of an intriguer than a statesman; but he had been thrust into the foreground by the Opposition, which used this popularity-hunting aristocrat as a battering-ram to break down obstacles that stood in the way of their plans, and the part he was called on to play had turned his head. He really believed that his destiny was to shape the fate of Hungary, and his whole soul was intent on becoming Minister-President. Karolyi did not disguise his opinion that in politics all means are legitimate, if they lead to power. While assuring the King of his fidelity, he maintained secret relations with the Radical, and even with Bolshevist, elements. Impatient at the postponement of his ambitious hopes, he declared openly that he would keep no bounds, which agreed with his announcement in Parliament on Oct. 18 1918 that he intended henceforth to substitute deeds for words. At the same time he made skilful use of a means which gained him great popularity, viz., his supposed intimate relations with the Entente Powers, by means of which he promised to procure for the country the peace for which it earnestly longed. It was indeed this war-weariness which accounted for the amazing influence which Karolyi actually exercised, the secret of which was that he was believed to be the one man who could bring peace to Hungary. But Karolyi overestimated both his own abilities and his influence with the Entente. Because he had formerly always taken up in Parliament an attitude of hostility to the Triple Alliance, he believed that he had only to hold out his hand to the Entente Powers and these would at once grant Hungary favourable terms of peace. In view of the danger threatening from Karolyi and the Radicals, Tisza—the "granite head" as Prince Ludwig Windischgrätz called him—at last showed himself not indisposed to make concessions in the matter of franchise reform. He was even prepared to come to terms with his old antagonist Andrássy, to propose him for the office of Foreign Minister, and to support him. Into the midst of this confusion fell like a bombshell the young Emperor-King's manifesto of Oct. 16, which proclaimed the liquidation of the monarchy and its transformation into a Federal state. It was the most unfortunate of all Charles's actions. The immediate and logical result of the manifesto, which destroyed dualism, was that Hungary declared that she had recovered her rights as a separate state and that henceforth she would be bound to Austria solely by the personal union of the Crown.

Meanwhile the power of social democracy had grown ever greater and greater. Nothing had been done to satisfy its burning desire for universal and secret suffrage, and it was therefore in the highest degree discontented. Among wide classes of the population the failure to carry out the oft-repeated promise of an extension of the franchise, especially in the case of the soldiers, had shattered all confidence in the King and the Government. The ground was thus prepared for the most Radical party cries to take root and flourish. All authority was undermined, and its place was taken by a deep-rooted hatred of the governing classes who had hitherto directed the destinies of the country. At this crisis, which called for a strong guiding brain and hand, the throne was occupied by a sovereign who, though quite well-meaning, was too inexperienced and too weak to do the right thing. The representatives of the power of the State showed themselves no less weak; it was as though everyone had conspired to paralyse all the organs of the State and to destroy its order. As is always the case at the outbreak of revolutions, men who had hitherto avoided the light now rose to the surface from the lower depths. An atmosphere had been created in which it was possible for such Catilinarian figures as Count Michael Karolyi and his fellows to flourish. The revolutionary spirit had received rich nourishment from Béla Kun, who had returned from captivity in Russia, liberally provided with Bolshevist money, and employed himself in spreading the doctrines of Lenin and Trotsky in the barracks and among the troops at the front. In the same spirit, on Oct. 25 1918, and on Karolyi's suggestion, a National Council was organized.

*Karolyi in Power.*—It now became fatally clear that everyone was agreed that the King had no choice but to appoint Karolyi Minister-President in succession to Wekerle, who had resigned. Even Tisza advised this course. Thus the helm of the State was to be put into the hands of the man who based his policy on the world-revolution which was to enforce peace. It was not, however, as yet clear that a violent revolution would be successful. On the night of Oct. 29–30 Oskar Jaszi, the principal mob leader, told his comrade Kunfi that they would probably both be hanged on the morrow; for they feared that Field-Marshal Lukachich would lead his troops against them and make an end once for all of revolutionary nonsense. But when, towards the morning of the 30th, the general had not put in an appearance, they regained courage. In the half-light of dawn bands of soldiers, seduced by the revolutionary propaganda, began to concentrate in the region about the Hotel Astoria, carrying red and national flags, and shouting "Long live Karolyi! Long live the Revolution!" Soon the tidings spread abroad that Karolyi had been appointed Minister-President. When Jaszi stepped out on to the balcony of the Hotel Astoria and announced the King's decision to the assembled crowds, he was met with cries of "The King? Who is the King now? It is not the King who nominated Karolyi. He is Minister-President by the will of the Revolution. Long live the Republic!" It was a victory for the mob, and its immediate effect was to make the position of Andrássy, the newly appointed Foreign Minister in Vienna, impossible. Karolyi at once ordered the withdrawal of the Hungarian troops from the front, in conformity with Lenin's prescription making the dissolution of the army the essential condition precedent to the social revolution. This sealed the fate of Hungary, which was thus rendered absolutely defenceless.

The first victim of the new régime was Count Tisza, who was murdered on the morning of Oct. 31. His all too stubborn resistance to the extension of the franchise had earned him the hatred of the people. It was also universally believed at that time that it was to his advice that the beginning of the war was principally due, though it has since been proved, from official sources, that, on the contrary, Tisza was the only one of the ministers present at the fateful council who spoke against the declaration of war on Serbia, a fact which he was too proud to announce publicly during his lifetime.

Karolyi had triumphed over even his strongest opponents, but he was not destined to enjoy his triumph long. Now that he had seized the reins of government it was soon abundantly clear that he had none of the qualities enabling him to fill the part to which his morbid ambition had led him to aspire, and that, where he thought to push, he was himself pushed. When the reins of government slipped from his feeble hands, he played them into those of the Bolshevists, who, emancipated from all ties of country, indulged in an orgy of plunder and murder, plunging Hungary into a misery deeper than any she had suffered from the war. (E. v. W.)

*The People's Republic.*—The forces by which the monarchy and the constitution were overthrown, and which after their overthrow controlled the situation, were represented by three groups, of which only one had previously been represented in Parliament—that led by Karolyi. These groups were (1) the Social Democratic party, which in 1919 had 215,022 associate members; (2) the Bourgeois-Radical party of Oskar Jaszi (b. 1885), the members of which were mainly Jewish intellectuals; (3) the party of Independence, under Count Karolyi, which had great support among the undiluted Magyars of the Alföld (the great central Hungarian plain) because it upheld the Kossuth tradition of separation from Austria. It was the representatives of these three groups who, under Karolyi's leadership, had constituted the National Council on Oct. 26. On the 29th the Diet at Agram declared the independence of Croatia, and on the 30th the National Assembly of German-Austria proclaimed the Republic at Vienna. On the night of Oct. 30 occurred the revolution in Budapest. Workmen's and soldiers' councils on the Russian model had already been formed; but, though the revolution was the work of the mob, it undoubtedly had wide support among the middle classes and the peasants, while the murder of Count Tisza removed the only man strong enough to have arrested its course.

After Wekerle's retirement the Archduke Joseph, as the King's representative, had nominated a new Ministry consisting of members of the three revolutionary groups, with Karolyi at their head. These men at first took the oath of allegiance; but as early as Nov. 1 they asked permission to rescind it; the King's permission was given, and the Karolyi Cabinet constituted itself as a People's Government, and took a fresh oath of allegiance to the National Council. To the further wish expressed by the Government, that King Charles should abdicate, he made no reply; but on Nov. 13 he issued from Eckartsau a proclamation announcing his withdrawal from all affairs of State, and his recognition in advance of any form of government which the Hungarians might decide upon.

On Nov. 16 the National Council proclaimed Hungary a People's Republic, dissolved the two Houses of Parliament, and handed over power to Karolyi and a committee of the National Council, pending the convocation of a National Constituent Assembly, which, however, never met. On Jan. 11 Karolyi was elected by the National Council provisional President of the Republic and he himself appointed Dionys Berinkey (b. 1871) Minister-President. The new Government did not recognize the armistice concluded by the Italian Gen. Diaz with the Higher Command of the dissolving Austro-Hungarian army; and, in the hope that as a pacifist and a consistent opponent of war he would obtain better terms for Hungary, Karolyi proceeded to Belgrade, where he concluded with Gen. Franchet d'Espérey, the commander-in-chief of the Entente troops in the Balkans, a fresh armistice. He had already deliberately destroyed the Hungarian army; the new armistice established a line of demarcation which gave over large portions of Hungary and Transylvania to Rumanian and Serbian occupation.

In order to avoid the threatened partition Karolyi and Oskar Jaszi, the Minister of Nationalities, began negotiations for the transformation of Hungary into a pacifist confederation. They had not proceeded far, however, before the country was invaded by Rumanian and Czech troops, who occupied two-thirds of it, even beyond the lines of demarcation. A few of the Hungarian troops which had arrived in good order from the front wished to offer resistance; but this Karolyi would not allow. The military mission of the Entente in Budapest took cognizance of this further occupation, but paid no attention to the protests of the Hungarians.

The failure of the Government in its dealings with the Entente roused bitter feeling among the people, who had hoped that the new men would be able to save the thousand-year-old Magyar State, and this discontent was rendered more acute by the anti-national attitude of the two Government parties, the Social Democrats and the Bourgeois-Radicals. In consequence of the disbandment of the army, there was only one organized force in the country, that of the Socialist trade unions, the leaders of which now desired to assert their new-won power. They thwarted all attempts to form a new National army, and the fall of two War Ministers was caused by parades of Socialist soldiers' councils. As the Social Democrats and the Jaszi Radicals were also agitating against the influence of the Church, so dominant in Hungary, and in favour of non-religious ethics, the reaction developed on nationalist and religious principles. The Szekler soldiers, who had been driven from Transylvania by the Rumanians, the league of "awakening Hungarians," and the officers' associations greatly stimulated the resentment felt against the pacifist and Radical-Socialist Administration. This resentment assumed an anti-Semitic character hitherto unknown in Hungary, the reason being that the leaders of the Social Democrats and Bourgeois-Radicals were, almost without exception, of Jewish origin. This was also the case with the most prominent members of the Government of the Republic—Oskar Jaszi; Siegmund Kunfi, the Minister of Education (b. 1889); William Bochm, the Minister of War; and Joseph Pogany (b. 1886), the president of the Soldiers' Council. These were the men who had made it impossible to resist the invasion of Hungary by force of arms.

The Government attempted to win over the peasants by a radical scheme of land reform, a People's Law (18 of the year 1919) decreeing the breaking-up and distribution of all estates of 500 *Joch* (about 900 acres) and over; but this law was never carried out. The anti-national programme of the Social Democrats, who were alone effectively organized, caused divisions in both the other Government groups.

*The Communists under Béla Kun.*—The Social Democratic party, which alone was organized, by its anti-nationalist demands caused divisions in both the other Government parties. A portion of the Karolyi Independence party went over to the Opposition, and the Jaszi Radicals abandoned, as useless, all attempt at participation in the approaching elections to the National Assembly, which was to be summoned in order to decide all questions definitely. In the vehement election campaign the Social Democrats fought, on one side against the Nationalist bourgeois or peasants, and, on the other side, against the new Communist party. This latter was founded on Nov. 24 1918 by some returned prisoners-of-war from Russia, among whom the most conspicuous was Béla Kun, who had been trained at Moscow in the schools for Bolshevist propaganda and had returned to Hungary to prepare the Communist revolution. Between Jan. and March 1919 the Communists succeeded in stirring up several riots and insurrections among disabled and discharged soldiers and among the unemployed. Their efforts were directed against the Social Democrats, and especially against the minister Kunfi and the trade-union leader Jacob Weltner; and when on Feb. 20 Béla Kun with his Communists stormed the Social Democratic publication office, he was

arrested and roughly treated by the police. Since, however, a counter-revolution on national lines was gaining strength in the country, and, on the other hand, the workmen's and soldiers' councils were becoming daily more radical under the influence of the Communist agitation, the leaders of the Social Democrats decided to seek escape from this situation by a fusion of the two Labour parties and the proclamation of the "dictatorship of the proletariat" on the Bolshevist model. In accordance with the compact signed (March 4 1919) by the Socialist minister Kunfi and the Communist leader Béla Kun in the latter's prison, both groups united to form the Hungarian Socialist party, abandoned democratic principles, and took over the government of the country in alliance with Soviet Russia. The People's Government resigned, and President Karolyi surrendered his powers to the new Hungarian Soviet Government.

*Period of Soviet Government.*—According to the Constitutional Law (Soviet Ordinance No. XXVI.), which was borrowed from Russian Bolshevism, the object of Soviet dominion in Hungary was "the destruction of capitalistic production and society and the creation of social (communistic) production and society by securing the dominion of the workers over the exploiters by means of the dictatorship of the proletariat." The dictatorship, according to this regulation, was to be exercised through the workmen's, soldiers' and peasants' councils (soviets). Only "workers" were allowed to vote for the local soviets; traders, the clergy, monks and nuns, and all who lived on rents or the interest on investments were disfranchised. Deputies from the local soviets constituted the central soviet, which was to choose the People's Commissaries, in whom all actual power was vested. The 16 People's Commissaries to whom Karolyi had transferred his powers on March 21 were subsequently confirmed in their authority by the central soviet. A stonemason named Alexander Garbai (b. 1879) became President of the Republic, but the actual ruler was Béla Kun, "People's Commissary" for foreign affairs, who was in direct contact with Lenin in Russia. As candidates for the local soviets had to be chosen from the official list, power was permanently secured to the People's Commissaries. The old administrative system was in principle abolished. At the head of the more important offices were placed "political commissaries," appointed by the People's Commissaries and armed with dictatorial power. The officers of the law were removed from their posts and the courts done away with; the new "revolutionary tribunals" were composed entirely of workmen. Workmen also supervised education.

In making the compact with Béla Kun the Social Democrats had, indeed, abandoned democratic principles, but they failed to understand the methods of the new dictatorship and to the last their attitude towards it was purely passive. The only active agents of the dictatorship were the true Communists who in the whole country numbered only some 15,000, mostly unemployed, and Budapest soldiers won over by Béla Kun with money and promises. In order to maintain its power this minority had to imitate the methods of Bolshevist Russia by a system of terror and propaganda in the towns and countryside in the interests of the dictatorship. Terror was proclaimed as an instrument of government in the official declarations and proclamations of the Communists. It took the form of the enlistment of a Communist army, of the quartering of Communists on middle-class families, of the arrest of "hostages" (in Budapest only)—some 400-odd distinguished citizens, politicians and writers, of whom some were bestially murdered—and, finally, of the organization of special "terror troops" whose function was to terrorize the people. The "terror troop" known as "Lenin's ruffians," which acted as guard to the strongly fortified house in which the People's Commissaries lived and worked, arrested, tortured and executed people on their own authority. For the provinces a special terror troop was created, under the leadership of the People's Commissary Tibor Szamuelly, which was empowered to inflict the death penalty without any formalities whatever.

In the interests of the propaganda an attempt was made to suppress all expressions of national and religious life, and to spread the Communist conception of the world which had been imported from Russia by means of posters, pamphlets, brochures, processions, meetings and education. With the exception of three official Communist journals, all newspapers were suppressed, and the writers were placed in a Government office where they could only work under State supervision and censorship. The right of public meeting was abolished, except for Communistic objects. A propaganda abroad was instituted in order to spread Bolshevism in the countries bordering on Hungary; schools of propaganda for the training of agitators were established, and an "international red army" consisting of Russian and Italian prisoners-of-war was created. The principal object of all this was the erection of Soviet Government in Austria. For this purpose the Communist party in Vienna was provided with money; and when a demonstration organized by this party with a view to the proclamation of the Soviet régime resulted in nothing but futile bloodshed, Béla Kun deposed the leader of the party and replaced him by a Hungarian Communist. On this particular work of propaganda the diplomatic mission of Soviet Hungary in Vienna spent 60,000,000 kronen.

The schools served the Soviet Government chiefly by way of propaganda; and with this in view all religion and authority were excluded. In the middle schools the pupils themselves elected Pupils' Councils whose function was to control the activities of the teachers. All mention of the nation or of religion in the lessons was forbidden, and, instead of the national heroes, Marx, Engels and Lenin were glorified, together with Spartacus and Catiline, their forerunners in the task of liberating the working-classes. It was sought to spread the doctrines of historical materialism; the university was reorganized and deprived of its autonomy, and, as the highest educational establishment, an "Institute for Research into Historical Materialism" was founded. In boys' and girls' schools the pupils received enlightening instruction in the processes of generation, birth, etc., with disastrous results to juvenile morality.

A complete revolution was brought about in the economic organization of the country. Certain occupations were entirely prohibited, such as judges and lawyers generally, bank officials, trade employees, workers in gold, confectioners, cooks, hotel employees, paper-hangers, sign-writers, hatters, bookbinders and barbers. All private property was declared to be the property of the State; business houses were closed and their wares sold by official agents for the benefit of the State. The most valuable furniture, carpets, pianos, pictures and libraries were collected from private houses and taken to Government stores. Trade became a State monopoly. Manufactories were taken over by councils of workmen connected with the particular industry; manufacturers, engineers and officials were placed under the orders of these councils, or driven away. The distribution of raw materials to the factories was managed by a Government office. Industries declined through want of capital, and the diminution of output owing to payment by time was so great that presently the workmen themselves were anxious to return to the piece-work system. Cost prices advanced by leaps and bounds. In March 1919 the cost price of cast iron was 50·80 kr. per 100 kgm.; in April 2,700 kronen. The output of the Salgo-Tarján mines fell by more than 50% under the Soviets. The small manufacturers and homeworkers, who were regarded as exploiters, were refused raw material and their businesses were closed. In the agricultural districts, all landed property was taken over by the State, the large estates were placed under the management of workmen, but the Government allowed the peasants to retain holdings up to 100 *Joch* (about 180 acres) as private property.

*Counter-Revolutionary Movements.*—A few weeks only had passed under this régime before the Soviet Government had to fight for its life both at home and in its relations with foreign Powers. Nobody but the small Communist minority was satisfied with its decrees. It found opponents alike in the trades unions, which the Communists wished to destroy because of their democratic past; the terrorized middle classes, traders and industrialists, who were without bread to eat; and the clergy,

who were persecuted by the Soviets which attacked Christianity and the Church after the Russian model and were only prevented from closing all places of worship by the wrath of the people. In the schools and among the country folk the commissaries preached atheism, free love and the advantages of communal kitchens. In consequence of the industrial crisis, the Soviets were unable to supply the peasants with any implements, while the Soviet currency, which in violation of the charter of the State Bank was turned out by the printing press in immense quantities, was now worthless. The peasants therefore refused to supply any produce, and the towns, and especially Budapest, suffered from want of food. Isolated uprisings of the peasantry were bloodily suppressed by Szamuelly's "terror troops." Since most of the ruling politicians and People's Commissaries (Béla Kun, Szamuelly, Commandants Pogany and Böhm, and Finance Commissary Eugene Varga) belonged to the younger generation of Jews, anti-Communist feeling in the country assumed more and more the character of anti-Semitism. In May 1919, the politicians, officers and officials who had fled from the terror to the districts in Rumanian occupation formed a counter-revolutionary Government under Count Julius Karolyi (b. May 7 1871), which, establishing itself at Szeged, proceeded, under the direction of the former Vice-Adml. Nicholas Horthy, to recruit and organize a "National army" against the Communists.

*Downfall of the Soviet Government.*—The Soviet Government viewed Hungary as Lenin's outpost, which was to be held until Communism had been victorious in the neighbouring countries also. Béla Kun, therefore, attempted to open negotiations for peace with the Allies and was prepared to abandon Hungary's territorial claims if thereby he could secure the continuance of Soviet rule and gain greater opportunities for propaganda. On the other hand, the Soviet Government created a "Red army" "for the liberation of the Proletariat." As Béla Kun failed to come to an agreement with Gen. Smuts, the delegate of the Supreme Council in Paris, Rumanian troops on April 10 1919 took the offensive against Soviet Hungary, defeated the Red army and occupied the line of the Theiss. After this disaster, the Soviet Government reorganized the Red army. The system of soldiers' councils and civil commissaries with the army was abolished; and the authority of professional officers and discipline were restored; the use of national emblems was permitted and appeals to patriotism were used in order to excite the soldiers against the invading enemy. The Serbs and Rumanians having refused a fresh offer made to them by Béla Kun, the latter determined to anticipate their now inevitable offensive by ordering an attack on the Czechs. The soldiers, fired by patriotic enthusiasm, defeated the Czechs and occupied the greater part of northern Hungary. But when, on the categorical demand of Clemenceau (June 8), Béla Kun gave back the reconquered territories to the Czechs, in the hope thereby of saving the Soviet Government, the *moral* of the troops was completely broken. The growth of national anti-revolutionary feeling and the boycotting of the capital by the peasantry, which led to starvation among the workmen, drove the Soviet Government to make a last desperate attack on the Rumanians in order to secure the harvest of the Theiss district.

But the Red troops scattered at the first attack; the Rumanians crossed the Theiss, and advanced on Budapest without meeting any resistance. The Soviet Government resigned on Aug. 1. Its Communist members, including Béla Kun, went to Vienna, where they were allowed the right of asylum by the Austrian Government. Later, some of them left for Russia. Szamuelly, the leader of the "terror troops," shot himself during his flight.

*Hungary after Bolshevism, 1919.*—In view of the Communist breakdown, the Socialist organizations now reasserted the principles of democracy, severed their connexion with the Communists, and, under the presidency of Julius Peidl, formed a purely Social-Democratic Ministry. But the influence of the Social Democrats had been so weakened by their coöperation with the Bolshevists that the new Ministry could only survive for five days. On Aug. 6 a group of citizens and officers demanded its resignation, and it obeyed.

The representatives of the Entente in Budapest put the government of the country into the hands of the popular Archduke Joseph, who formed a Ministry of members of the counter-revolutionary middle class, under the premiership of Stephen Friedrich (b. July 1 1883).

*The Rumanian Occupation.*—After the disbandment of the Red army Rumanian troops occupied Budapest and the whole of what remained of Hungary, with the exception of the western border counties, in spite of the prohibition of the Entente representative in Budapest. As a result, political activity in the country was crippled, and the reëstablishment of order after the Bolshevik experiment retarded. The Rumanians were several times ordered to evacuate the country by Clemenceau, in the name of the Supreme Council, but they declared that they wished first to take revenge on Hungary for the plundering of Rumania by the German troops during the war. They took grain, fodder, cattle, 1,151 locomotives, 40,950 railway carriages, all the post-office motor-cars from Budapest, 4,000 telephone installations from the Budapest central exchange, the telephones and typewriting machines from the Government offices and schools, beds and bed linen from hotels and prisons, and scientific apparatus from the schools. Machinery was removed from factories; the iron beams of the Cyör cannon works were torn from the walls and carried off—the journey to Rumania in open trucks entirely destroyed them. It was only as the result of an ultimatum from the Supreme Council that the Rumanians at last withdrew from Budapest (Nov. 11) and from the line of the Theiss (Feb. 1920).

*New Governments, 1920.*—After the fall of Bolshevist rule and the Rumanian occupation, Hungary was only able slowly to regain order in her internal affairs. The neighbouring countries hostile to the Habsburgs (Czechs, Yugoslavs, Rumanians) would not tolerate the regency of the Archduke Joseph. By an order of the Entente, accordingly, the Archduke, together with the prime minister whom he had appointed, resigned office, and the political parties appointed the Christian Socialist Karl Huzzár (b. Sept. 10 1882) president, pending the meeting of the National Assembly. Order was maintained during the Rumanian occupation by a civil police force, and, after the Rumanian withdrawal, by the national army under Horthy. The effects of the Bolshevist dictatorship had now produced a strong reaction. During the dictatorship, the extermination of the *bourgeoisie* and the shooting of whole villages of peasants had been spoken of at meetings and in the official press as normal Government measures, the result being that both citizens and peasants only slowly became again accustomed to a system based on orderly justice. During the masterless days after the fall of Bolshevism, there were in the country districts many cases of lynch law exercised upon the Communists. The successive Governments of Huzzár, Simonyi-Semadam (b. March 28 1864), Count Paul Teleki (b. Nov. 11 1879, formerly professor of geography), which held office from June 19 1920 to April 15 1921, took great pains to restore the authority of the law, and in order to restrain unlawful acts of vengeance they several times proclaimed martial law, and broke up by force of arms certain civil and military organizations.

The relations of the political parties were quite changed as a result of Bolshevism. In the place of former parties, differentiated by their ideas of the State, new ones sprang up which, in opposition to the anti-national and anti-religious tendencies of Bolshevism, formulated a National-Christian programme intended to make impossible any repetition of the Communist times. At the elections in Jan. 1920, which for the first time in Hungary were conducted on the basis of universal and secret suffrage, with the exception of six Democrats, only members of the *Bourgeois* Christian Nationalist and Peasant Farmers' parties were elected to the National Assembly. Socialist ideas had forfeited all sympathy among the rural population and the citizens of the towns on account of their association with Bolshevism. The trades unions found their political activities

obstructed; whereupon, on June 20 1920, the International Federation of Trades Unions at Amsterdam declared a boycott of Hungary. Hungary replied with a boycott of Austria, where the Labour men of the Socialist Left were vigorously applying to Hungary the boycott ordered by the international conference, and cut off Austria's food and coal supplies. The result was that the original boycott was withdrawn, although no advantages had been secured by the Hungarian Socialists. One consequence of the Bolshevist rule was the still more intense development of anti-Semitic feeling. Since leaders of the Communists were chiefly recruited among the younger Jewish intellectual circles, the National Assembly, in order to prevent the creation of a Jewish intellectual proletariat, in Sept. 1920 proclaimed the "Numerus Clausus" for the universities. Under this clause, Jews could only be admitted to the universities in proportion to their percentage of the population. By the desire of the Small Farmers' party, a bill was passed, on the lines of the English Small Holdings Act, making it possible for every agricultural labourer to acquire a holding up to 10 *Joch*.

As a consequence of the annexation of parts of the old Hungary by the new states, what remained of the country was filled with fugitives, mostly officials, teachers, etc., who had been driven out by Czechs, Rumanians and southern Slavs. All economic and cultural intercourse between the rump of Hungary and the territories now occupied by the new states continued to be interrupted even after the collapse of Bolshevism.

Huzzár's Government was, on Dec. 2 1919, invited to the Peace Conference in Paris by the Entente. The Hungarian delegation, headed by Count Albert Apponyi, was forced to sign the Treaty of Trianon (June 4 1920) without being given any opportunity of discussing the conditions imposed by the Entente, under which more than two-thirds of the old Hungary was divided among the neighbouring states.

*Admi. Horthy as "Regent."*—After experience of the Karolyi and the Soviet republics, the traditional monarchist feeling became evident in Hungary; but as the neighbouring states, members of the "Little Entente," Czechoslovakia, Yugoslavia and Rumania, and also Italy, saw in the occupation of the throne of Hungary by a member of the House of Habsburg a danger to themselves, and threatened to treat such an event as a *casus belli*, the National Assembly postponed all decision as to the form of the State, leaving the question of the sovereign undecided, and on March 1 1920 entrusted the commander-in-chief, Adml. Horthy, with supreme power as regent.

The recovery of the State from the effects of Bolshevist rule proceeded slowly. At Easter 1920 the Finance Minister of the Teleki Government, Roland Hegedüs (b June 24 1872), established the machinery for the paper currency. The national revenue had been made in March 1921 to balance expenditure; and the Foreign Minister, Gustav Gratz (b. 1875), began to negotiate for resumption of economic relations with the new States built out of the ruins of the Habsburg Monarchy.

When at Easter 1921 King Charles, without awaiting the decision of the National Assembly as to the exercise of the royal power, suddenly appeared in Hungary and wished to take over the powers of the regent, the latter refused to hand them over, since to have done so would have been contrary to the law under which he held the regency. The King was forced, therefore, again to leave the country, amid the loud protests of the "Little Entente" against his enterprise. His subsequent attempt, in Oct. 1921, at a *coup d'état* was even more disastrous to him; and he was then interned at Madeira under Allied surveillance. The Teleki Government was replaced on April 15 1921 by the Christian-National-Agrarian Ministry of Count Stephen Bethlen.

*See* Memoirs of Count J. Andrássy (*Diplomacy and World War*, Hung. and Germ., 1920); Prince Ludwig Windischgrätz, *Vom roten zum schwarzen Prinzen* (1920); Oskar Jászi, *Magyar Kálvária, Magyar Feltámadás* (1920); *The Ordinances of the Soviet Republic* (Hung., 5 vols., 1919). On the Soviet period there are several journalistic works, as well as the publications of certain People's Commissaries, issued after the fall of the Soviet régime, as apologies and for purposes of further propaganda, of which may be mentioned Eugen Varga, *Die wirtschaftspolitischen Probleme der proletarischen Diktatur* (1920); Béla Szántó, *A Magyarországi proletariatus osztályharcza és diktaturája* (1920); and *Dokumente der Einheit, die Vorgeschichte des Zusammenschlusses der Social-Demokraten und Kommunisten* (1919); Alexander Szana, *Die bolschevistische Wirtschaftspolitik in Ungarn*.

Reports by workmen on the economic conditions will be found in the Social-Democratic weekly, *Világosság* (Vienna, 1920). A comprehensive account based on documentary evidence is given in *A bolsevizmus Magyarországon* (*Bolshevism in Hungary*) edited by Gustav Gratz (1921). (J. S.*)

## Hungarian Literature

In 1908 a parting of the ways between the younger and the older generations in Hungarian letters was definitely marked when some of the younger poets published the new songs of the new time in two volumes under the title *The Coming Day*, and founded the periodical *West* which, enlarging itself by the adoption of a political programme, was made their organ of progress. The most complete expression of the new revolutionary spirit found itself in lyrical poetry, which attained its full maturity in the poems of Andreas Ady (1877–1919).

Ady's lyrics display a Hungarian language rooted in the remote past and awaken the old tones of the peasant-crusader (*curuczok*) poetry of the 16th century and of the Protestant Bible, but transfused with a new idiom personal to himself. His language is submerged in the twilight depths of the soul, battles against the narrowness of middle-class morality, and revels in sensual love. His outlook on life attracted him towards the Socialist and Pacifist schools of thought, and he thus became the representative of those Social-Democratic phrase-mongers who, in the autumn of 1918, led Hungary along the path of destruction. His poems were published in 9 vols.:—*New Poems, Blood and Gold, By the Chariot of Elijah, Ye Must Love Me, Elusive Life, Self-love, Who Saw Me, From the Poems of Primeval Secrets, At the Head of the Dead.* Ady's novels display a naturalism subjectively experienced, as in *Thus May It Also Happen, Pale People, The Cleopatra with Ten Millions, On a New Path.* He also published polemical works in favour of his political views. An appreciation of him was written by John Horváth in *Ady and the Newest Hungarian Lyrical Poetry.*

Beside Ady the most important of the writers connected with the periodical *West* was Michael Babits, whose poems express with great perfection of form and moving effect the self-destructive suffering of civilized man in the 20th century. He wrote *Leaves from the Wreath of Iris*, and *The Valley of Unrest.* Desider Kosztolanyi (b. 1885) interpreted the romance and melancholy of Budapest in *The Laments of the Poor Child*, and *Poppy.* Among others may be mentioned Arpad Toth (b. 1886), Gabriel Olah, Ernö Szep, Julius Juhasz, Béla Halasz, and Renée Erdös—the last-named a lady whose muse, pagan and erotic at first, was converted later into Catholic and penitent. At the beginning of the World War an enthusiastic welcome was given to the patriotic poems of Geiza Gyoni (d. 1917), which were written at the front and sent home from Siberia. These poems, modern in style, were published under the titles *On Polish Fields*, and *Letters from the Hill of Calvary.* To the radical school of thought belonged also Joseph Kiss (b. 1843), who, following the tradition of Arany, wrote pacifist war-songs and several beautiful ballads, his lyrics having an oriental charm. The new poetry had many champions among critics and essayists, notably Aladár Schöpflin and Ludwig von Harvany.

In prose fiction and the drama modernism was less strongly marked, though the new philosophy of life differed from that of the earlier generation. The most important novelist of this period was Siegmund Móricz (b. 1879), who wrote *Gold in the Muck, Behind the Devil, The Torch.* Margaret Kaffka (1880–1918) gives in her novels, *e.g. Maria's Apprenticeship* and *Colours and Years*, sketches of contemporary politics. Francis Molnár (b. 1878) describes in his novel *Andor* the wasted life of a decadent young man. Mention may also be made of Michael Suranyi's novels, *The Peacock from Trianon* and *The Holy Mountain.*

On the Hungarian stage modern ideas and traditional convention were in sharp competition. To the latter belong *The Nurse* and *The School-mistress* of Alexander Bródy (b. 1863), together with his war drama, *Lyon Lea*, centring round the life of the Galician Jews. Desider Szomory wrote tragedies on themes taken from the history of the House of Habsburg, *Maria Theresa* and *Joseph II.*, and in *Bella, Hermelin* and *Matuska* he dramatized the sexual life of the modern woman. Francis Molnár, the novelist already mentioned, became a popular and successful writer of drawing-room drama, with a great mastery of stage routine and technique. His best-known plays are *The Guards Officer, The Devil, The Wolf, The Carnival, The Swan* and *Liliom*, a picture of apache life. Among his successful rivals in the same genre are Melchior Lengyel, with his *The Prophet* and *Typhoon*, and Louis Brió, author of *The Tsaritsa.* Among the younger of the dramatists is G. Drégely, author of *The Well-fitting Dress Suit.*

As representatives of the older generation of conservative poets may be mentioned Joseph Levay (1825–1918), Alexander Endrödy (1850–1920), Andrew Kozma (b. 1861), author of *Hungarian Sym-*

*phonies.* Koloman Mikszáth, the greatest Hungarian novelist after Jókai, died in 1910; his *The Black City* did not appear until 1911, and his *Posthumous Works* were issued subsequently. Among the effective romance writers of the old school was Francis Herczeg (b. 1863), who wrote numerous novels, and also appeared as a playwright in *Blue Fox* and *The Black Horseman.* Noteworthy also was Geiza Gardonyi (b. 1863), who draws his homely themes from the life of the villages and small towns, but who also seeks inspiration in Hungarian heroic legend and in the faith of mediaeval cloisters. Gardonyi is one of the most sympathetic of contemporary Hungarian writers; as in his tales *The Longhaired Peril* and *'Tis Far Till Then* (1913); Stephen Tömörkény wrote genre word-pictures, such as *People in the Service of the Country* (1916); as also did the novelist Cäcilie Tormay (b. 1876), *e.g. The Old House.* In light literature Julius Pekar did some good work, and also as a political writer in support of national ideals. Noteworthy also are the popular writers Koloman Catho and Alfred von Drasche-Lazar.

The conservative literary school was supported by a host of competent critics. Eugen Rakosi (b. 1842) opposed the modern literature of decadence with all the force of his burning enthusiasm, as in his *For the Hungarian Idea.* Zoltán Ambrus (b. 1861) was an esteemed dramatic critic. G. Vojnovich (b. 1877), E. Császár (b. 1878) and L. Kéky were also critics of conservative tendencies.

After the revolution of Oct. 30 1918, the political current brought to the surface a mass of pacifist, defeatist and cosmopolitan literature. Under the presidency of Ady and Siegmund Móricz, the progressives founded their own Academy which they named after the national romantic poet, Vörösmarty. With the end of the World War signs of futurism and expressionism had already appeared. The new writers of the social world-revolution rejected all poetical form. Their ideals were cosmic universalism and the collective solidarity of international mankind. But only one of them possessed any real merit—the iron-worker Louis Kaszak, who had developed from naturalism into the poet of the proletariat in his *Book of new Poets.* The periodical *To-day* became the semi-official organ of Communist literature. It must be added that Communism in Hungary, as in Russia, suppressed the free publication of books and appointed the People's Commissariat as sole publisher with the unrestricted right of censorship. The book market was now flooded with works of Communist propaganda. The theatres, turned into State institutions, were forced to perform plays with a Communist moral. No composition of any permanent value was produced by the Commune. After its fall Desider Szabo took the lead of the new literary movement. In his poems he laments in vigorous language the Szeklers of Transylvania, now separated from their mother country, as in his *The Village Torn Away* (1919). In addition to Szabo, a poet writing under the pseudonym of " Vegvari " protested in the poem *Help!* against the dismemberment of Hungary.

Journalism, finally, has developed greatly in Hungary since the 'seventies and, since it employs a number of literary men, deserves mention here. Numerous periodicals are in the habit of publishing feuilletons, short stories and serial novels.

*History.*—The centre of Hungarian historical research, as of the other sciences, is the Hungarian Academy of Science, of which Albert von Berzeviczy (b. 1853) was president in 1921. Robbed of its revenues under the Bolshevik régime, vigorous efforts were made to reëstablish it after the restoration of order.

In historical writing and research great activity has been displayed in Hungary since 1910. Vol. xii. of Arpad Karolyi's *Acts of the Hungarian Parliament* contains fresh material of great importance for the study of the religious wars of the 16th century in Hungary. Desider Czánki published a further instalment of his *Historical Geography of Hungary during the period of the Hunyadi;* Lukinich his *Transylvania's territorial transformations;* and Julius Nagy *Codex diplomaticus Andageviensis;* Samuel Gergely, *Codex Comitum Teleki;* Francis Döry, *Codex Comitum Zichy.* Other works of original research are:—William Fraknoi (b. 1843), *Critical Studies relating to the History of the Triple Alliance,* and *The place of Hungary in the World War;* Árpád Karolyi, *The Döbling literary remains of Count Stephen Széchenyi;* Eduard von Wertheimer (b. 1848), *Count Julius Andrássy, his life and times* and *Friedenskongresse und Friedensschlüsse;* Viktor Concha (b. 1846), *The Friendship of Baron Eötvös and Montalambert;* Heinrich Marczali (b. 1856), *Ungarische Verfassungsgeschichte;* Julius Szekfü (b. 1883), *The Hungarian State,* and *Three Generations, the History of a declining Age;* Balint Homan, *The financial History of Hungary from 1000–1325;* Ladislaus von Szabó, *History of the country family of Széchenyi;* Baron Gabriel Szalay, *Letters of Ladislaus von Szalay;* Stephen Cserey, *The Law of Succession to the Hungarian throne;* Alexander Domanowszky (b. 1877), *The Succession to the throne in the time of the Arpads.*

*Philosophy.*—In the domain of philosophy Karl Böhm (d. 1911) was very productive. After his death appeared (1912) the 4th volume of his principal work *Man and his World,* in which he sought further to develop the subjective idealism of Fichte. Bernhard Alexander (b. 1850) published *Essays in the field of Modern Philosophy;* Julius Kornis (b. 1885), *Causality and the reign of law in Philosophy;* Eugen Posch, *The Phenomena of our Soul and their Nature;* Cecil Bognár, *Causality and the reign of Law in Physics;* Akusius Pauler (b. 1876) published *An Introduction to Philosophy,* which reached a 2nd edition as early as 1921.

*Jurisprudence.*—Among writers on scientific jurisprudence the following deserve special mention: Alexander Plosz (b. 1846), *Law of civil procedure;* Alexander Raffay, *Hungarian Private Law;* Joseph Illes (b. 1871), *Introduction to the history of Hungarian Law;* Gustav Szászy-Schwarz, *New Directions in Private Law;* Ernst Wittmann, *Methods of peaceful settlement of international disputes* and *Past and present of the right of the self-determination of nationalities;* Géza Magyary (b. 1864), *Civil procedure* and *Procedure in International Arbitration;* Paul Angyal (b. 1873), *Hungarian criminal procedure;* Julius Dertö, *The principle of objective damages for injury;* John Karacsonyi (b. 1858), *The territorial historical law of the Hungarian Nation;* Stephen Ereky, *Studies in historical Jurisprudence and in administration;* Felix Somló (d. 1920), *The foundations of Jurisprudence,* one of the most important works, which defines in a new way the ideas of law and of the State; Francis Finkey (b. 1870), *Manual of Hungarian criminal law procedure;* Wolfgang Heller, *Principles of Political Economy* (1920).

(B. Z.)

**HUNTER, SIR ROBERT** (1844–1913), English lawyer and philanthropist, was born Oct. 27 1844. Educated at the university of London, he qualified as a solicitor in 1867, and in 1882 became solicitor to the General Post Office. He devoted much of his time and energy to safeguarding the rights of the public in regard to open spaces and the preservation of rights of way, and was one of the principal promoters of the Commons Preservation Society founded in 1865. In 1868 he became its hon. solicitor, and successfully conducted suits for preserving Wimbledon and Wandsworth Commons and recovering a portion, wrongfully enclosed, of Epping Forest. Ashdown Forest, Hampstead Heath, Hindhead and the New Forest were also safeguarded by him. He was made K.C.B. in 1911, and died at Haslemere Nov. 6 1913, after a strenuous life of public service.

**HUSEIN IBN 'ALI** (1856– · ), Emir or Sherif of Mecca and first King of the Hejaz, came of the 'Abadila clan of the Ashraf (*see* 2.262) and was grandson of the first 'Abadila Emir, who died in 1858. He was born at Constantinople, but at the age of eight was taken to Mecca, where he followed a course of Moslem studies. He began his official career by assisting successive Sherifs, 'Abdulla and Husein (his uncles), in administration; but on the death of the latter in 1884 he acted in opposition to the succeeding Sherif 'Aun er Rafiq—a favourite of 'Abdul Hamid and Emir from 1882 to 1905—and was eventually (1895) sent to Constantinople. He became a member of the Imperial Ottoman Council. On the death of Sherif 'Ali, successor of 'Aun, Husein's uncle, 'Abdulla, was nominated to the Sherifate by the Porte, but he died on his way to Mecca and Husein was appointed in 1908 in his place. He at first showed a semblance of zeal on behalf of the suzerain Turks, but in reality desired the emancipation of the emirate of Mecca. He openly pursued an anti-Turkish policy from about 1913, and by 1916, seconded by able sons, had become the *de facto* power in the Hejaz, with wide influence outside. In June 1916, after the success of the Arab revolt against the Turks under his leadership, he assumed the title of " Sultan of Arabia," but later in the year, with the approval of the Allies, he was proclaimed " King of the Hejaz," a title indicating more accurately the extent of his territorial rule. In Aug. 1916 he issued a proclamation to the Moslem world justifying his claim to independence. King Husein showed considerable zeal for administrative reform in the Hejaz, notably in the public works, health, postal and telegraphic, and customs departments. He was present at a banquet which he gave to the representatives of the foreign Powers at Jidda, Feb. 1919, to celebrate the victorious conclusion of the war, and in other ways showed himself not averse to intercourse with non-Moslem Europeans. His four sons were the Emirs 'Ali, 'Abdulla, Faisal and Zeid (*see* ARABIA).

**HUTCHINSON, SIR JONATHAN** (1828–1913), English surgeon (*see* 14.13), died at Haslemere June 23 1913.

**HUTIER, OSKAR VON** (1857– ), Prussian general, was born Aug. 27 1857 at Erfurt. In command of the 1st Div. of the Prussian Guards he played a prominent part in the battles which attended the German advance in Aug. 1914. In 1915 he was placed in command of the XXI. Army Corps, and in Jan. 1917 of the Army Group (*Armeeabteilung*) D. On April 27 he took over the command of the VIII. Army with part of which he occupied Riga. In Dec. 1917 he was transferred to the

command of the XVIII. Army on the western front, and in the following March bore a highly important part in the attack on the British positions between Cambrai and St. Quentin, in which his army formed the left flank of the German advance.

**HUTTON, ARTHUR WOLLASTON** (1848–1912), English divine and author, was born at Spridlington, Lincs., Sept. 5 1848. A scholar of Exeter College, Oxford, he took orders in the Church of England in 1872, but under Newman's influence became a Roman Catholic, and from 1876–83 was a member of the Edgbaston Oratorian community. He changed his views, however, renounced Roman Catholicism, and became known as an agnostic and free-thinker. For some years he was librarian at the National Liberal Club in London, but in 1898 he was readmitted to the English Church, and from 1903 to his death he was rector of Bow Church, London. His absolute sincerity and great intellectual ability were recognized by all. He was the author of a *Life of Manning* (1892). He died at Blackheath March 25 1912.

**HYDE, DOUGLAS** (1860– ), Irish scholar and writer, known in Ireland as the *Craoibhin Aoibhinn* (*i.e.* "delightful little branch," an allegorical name for Ireland, in folk-song), was born in 1860, the youngest son of the Rev. Arthur Hyde, of Frenchpark, co. Roscommon, and nearest living representative of the Castle Hyde family of co. Cork. He was educated at Trinity College, Dublin, where he won the highest honours, and afterwards spent a year in Canada in the State University of New Brunswick. Coming back to Ireland he helped to found in 1893 the Gaelic League or *Connradh na Gaedhilge*, and became its first president, a position to which he was annually reëlected until 1915, when he resigned. He was also first president of the National Literary Society, a post which he resigned on the foundation of the Gaelic League. As president of the elder society he had already in 1892 foreshadowed the ideals of the League in a lecture entitled "The necessity for de-anglicizing the Irish nation," not, he explained "as a protest against imitating what is best in the English people, for that would be absurd, but rather to show the folly of neglecting what is Irish, and hastening to adopt, pell-mell and indiscriminately, everything that is English, simply because it *is* English." For some years Dr. Hyde's work for "Irish Ireland" made little progress; but in 1899 an attack upon the Irish language, before a Vice-regal Committee to inquire into intermediate education, gave him his chance. He produced letters which he had procured from all the leading Celtic scholars in Europe as to the value of the language and literature, and the publication of these letters and his own evidence saved the language on the Intermediate Board, and attracted a great deal of attention throughout Ireland. Towards the beginning of the century the first *Oireachtas* was held in Dublin; it was the equivalent of the Welsh Eisteddfod, and became an annual event, and from this time forward the movement (which had now added to its aims a new clause—the support of Irish industries) began to go forward of its own momentum. In 1905 Dr. Hyde set out on a tour through America to collect money for the League, and returned after seven months with £11,000. On his return he was presented with the freedom of Dublin, Cork, and other cities. He was also appointed on a Royal Commission to inquire into Irish university education, including Trinity College, an institution which had been excluded from the purview of former commissions. The result of this commission was the foundation of the National University of Ireland, with three colleges (Dublin, Cork and Galway), and the Queen's University, Belfast. It was probably owing to Dr. Hyde's influence with his fellow commissioners that Trinity College, following their recommendations, established a moderatorship and gold medal in Celtic studies. He himself became professor of modern Irish in University College, Dublin.

Dr. Hyde was the first to collect the *Love Songs of Connachi*, which he published in 1894, and which he translated into verse and also into the sort of English prose afterwards adopted by Lady Gregory and by Synge. He was also the first to collect Irish folk-lore in the original; and his many volumes, some in Irish and some with English or French translations, will always be of value to the folklorist. He was also almost the first to turn to short plays in Irish as a method of popularizing the language. The first of these, *The Twisting of the Rope*, was produced in the Gaiety theatre, Dublin, in 1901, the author himself acting the principal rôle. His *Literary History of Ireland* (1899) had gone through seven impressions by 1921.

**HYDERABAD, SIR MIR OSMAN ALI KHAN, 7TH NIZAM OF** (1886– ), was born April 6 1886 and succeeded his father, Sir Mir Mahbub Ali Khan, on his death on Aug. 29 1911. His education had been under an English tutor, Sir Brian Egerton, and a nobleman of the state, of scholarly attainments, Imad ul Mulk (Saiyid Husain Bilgrami). Soon after accession he abandoned the traditional system of governing through a Diwan, and for five years was his own prime minister. In 1919 he constituted an executive council, with Sir Ali Ima, a former law member of the Government of India, as president, and with eight other members, each in charge of one or more departments. This was the beginning of various constitutional reforms, including the transformation of the nominated legislature into a mainly elective body. The great services of India's premier prince in the World War maintained the fine traditions of his predecessors as the faithful allies of Britain. When Turkey joined the Central Powers the Nizam issued a proclamation enjoining on his subjects, and impressing on his Moslem co-religionists throughout India, the duty of firm and steadfast devotion to the British cause. When the Khalifat agitation respecting the peace terms with Turkey arose among the Mahommedans he prohibited anti-British propaganda in his dominions. The large body of imperial service troops maintained by the Nizam was employed at full strength throughout the war in the Eastern theatres, and he actively coöperated in recruiting work. In addition to many gifts of money, the Nizam spontaneously bore the cost of the maintenance in the field of a cavalry regiment, 20th Deccan Horse, of which he was hon. colonel, at a cost of Rs.153 lakhs. The war expenses of the State amounted to over three-fifths of the annual income. His Highness, already a G.C.S.I., was awarded the G.B.E., was promoted to hon. lieutenant-general in the British army, and in 1918 King George V. conferred upon him the new and special title of Exalted Highness. Two features of his progressive rule must be selected for mention. To obviate possibility of repetition of the devastating floods which in 1908 caused great loss of life and property in the city of Hyderabad, and to provide adequate water supply, a great dam enclosing a lake was built across the river Musi; many fine new public buildings were erected, and the amenities of the city greatly improved. The establishment there of the Osmania University represented the first serious attempt in India to impart higher instruction through the principal vernacular, Urdu, displacing English, which was taught only as a language. (F. H. Br.)

**HYNDMAN, HENRY MAYERS** (1842–1921), English socialist and author, was born in London, March 7 1842, the son of John Beckles Hyndman, a barrister and founder of the Hyndman Trust for church building. He was educated privately and at Trinity College, Cambridge, afterwards becoming a war correspondent for the *Pall Mall Gazette* during the Austro-Prussian War of 1866. He had inherited wealth and he travelled extensively, using his pen always in defence of free institutions. In 1881 he founded the Social Democratic Federation in Great Britain and for many years was its chairman. During the 'eighties he was a prominent member of the Irish Land League and of the Land League of Great Britain. He took part in the unemployed demonstrations of 1887 and was put on trial for his share in the Trafalgar Square riot, but was acquitted. He opposed the South African War, took a prominent part in organizing the Second International in 1900, and from that date onwards was also active, both as speaker and writer, in advocating the grant of free institutions to India. But for some years before, as well as after, the outbreak of the World War, he uttered frequent warnings against the "German Menace." He published many works on socialism, land nationalization and kindred subjects, as well as *Records of an Adventurous Life* (1911), *Further Reminiscences* (1912), and *The Future of Democracy* (1915). He died in London Nov. 22 1921.

**IBÁÑEZ, VICENTE BLASCO** (1867– ), Spanish novelist, was born at Valencia in 1867. His earliest works, such as *Flor de Mayo* (1895), are pictures of provincial life in Valencia, but he later developed a realistic and minute style, reminiscent of Zola. His work is remarkable for its keen observation and power of description, and has become widely popular in England and France. His novels include *Sonnica la Cortesana* (1901; Eng. trans., *Sonnica*, 1915); *La Catêdral* (1903; Eng. trans., *The Shadow of the Cathedral*, 1909); *Sangre y Arena*, a study of the career of a bull-fighter (1908; Eng. trans., *Blood and Sand*, 1913); *Los Cuatro Jinetes del Apocalipsis* (1916; Eng. trans., *The Four Horsemen of the Apocalypse*, 1918); and *Mare Nostrum* (1918; Eng. trans., *Our Sea*, 1920).

See E. Zamacois, *Mis Contemporáneos: V. Blasco Ibáñez* (1910).

**IBN SA'UD** (*see* 2.267 and 28.245), the name of the Wahabite dynasty of Dar'iya and Riyadh (Nejd). 'Abd el 'Aziz ibn Sa'ud, the ruling emir, about 54 years of age in 1921, succeeded to the throne in 1902. The Ibn Sa'ud dynasty suffered eclipse at the hands of Ibn Rashid, emir of Hail (Jebel Shammar) from the middle of the eighties of the last century. The rightful emir, 'Abdurrahman ibn Faisal, and his son 'Abd el 'Aziz ibn Sa'ud were in exile at Kuwait, such power in Nejd as remained to the Sa'ud dynasty being wielded by an uncle, as mediatized ruler, until his murder by Ibn Rashid's order in 1902. In March 1902, with the help of Mubarak, sheikh of Kuwait, 'Abd el 'Aziz—his father stepping aside—regained Riyadh by a *coup d'état* against Ibn Rashid, who called in the Turks to aid him. Nevertheless, owing to the anarchy prevailing in Hail at the time, and with the help of the people of Nejd (who were traditionally attached to the house of Ibn Sa'ud), 'Abd el 'Aziz eventually succeeded in restoring and establishing the supremacy of the kingdom of Riyadh. Early in 1913 he extended his rule to El Hasa, driving out the Turks who had garrisoned the district since 1871. On the entry of Turkey into the World War, though the attitude of 'Abd el 'Aziz was at first uncertain, he eventually concluded a treaty with Great Britain on lines similar to those in force with the Persian Gulf states and, thereafter, proved an unswerving ally. He restored the chief towns in Nejd, rendered the roads more or less safe from raiders, encouraged cultivation, and increased the material prosperity of his dominions generally. His son, Turki, acted as his able lieutenant in the outlying districts (*see* ARABIA).

**ICELAND** (*see* 14.227*).—Since the beginning of the 20th century there has been considerable development in the affairs of Iceland, and especially in its political position, in respect of which an exceedingly important change has taken place. Instead of being as formerly (in accordance with the Danish Act of Jan. 2 1871) regarded as a territory with a wide measure of home rule, forming " an inseparable part of the state of Denmark," Iceland, since 1918, has been recognized as a separate kingdom, with unlimited sovereignty, in personal union with Denmark. According to the Act of Union (Nov. 30 1918), passed both by the Icelandic and the Danish Parliament, and in Iceland confirmed by a plebiscite, there are no real joint affairs; Denmark, however, provisionally till 1940, takes charge of the foreign affairs of Iceland as its mandatory in concert with a deputy appointed by the Icelandic Government. For the same period Danish citizens resident in Iceland and Icelandic citizens resident in Denmark enjoy in every respect equal rights with the citizens born and residing in each of these two states; they also have equal rights of fishing within the territorial waters of both states without regard to their place of residence. Other affairs of common import to the two states, such as communications, trade, the customs, navigation, mail services, telegraphs, etc., are to be arranged by agreement or treaty between the Governments of Iceland and Denmark. Iceland has issued a declaration of perpetual neutrality and of having no military or naval flag. On the other hand, Iceland, since 1915, has had its own merchant flag; this shows a white Greek cross, inside of which is another in red on a blue ground. Also, in 1918, it acquired national arms of its own, bearing the four guardian spirits of the country as described in Snorri Sturlason's *Heimskringla*, viz., a dragon, a vulture, a bull and a giant. As to diplomatic representation, Iceland has had, since 1920, a legation in Copenhagen, and is moreover entitled to establish legations or consulates at places where none have been appointed by Denmark; Icelandic attachés may also be appointed at existing Danish legations, which normally act on behalf of both Denmark and Iceland. In Iceland Denmark has a legation; Norway a consul-general and six vice-consuls; Sweden has four vice-consuls and has besides resolved to appoint either a legation or a consul-general; Great Britain a consul and four vice-consuls; France a consul and five vice-consuls; Holland two vice-consuls and Germany a consul; Russia, Belgium and Italy one vice-consul each.

According to the new constitution (1920) the king shares the legislative power with the Parliament, the *Althing*, an assembly of 42 members, of whom 36 are elected for a period of four years in separate electoral districts, where every man and woman (including servants) is entitled to vote at the age of 25; the remaining 6 (formerly nominated by the king) are elected for a period of eight years by proportional election in the whole country regarded as one constituency; in this case, however, the electoral right is limited to voters who have attained the age of 35. The Althing meets every year and sits in two divisions, the Upper and the Lower House; but in case of dissension it can assemble as a joint Parliament, in which disagreements are decided by qualified (in financial affairs by simple) majority. The Upper House consists of 14 members, the 6 members elected by the whole country and 8 elected by the other representatives out of their own body. The Lower House consists of the remaining 28 members. The Cabinet consists of three ministers, a premier and two secretaries of state, who in every respect (not only, as formerly, for the maintenance of the constitution) are responsible as well to the king as to the Althing. There is (since 1904) no governor-general, although the prime minister to some extent also acts as such, but every legislative act passed by the Althing, as well as many administrative measures, the more important appointments, etc., must be sent to the king in Copenhagen to be confirmed and signed by him; an Icelandic private secretary (not connected with the above-mentioned legation) is appointed for his assistance in such affairs. In the organization of the judicial power an important change has also taken place: appeals to the Danish supreme court in Copenhagen can no longer be made, Iceland having (since 1920) its own supreme court, consisting of five members; in consequence of this the former superior court in Reykjavik has been abolished, and appeals from the sheriff courts lie directly to the supreme court. Iceland also has its own university in Reykjavik (since 1911), consisting of four faculties: divinity, law, medicine and philosophy (including philology and history). Not only the Danish but also the French and the German Governments have appointed lecturers of their own to give lectures on their respective languages and literatures in the university of Iceland; and a similar step was contemplated in 1921 on the part of the United States. Among other improvements in education, the establishment of a teachers' seminary and of several other schools may be mentioned.

In almost every other respect Iceland in this period made constant and rapid progress. The total pop. increased from 78,000 in 1901 to 95,000 in 1921, about 43% living in towns and trading stations. There were in 1921 seven towns with chartered privileges, with a total pop. of 30,000, and 34 trading stations with from 100 to 1,000 inhabitants each. The pop. of Reykjavik, the capital, increased from 6,700 in 1901 to 18,000 in 1921. The financial budget of the Icelandic State had for the financial period of 1918–9 advanced to 27 million krónur (£1,500,000) from only 1½ million krónur in 1904–5, and deposits in the savings banks to 40 million krónur from only 2 million in 1900. Commercial transactions (import and export) had in 1918 advanced to a value of 78 million krónur from only 15 mil-

** These figures indicate the volume and page number of the previous article.*

lion in 1900. The fishing trade had been considerably improved by the introduction of new methods (especially steam trawlers and motor cutters), and the export of fish products had in 1915 increased to 67,000 tons from 28,000 in 1900. The cultivation of the soil is also constantly improving, though in a smaller degree, and dairy farming after the Danish method has been introduced, by which the production of butter has been greatly improved. Some woollen factories have been established, but capital is lacking to provide as many as are needed. In its innumerable waterfalls (the greatest and most accessible estimated to represent about 4 million horse-power) Iceland is in possession of almost inexhaustible motive-power, and it was to be expected that considerable industries might grow up in Iceland in the near future, both Danish and Norwegian companies with extensive capital having already petitioned the Althing for concessions to utilize some of the greater falls. Up to 1921, however, the water-power had only been used to produce electric light in some of the towns. Communications are constantly developing, and driving roads have been made in almost every district; bridges have also been constructed over most of the rivers (while a scheme for the construction of a railway was under consideration in 1921). A telegraph cable to Shetland was opened in 1906 and telegraph and telephone lines inland have been extended practically throughout the whole country. In 1917 a wireless telegraph station was erected in Reykjavik. The lighthouse system is yearly improving, and at Reykjavik a modern harbour with quays and cranes has been built. In 1914 Iceland acquired its own steamship company, which in 1921 controlled six mail steamers. A lunatic asylum and a sanatorium for tuberculosis (at the cost of the State), together with some minor infirmaries, have been established. From 1912 onwards there came into force a system of complete prohibition of the import and making of any liquor containing more than 2¼% of alcohol, with the exception of medical requirements and denaturalized spirits for industrial use.

**IDAHO** (*see* 14.276).—In 1920 the pop. was 431,866 as against 325,594 in 1910, an increase of 106,272, or 32·6%. The rural pop. in 1920 numbered 312,829, or 72·4% of the total, and the urban 119,037, or 27·6%, both increasing at nearly the same rate. The average number of inhabitants per sq. m. increased from 3·9 in 1910 to 5·2 in 1920. Boise, the capital and the largest city, had in 1920 a pop. of 21,303 (17,358 in 1910). The pop. of the other chief towns was as follows: Pocatello, 15,001; Twin Falls, 8,324; Idaho Falls, 8,064, and Nampa, 7,621.

Agriculture continued after 1910 to be the principal source of wealth, despite rapid developments in mining and the lumber industry. The most significant growth came in the portions of the state south of Salmon river. In northern Idaho, although the value of farm crops showed an increase in 1910–20, the total acreage remained about the same. The following table indicates the extent of agricultural development at the last three census periods:—

| | 1900 | 1910 | 1920 |
|---|---|---|---|
| Number of farms | 17,471 | 30,807 | 42,106 |
| Acreage (improved) | 1,413,118 | 2,778,740 | 4,511,680 |
| Average acreage (total) | 183·4 | 171·5 | 198·9 |
| Value of farm property | $67,000,000 | $305,000,000 | $716,000,000 |

In 1920 15·7% of the land area of the state was in farms and 53·9% of the farm land was improved. Nearly two-fifths of all farms were in the group containing between 100 and 174 ac., but this group was declining in favour of larger and smaller holdings. The average value of land and buildings per farm was $13,811 as compared with $7,955 in 1910. The number of mortgaged farms nearly doubled in the 10 years. Tenant farming was not a serious problem, for nearly 63% of all farms were operated by their owners. There were 41,598 white farmers and only 508 coloured farmers. Of the former, 35,284 were native born. The value of all crops for Idaho in 1919 was $126,459,766 as compared with $32,880,915 in 1909. Although the total value of cereals in 1919 ($43,118,428) showed an increase over 1909 ($16,026,676), it was not so marked as the increase in the value of hay and forage crops (1919, $50,807,437; 1909, $12,101,239). In the same decade the value of the potato crop increased 755·5% and of the sugar-beet crop 236%. With the increased acreage there came a decline in the average yield per acre of such crops as oats, wheat, barley and potatoes. Horticulture was important in the fertile valleys of the N. as well as in the irrigated districts of the S. and E. The production of strawberries in 1919 was 494,818 qt.; apples, 3,648,640 bus.; peaches, 279,101 bus.; plums and prunes, 485,325 bushels. Although Idaho is still important as a stock-growing state, the growth of this industry has not kept pace with the development in crop raising. The table in opposite column indicates comparative gains during the decade ending 1920.

Construction of large-scale irrigation projects received a set-back during the World War. About half the farms in the state were under irrigation in 1920. In 1909 the total acreage actually under irrigation was 1,430,000, though existing projects were capable of putting water on a total of 2,388,000 acres. In 1920 over 2,000,000 ac. were under irrigation. Incidental to irrigation has been the construction of a number of drainage projects costing (1920) $1,706,462, and providing drainage for 55,732 ac., less than one-tenth of 1% of the area of the state.

| | 1910 | 1920 |
|---|---|---|
| No. of horses | 189,322 | 293,123 |
| No. of cattle | 404,518 | 714,903 |
| No. of sheep | 1,012,431 | 1,654,771 |
| Production of milk (gal.) | 30,981,341 | 52,365,498 |
| Production of wool (lb.) | 16,377,265 | 17,860,962 |

*Mining.*—Mining continues to rank second in economic importance. The following table shows the value of the mineral production in alternate years since 1910:—

| | Gold | Silver | Lead | Copper | Zinc |
|---|---|---|---|---|---|
| 1910 | $1,018,000 | $4,268,000 | $10,761,000 | $ 753,000 | $ 33,000 |
| 1912 | 1,432,000 | 5,011,000 | 13,233,000 | 1,224,000 | 1,127,000 |
| 1914 | 1,286,000 | 7,412,000 | 13,426,000 | 2,166,000 | 685,000 |
| 1916 | 1,061,000 | 8,013,000 | 25,111,000 | 12,633,000 | 2,190,000 |
| 1918 | 750,000 | 8,709,000 | 22,368,000 | 1,278,000 | 4,212,000 |
| 1920 | 459,000 | 8,379,000 | 22,292,000 | 491,000 | 1,785,000 |

The total value of the mineral production in 1920 was $33,557,708. Lead is first in importance. The most important lead mines are in the Coeur d'Alene district of the Panhandle, including the Hercules, the Tamarack and Custer, Hecla, and Bunker Hill and Sullivan mines. The mines of central Idaho are again becoming important after the lapse of half a century, and successful developments of lead-silver and lead-zinc ores have been made in Lemhi and Custer counties in the east-central part of the state. The extraction of silver is in most sections of the state incidental to lead mining. The most striking developments in the years just preceding 1921 were in the mining of zinc. The Interstate-Callahan mine in the Coeur d'Alene is probably the third largest producer of zinc ore in the United States. Other properties in the same region have shown good yields in the past few years. Some zinc also is produced in central Idaho. The copper resources of the state, while widely distributed, are only in the first stages of exploitation, due largely to the inaccessibility of the best ores. The largest copper-producing area is in Custer county, though some development has been made in Lemhi, Shoshone and Adams counties. The Seven Devils range in Adams county is one of the most extensively mineralized copper belts in the west. Gold is produced in northern and central Idaho partly by milling quartz ores and partly by dredging. One concern, operating in central Idaho, has produced by dredging as much metal-bearing material in a year as all the lode mines in the state combined. The latter are chiefly found in the Coeur d'Alene. Tungsten in increasing amounts is being mined, chiefly in Lemhi county, which contains a more complete variety of precious, useful, and rare minerals than any other county in the state. In south-eastern Idaho are great quantities of phosphate rock, of which 30,000 tons were mined in 1920. Low-grade coal is being developed in small quantities near the Wyoming line, and there has been some prospecting for oil.

*Manufactures.*—Although Idaho is by no means a manufacturing state, there has been a marked growth during the past decade both in the number of establishments and in the value of their products. The following are the chief industries, in order of importance: lumber, flour and grist mills, car and railroad shops, printing and publishing. Over 98% of the employees are males over 15 years of age; 71% of the establishments are owned by individuals or firms and 27% by corporations. The total value of all manufactured goods in 1914 amounted to $28,453,000. Of this 47·7% was represented by lumber products. The cuts are chiefly of soft woods, 40% being white pine. Idaho contains the largest body of standing white pine in the world.

*Government.*—The Legislature of 1919 completely reorganized the state civil administration in so far as the limitations imposed by the state constitution permitted. The Administrative Consolidation Act abolished some 46 boards, commissions and offices. The resulting changes gave Idaho a consolidated form of state government, or, as it is locally called, a cabinet or "commission" form of government, with the governor at the head, assisted by nine departmental "commissioners." These nine departments are: Agriculture; Commerce and Industry; Finance; Immigration, Labor and Statistics; Law Enforcement; Public Investment; Public Welfare; Public Works; Reclamation. Each commissioner, salary $3,600, is appointed by the governor and, except "those under the constitution who are appointed for specific terms," may be removed by him at his discretion. The Act further provides that in certain departments designated officers shall be appointed by the governor, but these are com-

paratively few in number, and on the whole the organization within each department is under the control of the commissioner. This consolidated form of government concentrates authority in the hands of the governor to a marked degree. The law provides a budget system for the state, to be prepared by the Commissioner of Finance.

There were in 1920 45 counties in the state. During the 1921 session of the Legislature an effort was made to secure favourable action on a resolution to divide the state and to permit the creation out of northern Idaho, with eastern Washington and possibly part of western Montana, of a new state of Lincoln, should Congress permit the admission of the same to the Union. There was considerable agitation for this step.

*Education.*—In 1917–8 there were 131,845 pupils enrolled in the common schools of the state, as compared with 62,728 in 1905–6. The school buildings were rapidly increasing in number and in quality. In 1918 there were 1,703 school-houses valued at $9,591,609. The law permits the formation of consolidated school districts, of which there were 17 in 1918. The state university comprised in 1920 four colleges: Letters and Sciences, Agriculture, Engineering, and Law; and three schools: Forestry, Mines, and Education. The total enrolment was over a thousand. In 1917–8 the state normal school at Lewiston had an enrolment of 507; the state normal school at Albion, 403; the technical institute at Pocatello, 563.

*Finance.*—The total state tax levy for 1919 amounted to $3,795,059 on an assessed valuation of $486,759,104. The total expenditures in the same year for cost of government amounted to $3,405,929. The *Financial Statistics of States*, issued by the U.S. Census Bureau, gave a total net debt at the end of 1919 of $2,403,218. The outstanding bonds and interest-bearing warrants carried interest at 4·5, 5 and 6%.

*History.*—In the World War Idaho furnished 19,016 men, representing 26 to 30% of the total number of men examined for military service. Men from Idaho made part of the 41st National Guard Division and the 91st National Army Division. The 41st landed in France in Dec. 1917 and the 91st in July 1918. The 91st, though it spent but 14 days in active sectors, gained a total of 34 km., or 4·35% of the total ground gained against the enemy. There were 1,390 battle deaths in the 91st and 5,106 wounded. Idaho over-subscribed each of its Liberty Loan quotas. The governors of the state were: James H. Brady, Republican, 1909-11; James H. Hawley, Democrat, 1911-3; John M. Haines, Republican, 1913–5; Moses Alexander, Democrat, 1915–9; D. W. Davis, Republican, 1919–

BIBLIOGRAPHY—For the early history and exploration of Idaho, see Dale, *The Ashley-Smith Explorations and the Discovery of a Central Route to the Pacific, 1822–1829*. There are several histories of Idaho: Brosnan, *History of the State of Idaho* (1918); Hailey, *History of Idaho* (1910); McConnell, *Early History of Idaho* (1913). Of the state publications the biennial reports of the Commissioner of Finance, the Board of Education and the Mine Inspector are among the most important. On mining developments the bulletins issued by the state School of Mines (Bureau of Mines) are also valuable. (H. C. D.)

**IDRISI** (SEYYID MOHAMMED EL IDRISI), Arab chief, b. 1876 at Sabia, was a grandson of Seyyid Ahmed el Idrisi, a native of Fez, who was head of a religious fraternity or *tariqa* at Mecca and who acquired land at Sabia, settled there and died in 1837. The descendants of Seyyid Ahmed appear to have increased in wealth and influence and to have gradually supplanted the ruling sherifial family of Abu 'Arish. Seyyid Mohammed was educated partly at El Azhar University and partly by the Senussi at Kufra, and subsequently resided for a time in the Sudan, at Argo. On his return to Asir, his one ambition was to render that district independent of the Turk. By able administration he gradually expanded his political power to include Mikhlaf el Yemen and a large part of the Tihama, with control over several tribes outside these limits. He threw in his lot with the Allies in the World War, and was the inexorable foe of the Imam of Yemen (*see* ARABIA).

**ILKESTON, BALTHAZAR WALTER FOSTER, 1ST BARON** (1840–1913), British physician and politician, was born at Cambridge July 17 1840. He was educated at Drogheda and Trinity College, Dublin, where he studied medicine. He afterwards (1860) became medical tutor and professor of practical anatomy at Queen's College, Birmingham, was professor of anatomy there 1864–5, and professor of materia medica at Sydenham College, Birmingham, from 1865 to 1868. In the latter year the two colleges amalgamated, and he then became professor of medicine, and in 1892 was appointed emeritus professor of medicine. In 1886 he was knighted. In 1885 he had successfully contested Chester as a Liberal, but lost the seat in 1886; in 1887, however, he was elected for the Ilkeston division of Derby, which he retained until 1910. From 1892 to 1895 he was parliamentary secretary to the Local Government Board, and in 1906 was sworn of the Privy Council. The same year he received the gold medal of the British Medical Association. He was made a peer in 1910, and died in London Jan. 31 1913.

He published various medical works, including *The Use of the Sphygmograph in Heart Diseases* (1866); *Method and Medicine* (1870); *Clinical Medicine* (1874); *Political Powerlessness of the Medical Profession* (1883) and *Public Aspects of Medicine* (1890).

**ILLINOIS** (*see* 14.304).—The pop. by the 1920 census was 6,485,280, as compared with 5,638,591 in 1910 and 4,821,550 in 1900. The rate of increase 1910–20 was 15%, as against 14·9% for the whole United States and as against 16·9% for the state in the preceding decade. The increase of 1910–20 was urban, rural pop. continuing to decline. In 1900 the percentage of urban pop. in towns and cities of 2,500 or over was 54·3%; in 1910 61·7%; in 1920 67·9%; 35·2% of the total pop. in 1900, 38·8% in 1910, and 41·7% in 1920 was in Chicago. In 1920 52·5% of the state's pop. was in cities greater than 25,000. Population in villages of less than 2,500 declined from 12·6% in 1900 to 12% in 1910 and 10·5% in 1920. Purely rural pop. fell from 33·2% in 1900 to 26·4% in 1910 and 21·6% in 1920. The rapid growth of towns of 25,000 to 100,000 is significant, their gain in the decade being 29·2%.

*Population of Cities of over 25,000.*

| City | Population 1920 | Population 1910 | Increase per cent |
|---|---|---|---|
| Aurora | 36,397 | 29,807 | 22·1 |
| Bloomington | 28,725 | 25,768 | 11·5 |
| Chicago | 2,701,705 | 2,185,283 | 23·6 |
| Cicero town | 44,995 | 14,557 | 209·1 |
| Danville | 33,776 | 27,871 | 21·2 |
| Decatur | 43,818 | 31,140 | 40·7 |
| East St. Louis | 66,767 | 58,547 | 14·0 |
| Elgin | 27,454 | 25,976 | 5·7 |
| Evanston | 37,234 | 24,978 | 49·1 |
| Joliet | 38,442 | 34,670 | 10·9 |
| Moline | 30,734 | 24,199 | 27·0 |
| Oak Park village | 39,858 | 19,444 | 105·0 |
| Peoria | 76,121 | 66,950 | 13·7 |
| Quincy | 35,978 | 36,587 | −1·7 |
| Rock Island | 35,177 | 24,335 | 44·6 |
| Rockford | 65,651 | 45,401 | 44·6 |
| Springfield | 59,183 | 51,678 | 14·5 |

*Agriculture.*—While the census of manufactures of 1914 showed Illinois to be an industrial rather than an agricultural state, the value added to her manufactured products by manufacture making a total of $907,139,412 as against a value for agricultural products of $586,517,053 for 1910, there has been no absolute decline in her agriculture. True, the population gainfully engaged in agriculture fell from 32% of all employed in 1890 to 19% in 1910; but the average annual value of field crops grew from $129,890,293 for 1895–9 to $518,227,210 for 1915–7. One cause, other than higher prices, for this increase, in the face of a decreased number of farm labourers, appears in the increased efficiency and utilization of farm machinery; from 1890 to 1910, in spite of price reductions, the value of implements on farms increased from $34,456,938 to $73,724,074. The machine replaced the man. The cereals are still Illinois' main crop, and maize is the leading cereal. The crop of 1917, 418,000,000 bus., grown on 11,000,000 ac., was the largest. In 1918 and 1919 crop and acreage decreased, the 1919 crop being 301,000,000 bus. grown on 8,600,000 ac. That Illinois in these last two years ranked second to Iowa for the first time since 1890 was due to her turning her efforts to war-time wheat production. First in the Union in wheat production in 1889, she had fallen in 1900 to 14th place, but from a product of 30,850,000 bus. grown on 1,650,000 ac. in 1917, she rose to 60,991,000 bus. grown on 2,774,000 ac. in 1918, and in 1919 to 65,675,000 bus. grown on 4,184,000 ac., an achievement which placed her second only to Kansas. In oats her production declined steadily from the high-water mark of 1900, 164,909,129 bus., until the outbreak of the World War. In 1917 she produced 239,200,000 bus., which had fallen off by 1919 to 123,060,000 bus. from an acreage slightly larger than that of 1900. Since 1917 Illinois has been second only to Iowa in the production of this crop. In 1919 she

ranked 8th in the production of barley and rye, producing 3·45% of the barley and 4·66% of the rye grown in the United States. In live stock Illinois, Jan. 1 1920, with 1,060,000 milch cows, ranked 7th among the states; and in other cattle, numbering 1,290,000, ranked 13th. On the same date she ranked 18th in number of sheep, with 1,010,000 of the 48,615,000 in the United States. In swine she ranked second only to Iowa, having 5,323,000, a little over 7% of the total for the nation. In total value of cattle, sheep, and hogs on farms Jan. 1 1920, $294,000,000, she fell below Iowa, Texas and Wisconsin only. In value of the 1,422,000 horses and 147,000 mules on her farms on Jan. 1 1920 she was second only to Texas.

*Manufactures.*—In value of manufactures Illinois since 1893 has ranked third, being exceeded only by New York and Pennsylvania. In 1914 the total value of her manufactured products was $2,247,322,819 and the value added by manufacture $907,139,412. Manufactures employed 506,943 wage-earners, working in 18,388 establishments. There were 124 distinct industries reporting products yearly in excess of $1,000,000 each. The 25 exceeding $20,000,000 ranged as follows:—

MANUFACTURED PRODUCTS, ILLINOIS, 1914

| | Number of Establishments | Average Number of Wage-earners | Value of Products | Value Added by Manufacture |
|---|---|---|---|---|
| Slaughtering and meat-packing | 98 | 31,627 | $489,230,324 | $77,215,741 |
| Foundry and machine-shop products | 1,371 | 55,261 | 141,328,624 | 80,722,363 |
| Printing and publishing | 2,722 | 32,838 | 112,833,427 | 79,555,812 |
| Clothing, men's, including shirts | 604 | 35,119 | 89,144,448 | 47,833,982 |
| Agricultural implements | 73 | 19,556 | 65,337,663 | 32,460,102 |
| Iron and steel, steel-works and rolling-mills | 25 | 15,408 | 64,995,121 | 25,057,057 |
| Cars, steam-railway, not including operations of railway companies | 23 | 18,000 | 61,315,638 | 20,886,871 |
| Liquors, distilled | 7 | 855 | 51,596,022 | 42,989,814 |
| Flour-mill and grist-mill products | 406 | 2,398 | 49,493,224 | 6,652,317 |
| Electrical machinery, apparatus and supplies | 142 | 16,483 | 45,667,456 | 26,288,292 |
| Bread and other bakery products | 2,278 | 10,404 | 45,250,060 | 21,611,189 |
| Lumber and timber products | 618 | 14,870 | 42,064,008 | 17,939,874 |
| Cars and general shop construction and repairs by steam-railway companies | 94 | 28,682 | 41,496,130 | 23,177,666 |
| Liquors, malt | 89 | 5,749 | 39,435,995 | 29,029,583 |
| Furniture and refrigerators | 283 | 13,766 | 32,999,567 | 17,286,793 |
| Gas, illuminating and heating | 75 | 3,890 | 28,170,560 | 20,135,071 |
| Tobacco manufactures | 1,622 | 7,653 | 26,036,729 | 15,982,887 |
| Iron and steel, blast furnaces | 5 | 1,450 | 25,861,528 | 4,067,381 |
| Copper, tin and sheet-iron products | 508 | 7,445 | 24,815,389 | 10,990,536 |
| Paints and varnishes | 72 | 2,110 | 24,488,449 | 9,011,951 |
| Confectionery | 147 | 5,009 | 22,138,559 | 10,043,926 |
| Coffee and spice, roasting and grinding | 34 | 1,193 | 22,044,588 | 4,950,998 |
| Butter, cheese and condensed milk | 267 | 1,755 | 21,792,220 | 3,556,588 |
| Soap | 27 | 2,144 | 21,420,035 | 6,167,142 |
| Clothing, women's | 241 | 8,113 | 20,750,550 | 9,531,354 |

In four of these industries—slaughtering, agricultural implements, distilled liquors and railway cars—Illinois in 1914 ranked first among the states. In the relative importance of the industries in Illinois there have undoubtedly been great changes since 1914. War-time demands had far-reaching effects; and prohibition greatly curtailed the output of distilled liquors, firms engaged in their manufacture often turning to some related line such as the production of alcohol for industrial purposes. The tendency in manufacturing is toward large-scale production and corporate ownership. In 1914 the 32·6% of manufacturing establishments that were corporations produced 90% of all manufactured products. Of the 18,388 establishments in the state in the same year, the 336 producing $1,000,000 or over turned out 59·7% of products. Of the mergers during the boom period 1902–3 those in harvesting machinery and iron and steel have endured; but the National Packing Co., made up of three great Chicago packing-houses, was dissolved in 1912. Chicago, with its tributary manufacturing suburbs of Maywood, Harvey, Cicero, Blue Island, Chicago Heights, and in Indiana Hammond and Gary, is the greatest manufacturing centre of the state. A lesser manufacturing centre has grown up in the net of railways that centres at St. Louis in the cities of Alton, Belleville, East St. Louis, Collinsville, Granite City and Edwardsville. A third centre is formed by Moline and Rock Island with Davenport, Ia. Peoria and Joliet were second and third to Chicago in value of products in 1914. Of manufactures at these various points, those of Chicago, as might be supposed, are completely diversified. The same is usually true of the smaller cities, though a few are noted for special products. Thus Rockford is best known for its furniture manufactures, Elgin and Springfield for watches, Moline for automobiles and farm implements, Kewanee for boilers and steam tools, Peoria for distilled products, and Aurora for railway repair, and foundry and machine-shop products.

*Minerals.*—In mining and allied interests Illinois occupies an important position. Her petroleum production in 1917 was 15,776,860 bar., valued at $31,300,000. In this field she was 5th, being exceeded by Oklahoma, California, Kansas and Texas. In coal production, with 86,000,000 tons valued at $162,281,822, she was exceeded only by Pennsylvania and West Virginia.

*Communications.*—For transportation Illinois mainly relies on its steam railways. With 12,140 m. of main line she was in 1914 second only to Texas. For over 30 years little new main line has been built. The important extension has been in double-tracking and improvement of the right-of-way and terminals. The field of passenger and light freight and coal transport since 1900 has been invaded by electric lines, which by 1916 operated 2,415 m. of main track. The Illinois Traction System operates a ramification of electric lines crossing the state from Danville to East St. Louis and radiating through central Illinois; on certain runs it operates sleeping and parlour cars. Illinois' most important water transportation system is that of the Great Lakes. Receipts of grain at Chicago by lake have steadily declined of late years, though the lakes are still the usual route for shipment of wheat to eastern points. Flour shipments by lake are comparatively insignificant, an important fact in view of the increasing quantity of grain milled at Chicago. Iron ore still comes to Chicago and South Chicago by boat. Other water transportation in Illinois is comparatively insignificant. Trade on the Ohio is small; on the Mississippi negligible. The Hennepin canal, completed in 1907 to connect the Illinois and the Rock rivers, is unused. The Illinois and Michigan canal, though exercising a restraining effect on freight rates, has steadily declined in usefulness for the last 30 years and has not paid expenses of operation and maintenance for more than 40 years. The Chicago sanitary and ship canal, opened in 1900 as far as Lockport, has had a little more traffic. The improvement of Illinois roads has of late years engaged attention. A state highway commission was created in 1905 to investigate the subject, various laws facilitating local road improvement were passed, and in 1914 state appropriations for hard roads were made from the proceeds of automobile licence fees. Actual construction was begun in 1914. Road-building has continued, certain counties, such as Vermilion and Cook, making bond issues and constructing hard-road systems of their own. Acts of Congress of 1916 and 1919, apportioning Federal aid in behalf of roads, allotted to Illinois $3,300,000 and $8,700,000 respectively. The question of issuing $60,000,000 in bonds based on automobile licence fees for the construction of 4,800 m. of hard roads was submitted to the voters of the state in Nov. 1918 and approved by them, and work has begun on Federal aid and bond issue.

*Banking.*—The northern part of Illinois lies in the 7th Federal Reserve District and the southern part in the 8th, with headquarters respectively at Chicago and St. Louis. In 1919 there were 472 national banks in Illinois with aggregate capital of $79,415,000, surplus of $57,632,000 and total assets of $1,587,634,000; $845,925,000 of this was located in Chicago, where one bank had a capital of $21,000,000 and another $10,000,000. Side by side with the national banks was a system of state banks created by the Act of 1887 and operating under the supervision of the auditor of public accounts. The minimum capital required was $25,000 in towns of less than 5,000 inhabitants and $50,000 in larger ones. In 1920 there were 1,018 state banks with total capital of $116,879,205 and total resources of $1,861,466,834.23. Besides these there have been many private banks under no supervision. Their number has been

uncertain, but in 1915 there were at least 586. Failures in this class have been frequent, and Acts passed in 1917 and 1919, and ratified by popular vote in the elections of 1918 and 1920, require all such banks to cease business or submit to state supervision.

*Government.*—Despite the difficulty of changing the organic law, in the period 1910–20 there were far-reaching changes in the organization of the machinery for government. Under the constitution of 1870 an amendment must be initiated by two-thirds of both Houses in the General Assembly and approved by a majority of all persons voting at the next election, a provision that in 1916 caused the loss of an amendment increasing the General Assembly's taxing powers because it received a majority only of those voting on the question. Further, in a session an amendment to but one article can be proposed and no two amendments to any article can be offered within four years. Revision of the constitution by amendment therefore proved too difficult, and in 1917 the General Assembly voted to submit to the people the question of a constitutional convention, which was approved at the election of Nov. 1918. Accordingly in 1919 an Act was passed for a convention to meet Jan. 6 1920. Difficulties arose between the delegates from Chicago and those from the southern part of the state over proposals to limit Chicago's representation in the General Assembly, and in Dec. 1920 the convention adjourned with its work unfinished to meet in Sept. 1921. Important changes in the state's system of appointments were effected. First in time was the extension by the Act of 1911 of the civil service system, established six years before in the state charitable institutions, to the greater part of the state's employees. Civil service now covers all state appointees except those appointed by the governor and confirmed by the Senate, the scientific and academic staff of the university of Illinois and the normal schools, and a few others, such as special attorneys appointed by the attorney-general. All examinations are competitive, though for some scientific posts "unassembled examinations" are given which consist of questions as to training and experience. By an amendment of 1917 all appointees may be removed by the appointing authority, but are allowed an appeal to the State Civil Service Commission on allegation that the removal is due to race, politics or religion. Reorganization of governmental machinery had begun in 1909 with the abolition of separate boards for the various state charitable institutions and the establishment of one central board of control possessing also certain powers over private charitable institutions. In addition to this board a supervisory state charities commission was created. There remained, however, more than a hundred state boards, bureaus and offices, paid and unpaid, created to execute various acts and to supervise various state institutions; the result was disorder and waste. A reorganization recommended by an efficiency and economy committee in 1914 was in great part adopted in the State Consolidation Act of 1917. This Act necessarily left untouched the constitutional offices, secretary of state, auditor of public accounts, treasurer, attorney-general, and superintendent of public instruction, but set up in addition to them nine departments—Finance, Agriculture, Labor, Mines and Minerals, Public Works and Buildings, Public Welfare, Public Health, Trade and Commerce, Registration and Education. The heads of these various departments, who are appointed by the governor and Senate, have acted as a Cabinet for the governor.

*Suffrage and Elections.*—The most important development since 1910 has been the complete enfranchisement of women. Initiated by the Act of 1891, which allowed women to vote in elections of school trustees, it was continued by the Act of 1909, making women eligible to all offices under the school law of the state. In 1913 the General Assembly extended to women the franchise for presidential electors, members of the board of equalization, for all state offices not already open to them by the constitution and for offices in cities, villages and towns. Enfranchisement was completed by the Federal constitutional amendment of 1920. In legislation as to primaries the state has had difficulty in procuring constitutional laws. Acts of 1905, 1906 and 1908 were invalidated by the Supreme Court. An Act passed in 1912 stood the test, but a further Act passed in 1919 was declared unconstitutional.

*Public Finance.*—For the biennium 1916–8, the last for which statistics are available, the total revenue of the state in respect of the General Revenue Fund was $41,856,721. Of this the general property tax supplied $27,532,790, the 7% of Illinois Central Railroad earnings $3,775,240, the inheritance tax $3,848,174, subventions by the Federal Government $330,215; the balance was the proceeds of fees, fines, receipts from state institutions, etc. In addition to the General Revenue Fund the receipts of the state in respect of certain other special funds amounted to $19,912,132. Of these the receipts for the state school fund were $7,911,653, the proceeds of the special mill tax for the university of Illinois $4,847,202, the receipts from automobile licence fees used for hard roads $4,353,090, and receipts to be applied toward registered bonds guaranteed by the state $1,897,400. Expenditures for the biennium 1916–8 based on both groups of funds were $47,919,125; when classified by state departments the largest were those for registration and education, $15,409,692, which included disbursements for the university of Illinois and the state school fund. The expenditure of $14,831,833 for public welfare included expenditures on the charitable and penal institutions of the state. The other large totals were: state officers, $4,217,448; public works, $3,083,850; administration, $2,462,031; registered bond fund, $2,062,823; military, $1,704,207; trade and commerce, $1,198,713; agriculture, $1,023,285.

*Education.*—In 1918 there were enrolled in the elementary schools of Illinois 490,762 boys and 478,185 girls; in the state high schools 50,107 boys and 62,450 girls. The total number of teachers was 34,597. The estimated value of school property was $154,619,859, of which $10,553,848 represented equipment, furniture, etc. Total funds available were some $68,000,000, and expenditures in school districts some $52,000,000, of which $1,294,537 was spent on administration, $29,001,198 for instruction, $5,961,635 for operating plant, $8,745,373 for new buildings and equipment, $3,236,889 for repairs, etc. Teachers' salaries were low. In 1918 over one-half the elementary-school teachers were paid between $300 and $700. Such conditions result in unsatisfactory professional standards: 1,015 teachers in 1918 had attended no school above elementary; 1,787 had attended, but not graduated from, a high school; 9,631 were high-school graduates. Even with such meagre qualifications, there was a serious shortage of teachers in the state. The most significant development in recent years has been in high-school education. Acts of 1913 and 1915 directed the payment by local school authorities of tuition for children who wish to attend high school elsewhere when there was none in their district. In 1917 an Act was passed making easier the establishment of country high schools and laying a tax on the community for the payment of tuition to other high-school districts in which the community's children attended high school. An adverse decision of the state Supreme Court caused the reënactment of the measure in different form in 1919. As a result of this legislation the numbers of high schools, students and teachers have doubled since 1906:—

| | High Schools | Students | Teachers |
|---|---|---|---|
| 1906 | 438 | 52,394 | 2,057 |
| 1918 | 840 | 112,257 | 5,476 |

There has been a corresponding increase in the enrolment in the universities and colleges of the state, notably in the university of Illinois, the capstone of the state's educational system. The university enrolment between 1910 and 1920 rose from 5,217 to 9,208. Appropriations have failed to follow this increase, with the result that, with an annual revenue of $3,967,848.20 as against $2,002,038.23 in 1910, the university found itself badly crippled. In spite of this it performs an ever-increasing variety of services to the state. Not only in its colleges and graduate schools does it train teachers, chemists, and engineers for the benefit of the state, but its special schools of agronomy, animal husbandry and dairy husbandry cooperate with the farmers of the state in solving their problems. Its schools of ceramics, civil, electrical, mechanical, mining, municipal, sanitary and railway engineering and architecture devote themselves to the study of the state's problems. By various research bureaus and surveys, such as the State Geological Survey, it conducts research for the benefit of the state. Of the other two large universities of the state, the university of Chicago in 1919–20 had a total enrolment of 10,880, with a faculty, exclusive of assistants, of 328. Its total assets exceeded $50,000,000; its library included 900,000 books and pamphlets (*see* CHICAGO, UNIVERSITY OF). Northwestern University, located in Evanston and Chicago, had a total registration in 1920–1 of 7,389, and a faculty of 389, exclusive of assistants. Its libraries included over 300,000 books and pamphlets. Its annual expenditure was $1,398,084.

*History.*—In 1912, as a result of the Progressive secession, the Republican party for the first time in 16 years lost control of the state, the Democratic presidential electors winning by a vote of 405,038, as against 386,478 for the Progressives and 253,593 for the Republicans. The Democratic state ticket headed by Edward F. Dunne was elected by a somewhat larger plurality over Gov. C. S. Deneen, Republican, and Frank H. Funk, Progressive. The Democrats, however, did not control the General Assembly on joint ballot and had to compromise with the Republicans on the election of one Democratic senator, James Hamilton Lewis, and one Republican, Lawrence Y. Sherman, the latter to fill an unexpired term to 1915. By 1914 the normal Republican majority in the state reasserted itself, the popular vote for senator in that year being L. Y. Sherman, Republican, 390,661; Roger Sullivan, Democrat, 373,403; Raymond Robins, Progressive, 203,027. Wilson lost the state in the presidential election of 1916 by 160,000 votes, Frank O. Lowden, Republican, being elected governor over Edward F. Dunne. In spite of the appeal for the support of the Wilson administration on patriotic grounds, but five Democratic congressmen were elected in 1918, and Medill McCormick, Republican, beat J. H. Lewis, Democrat, for senator by 53,024 votes. In 1920, after an extremely bitter primary fight in the Republican party, Len Small was nominated for the governorship over John J. Oglesby, Small running on a platform opposing the action of the Public

Utilities Commission in allowing increase of rates by public utilities, and advocating increased taxation of wealth. In the election Republican state and national tickets swept the state by overwhelming majorities, though Lewis, the Democratic candidate for governor, ran ahead of his presidential ticket.

The governors of Illinois after 1905 were: Chas. S. Deneen, 1905–13; Edward F. Dunne, 1913–7; Frank O. Lowden, 1917–21; Len Small, 1921– .

*World-War Activities.*—Under the vigorous leadership of Gov. Lowden, Illinois supplied 188,010 drafted men and 163,143 volunteers, a total of 351,153, to the armed forces. The 33rd Division, made up of Illinois National Guard units, saw service in France both on the British front and in the Meuse-Argonne offensive. The 140th Field Artillery, originally the 1st Illinois Artillery, was in the 42nd Division and took part in many engagements; the 13th, or Railway, Engineers and several other Illinois units also saw service in France. One divisional cantonment, Camp Grant at Rockford; the great naval recruit training depot at Great Lakes, Lake Bluff; Fort Sheridan, near Chicago, utilized first as an officers' training camp, then as a hospital; Chanute and Scott aviation fields at Rantoul and Belleville, together with various other camps and training centres, were located in the state.

The organization of the state for participation in the war was the work in great measure of the state Council of Defense, created by Act of the General Assembly, and representing capital, labour and other interests. Over 110,000 volunteer workers affiliated themselves with this body. Under its direction the agriculture of the state was turned with unexampled success to the production of wheat, barley and rye. The manufactures of the state also were reorganized for war purposes. Citizens of the state subscribed $1,586,227,500 to Liberty Loans, exceeding the state's quota by 28%, and gave more than $50,000,000 to war relief agencies. The universities and colleges of the state organized students' army training corps, gave their students to the officers' training camps and their specialists to all phases of Government activity, from experts' work at the Peace Conference to chemical experiment and railway operation.

See, in addition to the books listed in 14.311, *Centennial History of Illinois* (5 vols., published by the state 1918–20) and later volumes of the *Illinois Historical Collections*. (T. C. P.)

**ILLUMINATING ENGINEERING.**—The formation of the Illuminating Engineering Society in England in 1909 gave a great stimulus there to the study of illumination. A body with similar aims had existed in the United States since 1906. Illuminating engineering societies have also been formed in Germany (1912) and in Japan (1918). These bodies include in their programme the study of illuminants, the influence of light on the eye, the measurement of light and illumination, and practical applications of light. A notable step has been the formation, on the proposal of the British Illuminating Engineering Society, of the International Illumination Commission, with national committees in all the chief countries. Work was in abeyance during the World War but has since been resumed. Agreement on a common unit of light (the "International Candle") has been attained in Great Britain, France and the United States. In Germany the Hefner candle (equal to 0·9 "international" candle) is still used.

Researches have led to a more accurate knowledge of the influence of humidity and barometric pressure on the 10-c.p. Pentane standard (*see* Trotter, Haldane and Butterfield, *Int. Phot. Comm.*, 1911; C. C. Paterson, Phys. Soc. Lond., June 1909; Crittenden and Taylor, *Trans. Illum. Eng. Soc. U.S.A.*, 1913; Takatsu and Tanaka, Electrot. Laby. of Dept. of Communications, Tokyo, 1917). Meantime the search for an absolute standard of light continues. Recent work by N. A. Allen (Phys. Soc. Lond., 1920), indicating under favourable conditions the maintenance of a constant current-density in the crater of the carbon arc, suggests the possibility of an arc-standard. At the Reichsanstalt in Charlottenburg experiments on the use of a dark hollow space, forming a "black body," maintained at a constant temperature, have been conducted (Müller, *Licht und Lampe*, April 21 1921). Many instruments for measuring illumination, including forms suitable for direct measurement of brightness, are now available. Some recent types, intended for rapid and approximate work, enable values of illumination to be read off directly by the inspection of a series of slots of graded brightness without manipulation to obtain balance. An instrument of this type was used to determine the illuminating power of parachute lights, flares, etc., during the World War; and other special apparatus for studying the decay of brightness of radium self-luminous material has been developed (Trotter, *Illum. Eng.*, Nov. 1919). Daylight illumination has also been studied by apparatus relating illumination at any point in the room to the unrestricted illumination from the sky-hemisphere. The "daylight-factor" thus determined may be of the order of 0·25% in schools, and this has been suggested as a standard minimum of access of daylight (*Illum. Eng.*, Jan., Feb., July 1914).

Greater experience has been gained of the practical operation of the integrating sphere photometer for measuring mean spherical candle-power or total flux of light in lumens. It is now recognized that, in view of the great variations in mode of distribution of light from modern illuminants, comparisons should be made in terms of total light emitted, or average candle-power, and not candle-power in one direction only. Accordingly the integrating sphere has assumed greater importance. Various methods of applying this apparatus to determine absolute coefficients of reflection of surfaces have been evolved (A. H. Taylor, *Sci. Paper*, Bureau of Standards, 1920; *Trans. Ill. Eng. Soc. U.S.A.*, Dec. 1920). These researches assign to magnesium carbonate the high coefficient of reflection of 99%, and this has been proposed as a standard photometric surface.

Attention has also been devoted to physiological aspects of illumination, such as the avoidance of glare from bright unshaded lights in the range of vision, the effect of infra-red and ultra-violet rays, etc. Problems involved in the lighting of shops, schools, streets, factories, theatres, etc., have been discussed and in some cases recommendations issued by joint committees. Thus a joint committee representing the Illuminating Engineering Society, the Institutions of Gas and Electrical Engineers and the Institution of County and Municipal Engineers prepared a draft standard specification for street lighting, streets being classified in order of importance and appropriate minimum values of horizontal illumination specified in each class (*see* Trotter, *Illum. Eng.*, May, June 1913). Reports of joint committees on school and library lighting (*Illum. Eng.*, July 1913) and eyestrain in cinema theatres (June 1920) have also been issued.

There has been a growing recognition of the importance of adequate illumination in factories in the interests of health, safety and efficiency. In England, the Departmental (Home Office) Committee on Lighting in Factories and Workshops issued an interim report in 1915 (Blue Book Cd. 8000), recommending that there should be statutory power "requiring adequate and suitable lighting in general terms in every part of a factory and workshop. . . ." The report contained full data on industrial lighting and results of upwards of 4,000 measurements of illumination in factories, and ranks as one of the most important official documents on this subject. In subsequent years industrial lighting codes have been adopted by six of the American states. It has been suggested that ultimately an international code may be developed.

During the World War the Illuminating Engineering Society exerted its influence in favour of judicious lighting economies and scientific methods of darkening streets. An increase in street accidents was attributed partly to inequalities of lighting prevailing in the streets of London (*Illum. Eng.*, Jan. 1917, p. 38). War conditions imposed a check on the development of spectacular lighting in England, but novel forms of illuminated signs, particularly those of the pictorial variety, have since been developed (E. C. Leachman, *Illum. Eng.*, March 1921). The lighting of the Panama-Pacific Exposition, opened at San Francisco in 1915 (*Gen. Electric. Review U.S.A.*, June 1915), was regarded as marking a new era in spectacular lighting, many striking colour effects being devised.

Additional information on illuminating engineering may be derived from the following works:—

(See also LIGHTING, ELECTRIC.) (J. S. D.)

**IMMINGHAM,** a capacious deep-water dock situated on the Lincolnshire shore of the Humber estuary, 9 m. S.S.E. of Hull and 5 m. N.N.W. of Grimsby, England. Constructed by the Great Central Railway Co., the dock in 1921 comprised a square basin and two long arms (including a graving dock) running parallel to each other on the western side, of a total area of 45 ac., with 5,400 ft. of quayage; the depth, ranging from 30–35 ft., is sufficient for practically any vessel afloat. The dock is specially designed and equipped for dealing with the coal, timber, grain and wool trades. Construction was begun in 1906 and the official opening by the King took place on July 22 1912.

The area of the dock property, 2½ m. in length and 1 m. in greatest depth, is just over 1,000 ac. with a river frontage of 1¼ miles. Railway sidings extend to 172 m. and have a capacity for 16,850 waggons carrying upwards of 174,000 tons of coal. The particular site of Immingham was chosen because the deep-water channel of the Humber, which lower down runs midway between the shores, here makes an inward sweep and leads right to the dock gates, thus obviating much initial dredging, providing ingress and egress at any state of the tide, and rendering the towage of the vessels unnecessary.

The entrance lock, 840 ft. in length and 90 ft. broad, has a depth ranging from 47 ft. at high water to 27 ft. 6 in. at low water of spring tides, and is furnished with three sets of gates. Long jetties spring out on either side of the entrance, curving round about midway in order to run parallel to the river, thus forming a huge funnel-shaped entrance; the eastern jetty forms a landing-stage for passenger traffic and the western is designed for the shipment of bunker and cargo coal. Eight hydraulic hoists, of the most up-to-date pattern, are capable of shipping 5,600 tons of coal per hour.

There is an immense granary and a wool warehouse with capacity for 40,000 bales. A new town is springing up near-by—the original village of Immingham lies a little inland. The Grimsby electric tramways have been extended to Immingham and, in addition, a light railway runs between the two places.

**IMMUNITY,** in pathology (*see* 3.175).—During the year 1920 a very interesting contribution to the study of immunity was published by Dr. Besredka of the Pasteur Institute in Paris. The importance of this contribution lay in the fact that a cellular basis as opposed to a blood basis for immunity was suggested. Besredka in the course of experiments with dysentery bacilli found that the bacilli, whether injected into a vein or under the skin or given by the mouth, always made their way to those areas of the alimentary canal in which dysentery lesions are commonly found. Moreover, damage was confined to these regions.

One of the claims advanced for artificial immunization, *e.g.* by vaccines, is that by raising the resistance of the system to a particular microörganism any attempt by that microörganism to invade the body will be localized. In the Paris experiments, however, localization took place of itself. Thus it would seem that the dysentery organism was able to exercise its malign influence only when in contact with a highly specialized form or type of tissue. No matter where the bacilli entered the system the result was the same. There was no effect, or but little effect, until the tissues of the bowel were reached. The effect was then the one usually associated with an attack of dysentery.

This series of experiments suggested what may be called a tissue affinity for particular microörganisms. Thus, a bacillus $x$ being postulated, it would be possible to describe any particular tissue as $x$-sensitive or $x$-resistant. This idea naturally led to the formulation of another question. If reaction is located in special tissues, is immunity also located in these tissues? In order to answer it Besredka gave injections of killed dysentery bacilli (Shiga's) to a number of rabbits. In those rabbits which had a single ingestion of dead bacilli the agglutinin, after 18 days, reached a maximum of 1–200, and after a month it fell to the normal 1–50. A second ingestion was followed by no further effect. The blood showed no trace of agglutinins.

The specific agglutinin formed in the blood in response to an infective agent is of the character of an antidote, using that word in its widest sense. Thus it appeared that the "protection" afforded by ingestion of dysentery bacilli by rabbits was of a very short-lived character, and further that the renewal of the ingestion, so far from increasing the small quantity of agglutinins, was followed a month afterwards by their complete disappearance. Nor did the serum of these rabbits contain any preventive anti-body, for when injected into mice which were afterwards inoculated peritoneally with fatal doses of dysentery bacilli it had no more preventive power than normal serum.

Thus it appeared that after one ingestion of these organisms the intestines of the animal refused to absorb any further quantity. This in a measure pointed to the development of a localized power of resistance. It was resolved to test the matter further by seeing how these rabbits, which carried in their blood neither agglutinin, preventive anti-body nor apparently any other anti-body, behaved when a fatal dose of dysenteric virus was injected into their veins.

The resulting experiments showed that both the rabbits which had had a single injection of killed bacilli (and had a small amount of anti-body in their blood) and those which had had two ingestions (and had no anti-bodies in their blood) behaved in the same way on receiving the intravenous injections of living bacilli. They were solidly protected and showed no ill effects, while, on the contrary, control animals all died within 24 hours.

This seemed to increase the evidence in favour of a localization not only of sensibility but also of resistance or of reaction. Indeed, the possibility presented itself of a double protection—that of the blood and that of the tissues. Besredka believes that the tissue immunity is established in the intestine at the site of the lesions following the first ingestion. The first ingestion does not meet with the localized resistance which it serves to establish and so a part of the antigen reaches the blood and there gives rise to anti-bodies—the agglutinins. When, however, this break in the wall is closed up, a solid immunity is established and the "intestinal barrier" becomes unbreakable. If the ingestion is repeated no more antigen can gain access to the circulating blood and so no further formation of anti-body takes place.

Besredka thus believes that, so far at any rate as dysentery, typhoid and paratyphoid are concerned, animals have only a single means of acquiring active immunity, and no matter which mode of vaccination is adopted—oral, subcutaneous or intravenous—the resulting active immunity is invariably local, that is to say, intestinal. Vaccination is thus only efficacious when the vaccine reaches the intestinal tract, whether it comes by a vein, through the skin or through the mouth. Nor is any object served by producing general reactions and blood resistances. Indeed the method to be preferred is that of oral administration, for it reaches the required positions with minimum loss of time and with maximum security.

In another series of experiments this investigator found that the natural immunity of rabbits to Paratyphoid B. infection could be broken down if a preliminary course of ox-bile had been administered to the animals. The suggestion was that the ox-bile served to break down the localized tissue resistance, for if the bacilli (Paratyphosus B.) were injected intravenously a fatal result also followed. In this case the bacilli were found not in the blood but in the bowel wall, where they would normally have been localized. Thus there are ways (bile) of breaking down a natural localized immunity.

These researches appear to be of a revolutionary character. It is as yet too early to express final opinions on them, but they open up a wide vista of possibilities which will be explored by many workers in this field of medicine.

See "Immunity to the Enteric Fevers," Aug. 28 1920, *British Medical Journal*. (R. M. Wi.)

**INCHCAPE, JAMES LYLE MACKAY,** 1ST BARON (1852– ), British shipowner and banker, was born at Arbroath, Forfarshire, Sept. 11 1852, and educated there and at Elgin. In 1874 he was sent to India in connexion with his father's merchant business, which had branches in Bombay, Calcutta and Karachi. In India he had a distinguished career, being member of the Legislative Council of the viceroy from 1891 to 1893 and member of the Council of India from 1897 to 1911. He was created K.C.I.E. in 1894. In 1902 Sir James Mackay negotiated a commercial treaty with China which was signed at Shanghai Sept. 5 (*see* 6.207); he was then created G.C.M.G. He served on most of the Government commissions of inquiry into Indian administration, besides that appointed to investigate the question of the gold standard of Mexico, and in England he sat on the committee of inquiry into the Board of Trade and Local Government administration 1903–4, and Government workshops 1905–7. In 1911 he was raised to the peerage as Baron Inchcape, of Strathnaver. In 1912 he was appointed chairman of a royal

commission to inquire into the natural resources and improvement of Imperial trade. Before the World War broke out, Lord Inchcape was already one of the most prominent figures in the British business world, being chairman of the P. & O. Steamship Company after having been chairman of the British India line which was amalgamated with it, and a director (and acting chairman) of the National Provincial Bank, with which the Union of London and Smith's Bank was subsequently amalgamated. As a representative of the shipping industry he took a leading part in all its affairs during the war, and in assisting the Government to sell its surplus ships after the war to private owners.

**INCOME TAX** (*see* 14.356).—1. UNITED KINGDOM. The income tax position in 1910 was briefly this. The rate of the tax was 1s. 2d. in the £, and the exemption limit was £160. Earned income paid at 9d. in the £ if the total income did not exceed £2,000, at 1s. if the total income did not exceed £3,000. Earned income over the £3,000 limit, and all "unearned" income, paid at 1s. 2d. in the pound. Graduation was effected partly by a series of abatements (of £160, £150, £120, and £70 for individuals whose total incomes did not exceed £400, £500, £600, and £700 respectively) and partly by the recently introduced super-tax, which was an additional duty or income tax, centrally administered, and charged by direct assessment on the recipients of incomes exceeding £5,000. Super-tax was charged in those cases at 6d. in the £ on every pound by which the income exceeded £3,000.

It will be seen that in 1910 the principle of graduation, which, after a long struggle, had at last been definitely adopted into the income tax system, was very imperfectly applied. There were abrupt "jumps" in the effective rate immediately above the various abatement limits, but between £701 (where the abatements ceased to apply) and £5,000 (where the super-tax began) there was no graduation at all. The total yield of the tax for 1910 was £38,344,767, and the yield for each penny of the rate was £2,738,912. Super-tax produced £2,702,892 from 11,713 super-tax payers.

From this position there was no considerable change until the Finance Act of 1914 increased the rate to 1s. 3d. and made an attempt at a more complete graduation. The rate on earned income rose by five steps instead of three to the maximum rate, which was reached above £2,500; unearned incomes (graduated now for the first time) went by three steps to the maximum rate, which was charged on incomes above £500. The super-tax limit was reduced from £5,000 to £3,000, and the super-tax, instead of being charged at a uniform flat rate of 6d., was charged, on the income in excess of £2,500, at seven rates rising from 5d. to 1s. 4d. in the £ on successive "slices" of income. The children allowance was increased to £20.

The Finance Act of 1914 which made these changes—very characteristic of the natural development of the tax—was passed on July 31 1914. Next week the World War broke out.

*War Developments.*—Owing to war requirements the rate of tax rose rapidly. The second Finance Act of 1914 increased it to 1s. 8d.; the first Finance Act of 1915 to 2s. 6d., the second to 3s.; in 1916 it rose to 5s. and in 1918 to 6s. in the pound. In 1918 also the super-tax limit was put down from £3,000 to £2,500 (on the income in excess of £2,000) with a new scale of charges running up to 4s. 6d. in the pound.

But in addition to mere increases in the rate of tax the war was responsible for many other changes and developments. In 1915 the exemption limit was reduced to £130, and the "abatements" allowed to persons whose total income did not exceed £700 were reduced. This lowering of the exemption limit—which was an attempt to spread the cost of the war down the scale of incomes at the same time as the excess profits duty was laid upon the larger incomes—brought an immense number of new taxpayers under the purview of the Inland Revenue Department; and these new taxpayers were not only very numerous, but they were largely of the weekly wage earning class, a class wholly unaccustomed to the payment of any annual tax, or indeed to annual payments of any kind. To have legislated to make them pay income tax in one sum on their whole year's income would have been to invite failure. It was therefore decided to assess quarterly and to collect tax quarterly from weekly wage earners employed by way of manual labour; and presently it was arranged that payment might be made in these cases by the purchase of income tax stamps to be stuck on a card and ultimately handed in to the collector.

The war and the high rates of tax also rendered necessary the provision of special reliefs for persons whose profits were adversely affected by the war; the granting of specially low rates of tax to soldiers and sailors; payment of tax in two half-yearly instalments; a further increase of the children allowance, and the grant, for the first time, of an allowance for a wife, in order that the heavy burden of taxation should be more fairly distributed between the bachelor and the family man.
